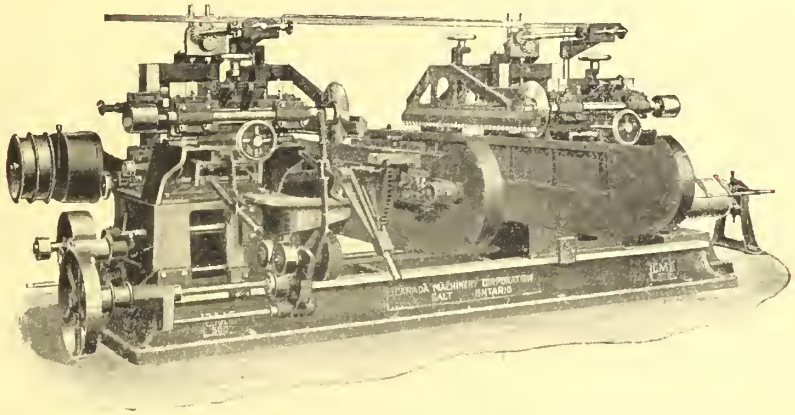
CANADIAN WOODWORKER and Furniture Manufacturer

C.M.C.

"THREE DAYS IN THREE QUARTERS OF AN HOUR"



No. 500 Double End Tenoner

One "500" user says "I have just done in three quarters of an hour what used to take me three days".

Little wonder this factory is giving its competitors cause for worry.

You can do the same on the "500".

PARTIAL LIST OF A 1 BARGAINS
IN WOODWORKING MACHINERY

Some new—others practically so—all at very attractive prices. We have many others
If you don't see what you need listed, ask us for particulars

1—Used Double Dowel Machine,
1—Used Bowmanville 4" Sash Sticker,
3—Used Machines for turning Mouldings,
1—Used Cowan Door Relisher
1—Used McGregor-Gourlay Door Clamp,
1—Used Sturtevant 36" Single Fan
1—Used " 45" Double Fan
1—Used " 48" Single Fan
7—Used Bowser Tanks,
1—Used Double Spindle Boring Machine,
1—Used Kelley Router,
1—Machinery Co. of American 5' Back Gauge,
1—Used American No. 2½ Tenoner,
1—Used Ballantine, Two Spindle Shaper,
1—Used C.M.C. No. 438 Arm Sander,
1—Used C.M.C. No. 507 Power Chisel Mortiser,
1—Used Preston 36" Band Saw.
1—Used Preston No. 127 Variety Saw Bench,
1—Used Preston No. 121 Pony Planer, 24"
1—New American No2. Disc and Spindle Sander,
1—Used Oliver No. 8 Wood Trimmer,
1— " Cowan 13" Four Side Moulder,
1— " Cowan M-277 32" Automatic Knife Grinder,
1— " Single Spindle Vertical Boring Machine
1— " Post Borer,
1— " Jackson-Cochrane Power Feed Rip Saw,
1—New American No. 30 Universal Saw Bench,
1— " " No. 25 Edging and Ripping Saw,
1— " " No. 3 Double Cut-off Saw,
2—Used American No. 229 9" Hardwood Planer and Matchers
1—Used American No. 22 Four Side Moulder,
1— " Hespeler, 10" Four Side Moulder,
1— " Houston 8" Four Side Moulder,
1— " American No. 2 Hand Feed Rip Saw,
1— " American 36" Double Disc Sander,
1— " Berlin 36" Three Drum Sander,
1—Used American 24" Jointer with power feed attachment.
1— " Dodds 10 Spindle Dovetailer,
1— " Reynolds Screw Driver,
1— " Covel No. 40 Automatic Saw Sharpener,
1— " Cowan 10" Four Side Moulder,
1— " Francis 24" Glue Spreader,
1— " Jackson-Cochrane Chair Seat Former,
1— " Four Spindle Horizontal Boring Machine,
1— " Knob Turner,
4— " Embossing Machines for mouldings
1— " Goldie-McCulloch Two Spindle Shaper
1— " Goldie-McCulloch Dowel Sticker,
1— " Revolving Bed Planer, 24"
1— " Cant-Laidlaw 8" Four Side Moulder,
1— " Cant-Gourlay 8" Four Side Moulder
1— " McGregor-Gourlay Small Self-feed Rip Saw
1— " Crescent Small Rope Moulding Machine
1— " Arm Sander,
1— " Goldie-McCulloch Single End Tenoner,
1— " Cameron & Co. Single End Tenoner,
1— " Cowan Horizontal Chisel Mortiser,
1— " Jenkins Veneer Jointer,
1— " Preston Veneer Taping Machine,
3— " Veneer Lathes, 130", 88", 54",
Swing Cut-off Saws,
Veneer Clippers,
1— " Beach Double Cut-off Saw,
1— " Box Ripping Saw Table,
1— " Elliot No. 5 Woodworker,
1x— " Merritt Re-driers,
Vegetable Glue Mixers,
Hydraulic Press,
1— " 54" Band Resaw
1— " Yates 49" Endless Bed Planer
1— " Roller Table Belt Sander
1— " Yates Double Cut-off Saw

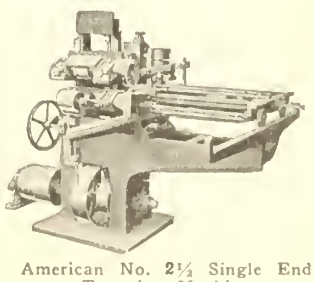
Everything in Woodworking and Metal Working Machinery



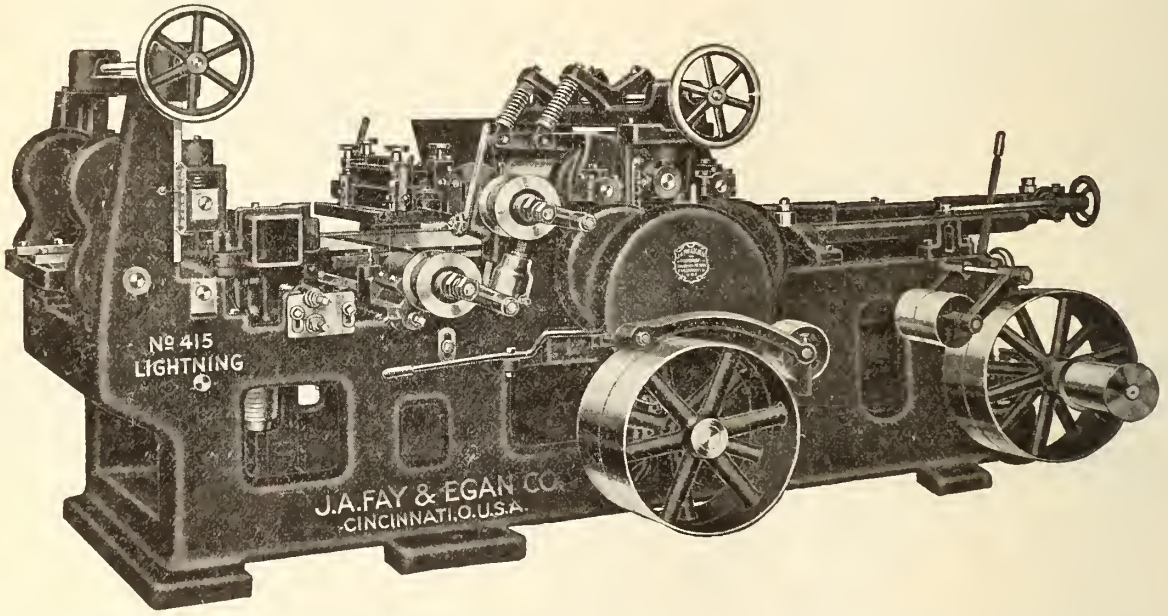
American No. 2½ Single End Tenoning Machine

The Class of Work a No. 415 Will Do Is Beyond Criticism

The greatest general purpose Planer, Matcher and Molder presented to the woodworking industry in years.

Made in Three Sizes, 16″, 20″, 24″ wide and 8″ thick.

No.415 has successfully met the requirements of Planing Mills and other woodworking plants for working hard and soft woods.



No 415 "Lightning" Fast-Feed Double Cylinder Planer and Matcher

Each belt has Gravity Tightener for taking up stretch.

Write for Bulletin C-11 for additional information.

No. 415 is easily accessible for all adjustments and for setting up, saving much valuable time every day.

"The Lightning" Line
TRADE MARK REG.

It will not tear out or raise the fuzz on knotty or cross-grained stock. First costs and operating expenses are well within the reach of any mill owner.

J. A. Fay & Egan Company

Established 1830

World's Oldest and Largest Manufacturers of Woodworking Machinery

153-173 W. Front St., CINCINNATI, OHIO

Yates

Yates

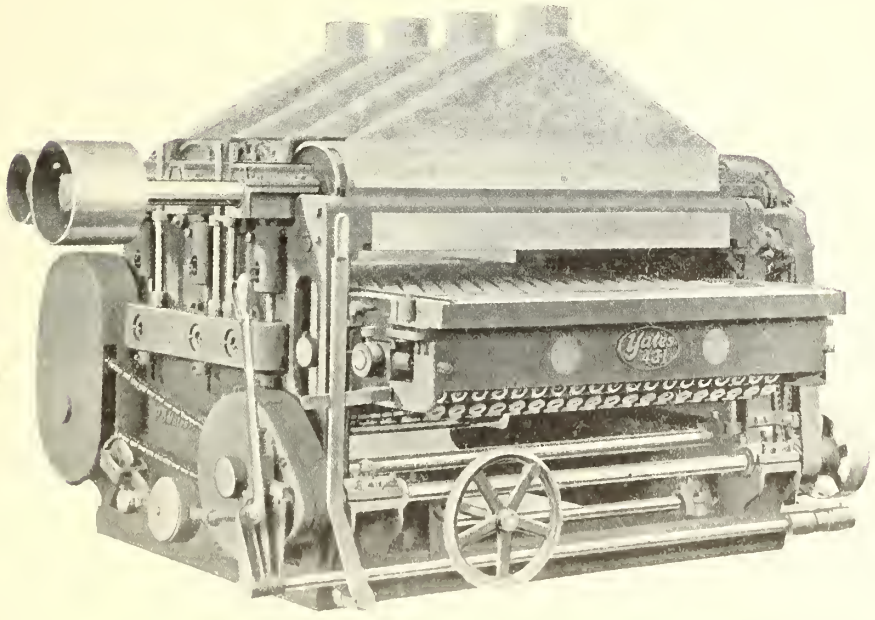
The only machine made in which the sandpaper on the drums can be tightened up at each end independently or both at the same time, also should the paper become loose it is automatically tightened while machine is in operation.

That machine is Yates No. 431 Endless Bed Sander, a machine that is especially adapted for sanding narrow and short stock. Of course it will handle the big stuff as well and give an excellent fine finish.

It will take stock short as 3 inches and thin as ¼ inch which can be automatically fed by the endless bed. Built in three sizes 31-43-49 inches wide.

Our Sander-Book explains this fully and we will gladly send you one for the asking

P. B. Yates Machine Company Ltd.
HAMILTON, ONT. CANADA



YATES

MAPLE LEAF SAWS

Maple Leaf Saws will give you just that steady, day-in-day-out service that means so much in your plant. They are made with this object in view. The whole process of their manufacture, from the selection of the highest grade steel to the time they leave our hands is attended to with the greatest care.

The complete line includes Bands, all kinds of Special Saws for Special Work, Cross-cut Saws, Gang Saws, Dado Heads, etc. Every one guaranteed to merit your approval.

Write for a copy of our catalogue.

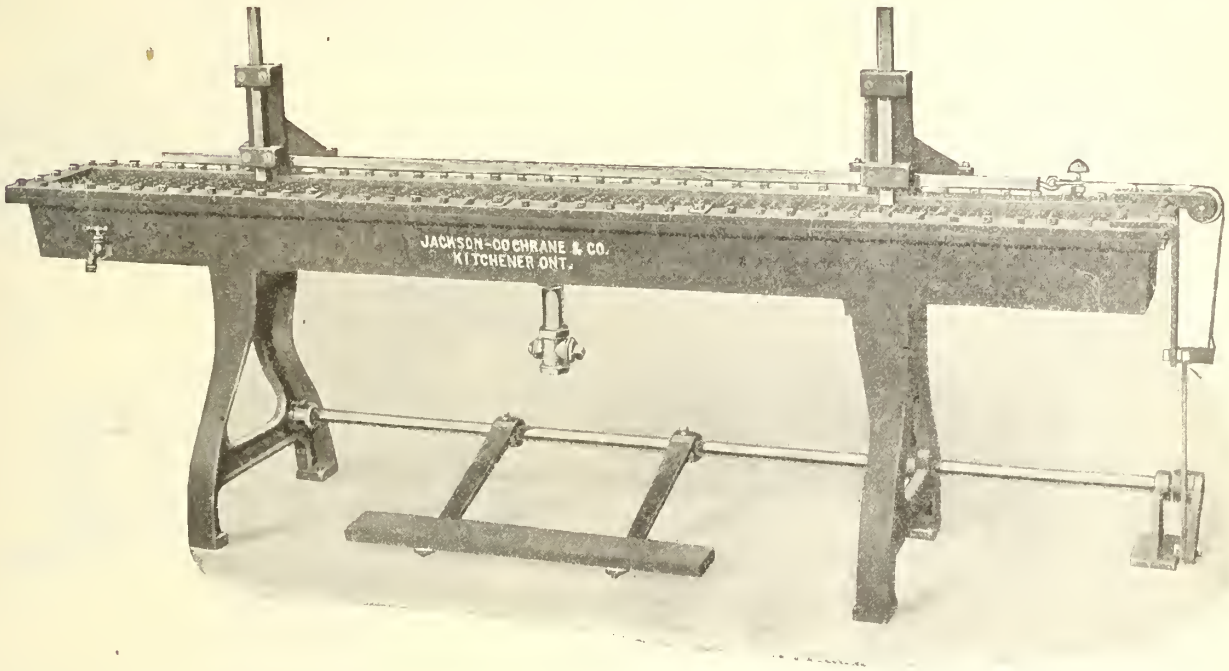
"ST JOE"

Get the name fixed in your mind.

ST. JOSEPH IRON WORKS, St. Joseph, Michigan

A NEW PLATE JOINT GLUE SPREADER



YOU CAN DOUBLE THE PRODUCTION OF YOUR GLUE CLAMPS WITH THIS NEW MACHINE

A thoroughly tested and tried machine that operates easily without waste or mess. It will more than double the production of your clamping equipment. This was proven when it was recently given a thorough trial in one of the largest furniture factories in the Dominion.

The method of operation is simple. The operator presses the foot lever down, forcing the perforated plate up out of the glue. Then by resting the edges of the stock on the plate and moving them backward or forward about one inch, the edges resting on the plate will be instantly and completely spread with glue. On releasing the foot lever the plate is lowered into the glue ready for the next batch of stock.

The tank is 5″ wide and 5″ deep.
Perforated plate is 4″ wide, $\frac{3}{8}$″ thick and 1″ shorter than tank.

Size	Floor Space	Weight
5′ 11″	7′x2′	700
7′ 11″	9′x2′	800

Descriptive Circular sent on request

JACKSON, COCHRANE & CO., KITCHENER, ONT.

Does the work better, in one-third the Time

Here is what the largest manufacturer of kitchen cabinets says of Reynolds Automatic Magazine Fed Screw Driving Machines: "Used Reynolds five years. Given excellent satisfaction. Saves original cost many times over."

And the largest suction sweeper company in the world writes.—"Our two Reynolds not only save us from six to eight men, but in addition do better work than we could expect to have done by hand."

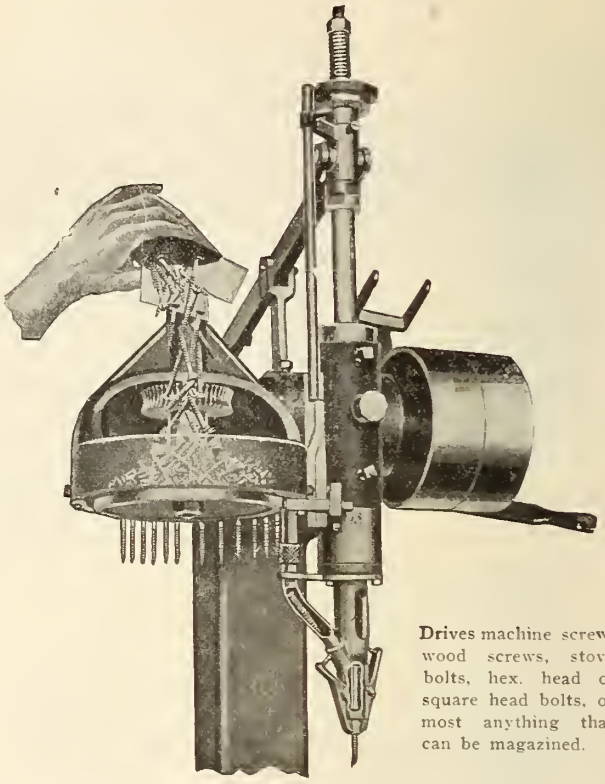
Since writing the above, both these companies have purchased additional machines.
Could you want any stronger evidence of the efficiency of the Reynolds?

Send us dimensions over all of your work and gauge and length of screws driven so that we can determine the proper size and type machine to meet your requirements.

The Reynolds Machine Co.

Department C.

Massillon, Ohio, U.S.A.



Drives machine screws wood screws, stove bolts, hex. head or square head bolts, or most anything that can be magazined.

The Handiest Machine on the Market

The Split-tilting table (Patent Applied For) can be tilted and locked at any angle up to forty-five degrees as indicated on the graduated segment. This machine is also supplied with a solid table. The Boring Attachment is very complete in itself. A foot lever is connected with the table which slides back and forth on the knee. A large coil spring located in the column of the machine automatically releases the work from the bit when pressure is removed from the foot lever. The Boring Attachment is raised or lowered by means of a handwheel connected with a pair of mitre gears. The spindle is bored to take standard size bits and can be arranged for a hollow chisel mortiser. Special cutters may be used by removing the throat in the table. Each machine is furnished with one ten inch saw, belt and wrench.

Write for prices and phamphlet describing this time and labor saver more fully.

D. McKenzie Machinery Co.

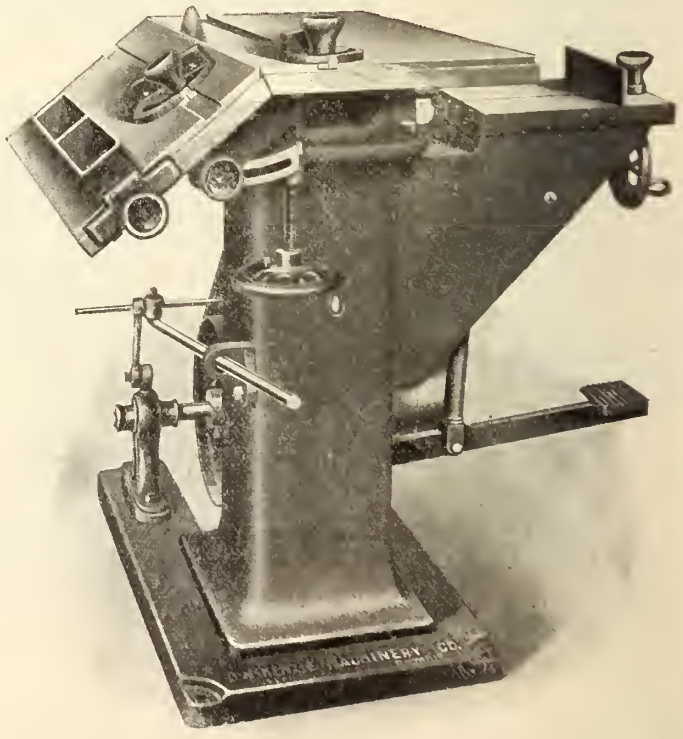
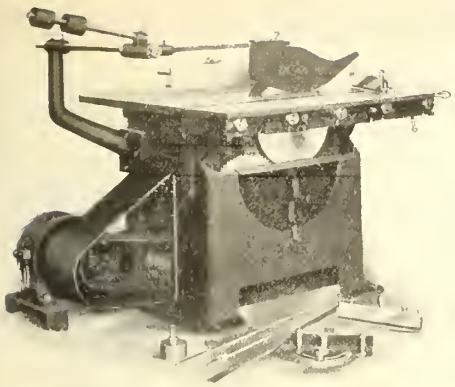
GUELPH, ONT. CANADA



Cross-cut Mitre & Rip Saw Machine showing Split-Tilting Table & Boring Attachment



"Oliver No. 60 Universal Saw Bench"

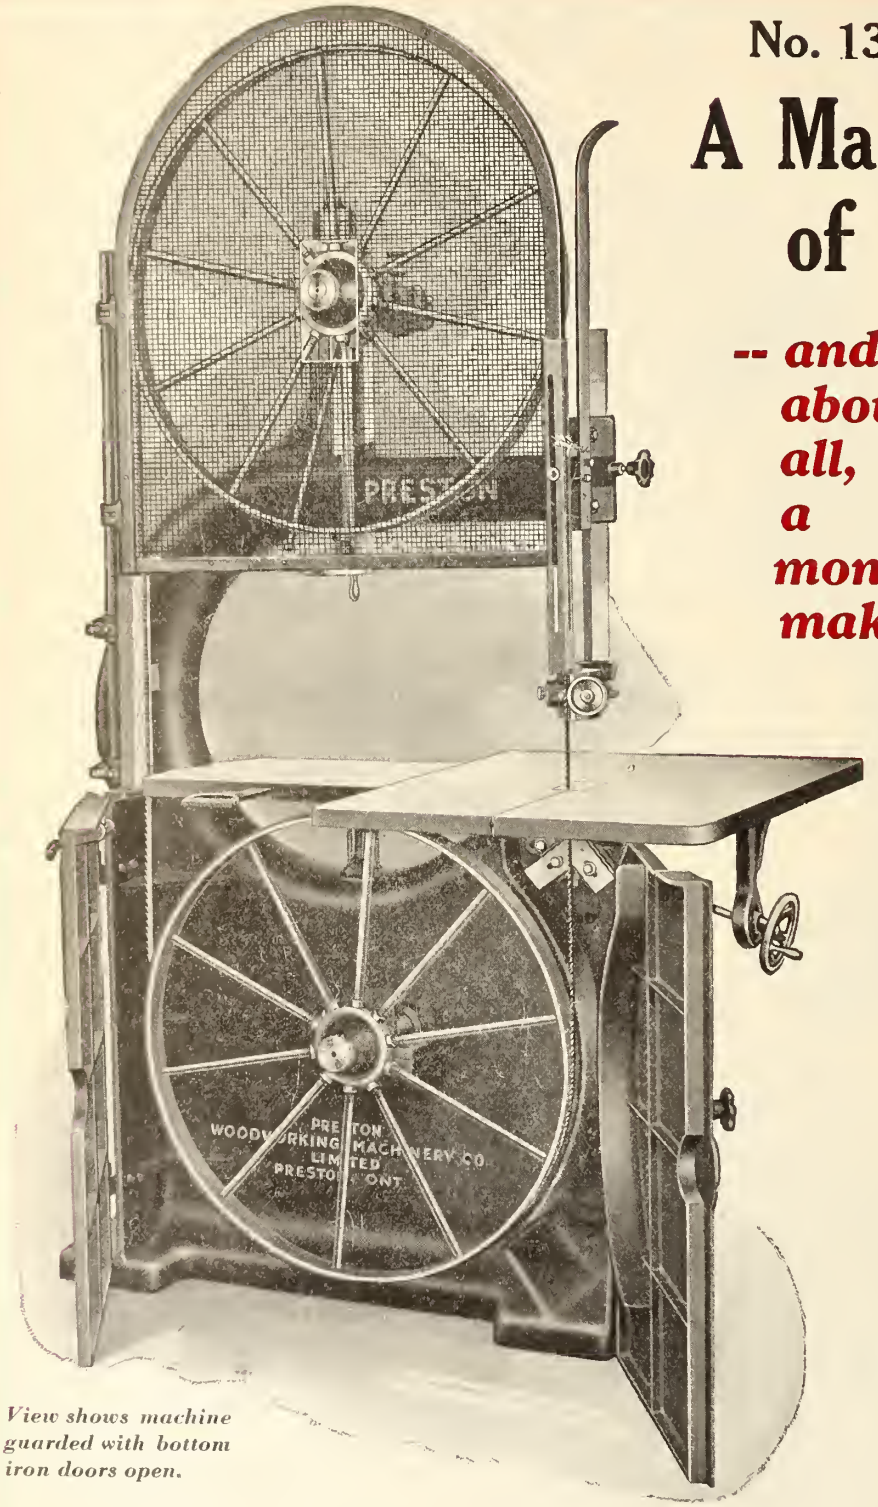
"Oliver" Universal Saw Benches

with their two arbors, one carrying a rip saw, the other a cut off saw have been exceedingly popular tools for many years. They have now been developed to a very high state of effeciency and safety. If you are not already familiar with these saw benches better send for full description.

The name "Oliver" is associated with the word "Quality" in connection with—

WOOD WORKING MACHINERY

The Oliver Machinery Co. is jealous of its reputation in this regard and is careful to build tools that match up to their claims of superiority.



View shows machine guarded with bottom iron doors open.

No. 132—36″ Band Saw

A Machine Worthy of Your Plant

-- and above all, a money maker

If this machine had been constructed to your own specifications we believe you could not be better pleased. Nothing is lacking either in design, materials or workmanship. It is the best machine money and brains can produce.

A few of the special features we might mention are the construction of the wheels (all steel with solid rubber bands 1/4 in. thick), the one piece frame, convenient adjustment, universal alignment of wheels and steadiness in running and the almost perfect tension device and style of guide. This last feature reduces the breaking of saws to the minimum. S. K. F. Ball bearings in upper and lower wheels if desired.

It will be a pleasure to forward details

The Preston Woodworking

Specialists in Ball Bearing Woodworking Machinery

We are the Sole Manufacturers and Agents in Canada of the Eaglesfield Patented Beltless Swing Saw—See advertisement page 17

Power Feed Rip Saw

"Preston" No. 129

In this machine it is interesting to note that the frame is one solid casting, that each bearing is self-oiling, that both table and upper works are adjusted by hand wheels and that the feed is variable from 0 to 240 feet per minute and reversible. In fact, an inspection of this machine from end to end would reveal the unusually careful attention to detail which characterizes every "Preston" machine.

As a labor saving and production increasing device it is not exceeded by any other make, particularly when built with Ball Bearings as we make them now.

First Class Machines For Sale

Practically new type 2-G Yates Straight Edge Rip Saw, with a 10" saw, revolving bed.
Used McGregor Gourlay QY 15 x 6 Planer and Matcher. Thoroughly overhauled.
Practically New No. 112 Fay and Egan "Lightning" Flooring Planer, planes and matches 6" wide, 4" thick, 8 feed rolls. 40 HP required to operate.
New No. 162 Preston High Speed Ballbearing Shaper speed 7,000 revolutions per minute. Table 58 x 41, spindles 1-¼", 28" centres.
Used 24 x 6 Cowan Planer and Matcher, like Cowan No. 11, but the gears are not guarded.
Used No. 4½ 30" American Sectional Roll Cabinet Planer, a very fine surfacer, for cabinet work, in hard or soft woods,with sectional feed rolls and sectional chipbreaker.
Used Wysong and Miles type Belt Sander. In first-class condition.
New No. 143 Preston 10" moulder on base, fitted with slip on heads, variable feed. Latest design embodying all known improvements.
Used 42" Berlin Royal "Invincible" 3 drum Sander, with power raising rolls and spiral drums, with solid bed.
Used 48" Berlin "Invincible" three drum Sander, with spiral drums and hand power raising rolls.
Practically new 20" Preston Jointer, with round safety cylinders.
New 12" Preston Jointer with round safety cylinder.
New C.M.C. 12" Buzz Planer with round cylinder.
Used No. 177 30" Berlin Double Surfacer with divided rolls.
Used 26 x 10 McGregor Gourlay Double Surfacer, similar to C.M.C. No. 216.
New No. 10 Ober Lathe, for making, fork, hoe, broom, ice hook, tent poles, rods, etc.

The Prices are Right.

DEPENDABILITY

Plus

RELIABILITY

Many a woodworker has been using

National Dry Kilns

for years

He could not be induced to change, because he has learned of their dependability. Week in and week out he has found that he can

Depend upon Nationals

to produce quality results

You can name any good qualities that any dry kilns have, and he will show you that these are also to be found in Nationals; and when you are through, he can mention additional features to be found **only in Nationals.**

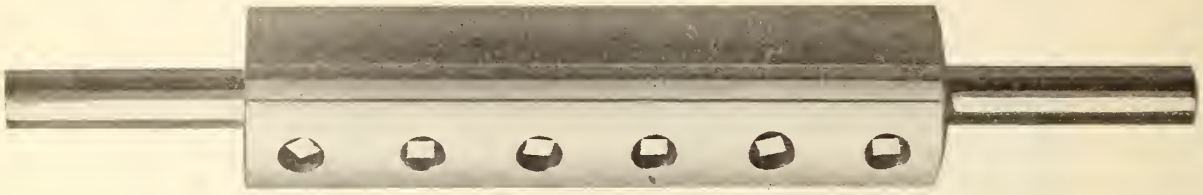
"The First Kiln in 6,000 years in which Humidity is Automatically Controlled"

THE NATIONAL DRY KILN COMPANY, 1117 East Maryland Street, Indianapolis, Indiana

C. A. FIELDS, Canadian Representative, P. O. Box 55, Toronto

NATIONAL DRY KILNS

The ShimerRound Safety Cylinder with High Speed Knives



A Round Safety Cylinder that will Appeal to the Buyer and the User for three Reasons:

The first is our adjusting nut for setting the knives. It is the only cylinder with properly located adjusting nuts for setting the knives, which, with our way, can be set to 1-1000 of an inch.

The second is our way of holding the knife without tapping into the head.

The third is the correct angle of cut for the knives.

Made for Any of the Different Makers' Machines and in Any Length Cylinder.

Vancouver, B.C.

He Does His Best But

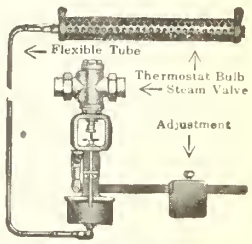
A man's eye watching the thermometer. A man's hand turning the valves. He does his absolute best, but you know that his results are not uniformly right—because at some point there was too much or too little heat.

Automatic Heat Control Stops That

At best, a man can only use his judgment of temperature, which varies from one minute to the next.

Powers Automatic Heat Regulators

Eliminate the guess work by applying the Powers Automatic Heat Regulators. They are scientifically coustructed; made to operate according to certain known physical laws. We manufacture a great variety of types suited to practically any heat regulation condition.



The Powers Regulator No. 15

Entirely self-contained, requiring no air or water pressure for operation. Prevents checking and case hardening in the kiln. Invaluable in the varnish drying room. Other types for other places.

Consult us at once. Our long experience enables us to give you definite information and intelligent advice.

A Quality Shoe on a Thoroughbred —Always

You cannot readily imagine anything but a first-rate shoe on the hoof of the pure blood Arabian steed.

Likewise high grade furniture leaving factories and retail shops daily should be equipped with nothing less than the best in casters.

Efemco Casters are thoroughly in keeping with the finest in furniture—both in appearance and in wearing qualities.

ESTABLISHED 1871

WE ARE TELLING THE PUBLIC: "BE SURE YOUR WALNUT IS REAL WALNUT."

AMERICAN WALNUT

"The Cabinet-wood Superlative."

WE ARE TELLING THE PUBLIC: "BE SURE YOUR WALNUT IS REAL WALNUT."

The "American Walnut Period."

Are You Duly Capitalizing It?

The fact that American Walnut is so firmly established in its supremacy as "The Cabinet-wood Superlative," is of great significance to alert manufacturers. The "up-and-comers" are making preparations to cash in on the "trend of the times," in growing measure. They must do so to keep pace with the sweep of American Walnut into universal public favor.

Of course, you are among this "lucky" number?

Due to American Walnut's superior characteristics the home-loving public now thinks in terms of Walnut. The steady and healthy demand for American Walnut furniture proves the truth of this assertion.

Our Walnut Brochure, de luxe, is filled with ideas and suggestions of interest and value to the trade. A request will bring it, with our compliments.

MAHOGANY

Rarely are such stores of precious wood to be found as may be seen in our yards. Across the seas from tropic lands it comes. From thick jungles where the light of day but dimly penetrates and where tangled native paths make difficult the bringing out of timber. Here the black man labors, risking life from jungle dangers, that supplies will not diminish and your orders may be filled.

Twelve million feet per year is the capacity of OTIS mills. An adequate supply is always on hand for prompt shipment. Get our prices.

THE buyer of hardwoods has a right to insist that he receive his shipment when promised, that he get the grades specified and the full amount called for in his order. The assurance that this will always be true depends upon the reliability of the concern he patronizes.

The reputation of our company for 35 years, and the assurance that we will be in business for many years to come, is a guarantee to our customers that their orders will be faithfully executed to the full quantity and on the exact terms specified.

In a rising market it is doubly important to consider reliability when placing orders

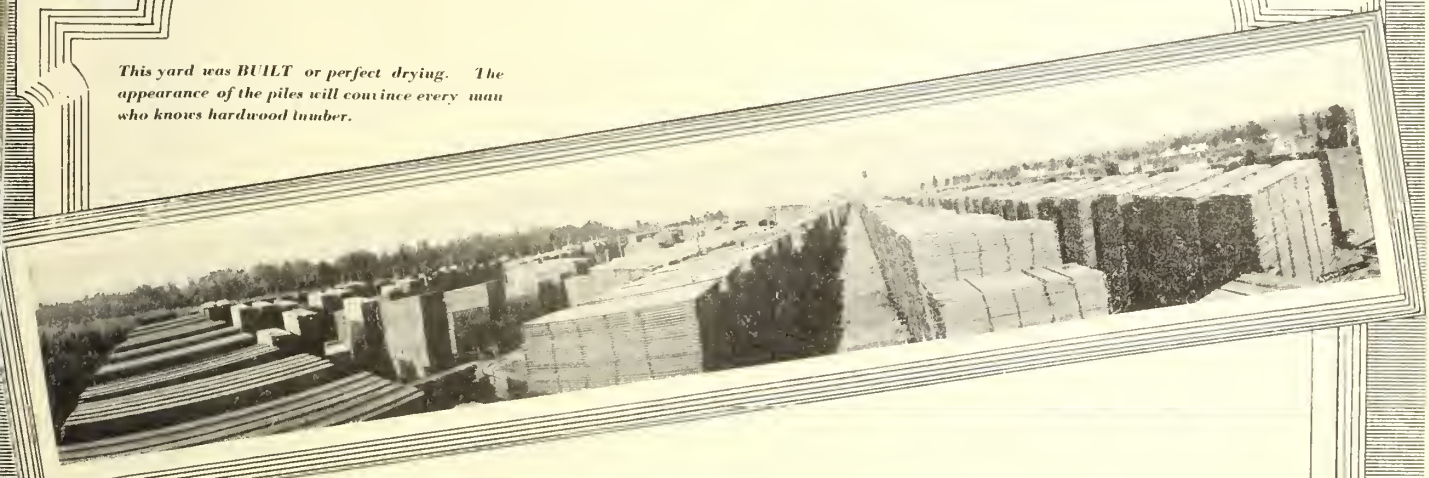
WIS



This yard was BUILT or perfect drying. The appearance of the piles will convince every man who knows hardwood lumber.

Lumber Can't Be ALWAYS Good Without Perfect Piling

The *correct* drying of hardwood lumber is a science based on definite formulae. Recognizing this, our yard was *built* to insure the most perfect possible drying.

Everyone familiar with lumber will recognize what the appearance of the piles in the accompanying photograph means. They are your guarantee of flat, straight, clean lumber.

Our list includes the standard species and grades of southern hardwoods with NOTHING PICKED OUT, and has behind it a comprehensive and conscientious desire to give the customer his full measure of value and service,

Vol. 22 Toronto, January, 1922 No. 1

Good Market for Wood Products

Whether or not activity in the construction industry is the key to prosperity in the woodworking field, it is a fact that when builders and contractors are busy, the woodworking industry prospers in proportion. That being the case, sash and door men, furniture manufacturers and others interested in the wood-using trade, have every reason to view 1922 with no small degree of optimism. An analysis of a report recently issued by MacLean Building Reports, Limited, Toronto, would seem to indicate that the year upon which we have just entered, gives promise of being a good one for the woodworking industry.

According to the figures contained in this report, the value of construction awarded during 1921 was $240,133,300 as compared with $255,605,500 for 1920, and $190,028,300 in 1919. Judging from these totals, it would appear as if the building industry had suffered a slight set-back during the past year. However, when one considers that construction costs have eased off nearly 20% and also that the purchasing power of the dollar has increased, the conclusion reached is that the volume of work undertaken during 1921 was considerably in excess of that entered upon during 1920, in spite of the fact that the value of the contracts awarded was not so great.

A closer study of this report reveals some interesting facts. The value of residential contracts awarded was $76,655,400 in 1921, as against $54,891,100 in 1920, a gain of nearly $22,000,000. Business building is given as $84,721,700 for 1921, in comparison with $86,073,200 for 1920. In the industrial field there has been a marked falling off, the figures being $16,503,700 for 1921, as against $64,625,900 for 1920. What consolation do we find here? Simply this, that while industrial work, which is largely concrete, brick and steel, has fallen off, business buildings, which include stores and office structures, together with residential work, particularly the latter, show a marked increase. Woodwork of all kinds enters largely into the construction and finishing of these two classes of buildings. As long as these special fields show marked activity, the woodworking industry will experience a good demand for its products. The increase in the construction of houses means an enlarged market for furniture, pianos, phonographs and many other articles of wood.

The year 1921 might well be called a "house-building year." More houses were erected in that period than in any other year on record, 16,000 having been constructed. One wonders how near this comes to filling the demand. In Canada, 110,000 couples were married last year and 117,000 immigrants landed on our shores, yet only 16,000 new homes were put up. Not enough to take care of those who were married without considering the 117,000 immigrants. It is estimated that we are still short somewhere in the neighborhood of 165,000 residences.

These figures indicate the trend of development in the building field, a development which augurs well for woodworkers. There does not seem to be any reason why 1922 should not show even greater activity in the residential and business construction branches of the building industry. A demand for these classes undoubtedly exists. The year 1921 ended strong and the momentum gained in the closing months cannot help but mean renewed building activity as soon as weather conditions permit. In November the total value of contracts let was $16,639,000, while during December the figures jumped to $19,118,500, a gain of practically $2,500,000. It might be said in passing that this is the second largest December total on record, being exceeded only by December1912. Construction costs are well down from the high peak of 1920, money is easier, conditions in the bond and investment fields warrant the assumption that more money will be available for mortgages and construction work. Sizing up the whole situation, there does not appear to be any reason why building should not be conducted on an increasing scale during 1922 with a corresponding degree of prosperity for the woodworking industry.

$10,000,000 Worth of Hardwoods

The woodworking industry of Canada is practically entirely dependent upon American manufacturers of hardwood lumber for such as oak, walnut, gum, mahogany, chestnut, etc. According to the figures issued by the Dominion Bureau of Statistics at Ottawa, covering the fiscal year ending March 31st 1921, the value of such hardwood lumber imported during that year was in excess of $10,000,000. For the greater part of this period the woodworking industry was faced with a greatly curtailed demand for its products with the result that the quantity of lumber purchased was well below what it would have been under ordinary conditions. During a normal year when furniture and other articles of wood are moving freely, the purchase of hardwoods would be far greater than shown in this report.

Some of the items were tabulated and classified and are as follows:-

Red Cedar, satinwood and Ebony	$ 44,420
Cherry Chestnut, Hickory and Whitewood	1,136,901
Gum	1,007,697
Mahogany	518,325
Oak	1,506,207
Redwood	18,750
Walnut	287,060
White Ash	118,718
Whitewood and Yellow Poplar	558,562
Veneers of Oak, Rosewood, not over 3/32	649,845
" in other woods, not over 3/32	261,837

Prosperity is Coming

Let's Go Out and Meet It

Review of building industry for 1921, Giving trend of development and probable activit for 1922

By A. R. Whittemore*

The construction industry in the principal countries of the world is, with the exception of agriculture, greater than any other industry, when the yearly volume, expressed in money, is taken into consideration, and it is the greatest of all when expressed in terms of labor employment. It is computed that for the successful operation and carrying on of structural activities there are required the products of over 3,000 industries. It is estimated that this industry in Canada represents a value of $7,700,000,000 or 27 per cent of the national wealth. Fully 1,100,000 persons, either as workers or as members of workers' families, are estimated as deriving their living from this field, either directly or through manufacturing and mining products used in the construction industry.

This is a growing country; it requires in connection with that normal growth a correspondingly normal growth of building. If we go back to the year 1910 and trace the increase up to 1914, this normal increase is quite clearly defined. The line marked XY on the chart, graphically illustrates this point. This chart is developed by using the monthly averages and their increases up to the war, and theoretically continuing the increae up to the present. Since the growth of the country has continued fairly consistently year by year, such a chart cannot be said to be unreasonable or to distort the situation to any extent.

Volume Based on 1913 Costs

This chart shows a very great falling off in building of all kinds during the war—a greater falling off in actual volume of work than is indicated by the money totals of work let—because, as we know, the costs of building increased over that period quite substantially. The black line on the chart shows the value of construction contracts awarded, based on 1913 construction costs, with subsequent price inflation eliminated. These figures cover the small and rural districts as well as the large cities. In order to arrive at this curve, 1913 was taken as a normal base. In 1914 and 1915 costs dropped, and then in 1916 and 1917 the cost began to rise, as compared with the volume, until 1920, when the actual cost of construction work was 165 per cent more than what it would have cost at 1913 prices.

The dotted line on the chart shows the total value of construction contracts awarded in Canada during the past eleven years with their values placed at the current costs of the respective years.

Volume of Depressed Building in Canada

The shaded area on the chart between the estimated normal increase straight line and the black line indicating volume of quantity, gives a fair idea of the shortage of construction work in Canada and is the strongest possible way of indicating the real situation. The difference between the normal requirements of the country up to date and the buildings of all kinds provided shows a great cumulative volume of work unquestionably held back and actually required to bring the situation to normal. What we beleive to be a fair estimate of what this means to the industry (and we think that, while it may be based on more or less theoretical conditions, it is nevertheless reasonable) is that this country is short of buildings and public works at the present day, including dwellings and works of all kinds, amounting to the staggering total of one and one quarter billion dollars. If this represents the demand for building in Canada, it promises great activity in this industry, with resulting advantages to the whole country. No industry that we know of is as well fortified by a large reserve of deferred

* Address delivered at luncheon tendered the Canadian Lumbermen's Association in Toronto.

work that must be taken in hand sooner or later.

At the meeting of the Associated General Contractors of America, held in Washington last September, the statement was made that building is the key to employment. It was shown that for every 200 people employed in construction 500 to 700 are set to work in basic industries, such as lumber, cement, manufacturing, mining, transportation, etc.

Review of Building in 1921

Contracts awarded for construction in Canada in 1921 fell but little short of the previous year in value. The total amount for the year was $240,133,300 against $255,605,500 in 1920, $190,028,300 in 1919 and $99,842,100 in 1918. The most sweeping changes for the year took place in the increase in residential building and public works construction, and the decrease in the industrial as compared with the previous year. Residential building amounted to $76,655,400 against $54,891,100 in 1920. Business building was practically unchanged and constituted the largest group at $84,721,700 against $86,073,200. Industrial was $16,503,700 compared with $64,625,900. Public works construction was $62,252,500 against $50,015,300. During 1921 contracts were awarded for 16,283 residences, 3,224 business buildings, 241 industrial buildings and 1,136 public works.

Returns for December were $19,118,500, being the second largest December total on record, being exceeded only once and that in the boom time of December 1912 with a total of $31,125,528.

Largest Housebuilding Year on Record

1921 was the largest housebuilding year on record in Canada. However, despite this, a very real shortage still exists. Last year, for instance, 16,000 houses were built, but 110,000 couples were married. There were 117,000 immigrants who would require at least 20,000 homes. Add to this the additional thousands who are doubled up with friends or relatives, and it is easy to see why Canada requires at least 165,000 more homes.

The significance of these facts is comprehended when we realize that as soon as the wheels of industry are turning again, and the factories already built are working at normal capacity, there will be a shortage of homes far greater than Canada has ever known before. The small moderate-price dwelling is decidedly in the ascendancy.

Will Not Return to 1913 Levels

We hear a great deal of loose talk about lumber costs. Some people imagine that prices will return to the levels of a decade ago. It is our opinion that this can never come to pass. On what grounds do we base this statement? Simply by taking cognizance of what has happened in the United States and what is happening in Canada.

The index number of 14 lines of lumber compiled by the Department of Labor indicate that present prices are 80.3 per cent more than in 1913. The peak was reached in May 1920, when prices were 195.8 per cent over 1913 levels. Present costs are 38.9 per cent less than peak prices.

Comparative wholesale prices obtained last week show some remarkable reductions as compared with the high prices of 1920. On 7 lines of hemlock the peak price was 122 per cent over 1914, but is now only 45 per cent. 14 lines of pine showed a high price 171 per cent over 1914 but are now 119 per cent. 4 lines of spruce were 135 per cent over 1913 but have now declined to 13 per cent over 1913.

Current prices of certain lumber commodities bring forward the fact that to-day's producing cost and selling prices are so close together as to retard production. The present situation is such that the small margin of profit in production of some of these articles has so reduced output that should purchasing be increased to any extent, the shortages developing would be apt to produce again the dangerous runaway market. Such a condition would be most undesirable.

(Continued on page 98)

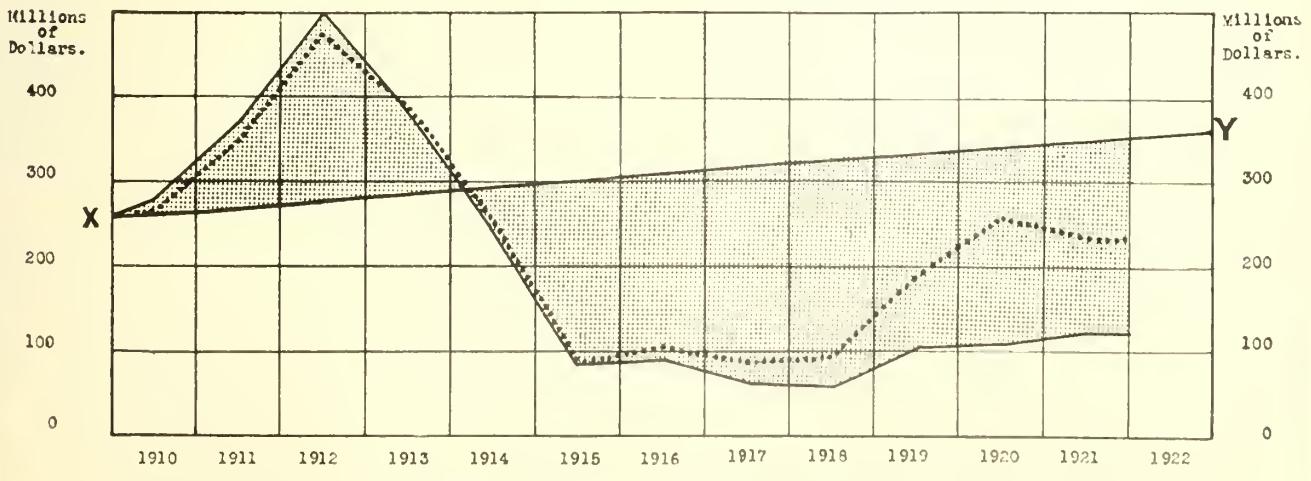

Chart Showing How Actual Construction Dropped Below Normal Requirements

Sidelights on Furniture Exhibitions

Attendance at Stratford, Kitchener and Toronto up to Expectations—Satisfactory Volume of Business Placed—Trend of Design and Finish

The eyes of the furniture industry are focused, at the present moment, on exhibitions which are being held at Toronto, Kitchener and Stratford. To many, these displays are a barometer by which the prospects for the next six months or year may be judged. What satisfaction or cause for hope is to be found in the results attending the first ten days of these exhibitions?

The writer has just returned from a visit to the different markets. Sizing up the shows in the light of information received and opinions expressed, it would appear as if on the whole they are very satisfactory. A gratifying number of buyers have made the rounds, and while the orders placed may not have been as large or as numerous as many manufacturers were expecting, yet there has been a very satisfactory turnover. Better still, the visiting dealers were, on the whole, very optimistic. This probably is the most hopeful feature.

Do Dealers Come to Buy?

The furniture dealers of Canada do not seem to have accepted the idea, as have many American retailers, of attending the markets with the attention of restocking their floors and placing orders for future delivery. Their attitude is rather that they want to see the new designs and finishes, gain an idea of prices, perhaps buy a few sample pieces and then when the travellers call, they are in a position to talk business. For this reason and because many retailers promised orders when the travellers called, it was felt in some quarters that the real results of these shows will be forthcoming when the various representatives make their rounds of the trade.

It was rather difficult to gain a clear conception of the extent to which the dealers were buying. Some manufacturers were enthusiastic over the volume of business they had secured, while others were decidedly disappointed. In one way it it difficult to account for this uneven distribution of orders. Practically all furniture makers were out with new designs, new finishes and had figured cost as low as was consistent with present replacement values, yet some seem to have brought out designs which took the eye of the buyer, while others were not so fortunate. The law of compensation or the law of averages seemed to hold good, for while certain manufacturers claimed that the volume of orders placed with them was greatly in excess of those received in January 1921, more than double in some cases. Others, who enjoyed a good business at 1921 market, were hardly doing anything.

Medium Grade Lines in Demand

The demand tended toward the medium grade lines. Not that the higher class furniture was a drug on the market for many nice orders were placed for quality stock, but there was a feeling on the part of the retailers that it was going to be easier to sell medium-grade lines than high-grade furniture. Another feature was that freak designs and freak finishes were not bought up like hot cakes. In this respect, at least, our Canadian retailers are inclined to be conservative.

As estimated previously, all the furniture makers were showing new designs. Many outdid themselves in an effort to produce the best possible, and in this their efforts were successful. There was a lot of extremely attractive furniture to be found, furniture that for design, quality and workmanship compares favorably with anything produced on this continent. The trend of these new designs is not very clear. Each manufacturer seemed to follow his own ideas, though there was a tendency to get away from what might be termed true period designs, if any of the furniture placed on the market in recent years could be termed true period.

Walnut seemed to be the most popular wood, though oak in the quieter, more attractive finishes, is coming back strong. Mahogany and gum were not so much in evidence. If some of the newer finishes could be applied to figured red gum without losing the variety and beauty of its grain, furniture made of this wood should find a ready demand.

All the newer finishes were to be found, decorated enamel, two-tone enamel, polychrome, duo-tone walnut, oak and mahogany and dusty walnut and oak. The trend of finishes as indicated by the Grand Rapids and Chicago markets, is toward duo-tone and lacquer finishes. While duo-tone was noticeable in nearly every display, it was not the predominating finish, while only a few manufacturers were showing pieces in lacquer.

New Developments in Upholstering Field

Some wonderful creations were found in the displays made by the manufacturers of upholstered furniture. It is futile to attempt to describe the attractiveness and comfort-giving qualities of some of these pieces. As usual, the luxurious chesterfields predominated. On the better lines, the spring cushions have been replaced by soft down-filled cushions and pillows. (A series of articles on down-upholstering has been running in the "Canadian Woodworker" for some months.) Another departure noted was in the lines and contour of these pieces. An attempt has been made to get away from the heavy massive appearance which characterizes this class of furniture and by reducing the roll of the arm, sometimes using down pillows instead of spring arm and back, and in other ways giving it an appearance of lightness so that it will fit in better in the average sized room. The duo-tone has made its appearance in connection with upholstered furniture and many attractive color combinations were to be found.

Sizing up the whole market, the furniture displayed was a credit to Canadian enterprise, and while some manufacturers may not be any too well satisfied with the total of orders booked, yet on the whole the total volume of business placed seems to have come up to general expectations. This coupled with the attitude and optimism shown by the dealers argue well for 1922.

K. J. Shirton, retail lumber dealer, Dunnville, Ont., has been re-elected mayor for the coming year.

Furniture Manufacturers to Train Apprentices

Have Their Eye on Possible Shortage of Skilled Furniture Workers—Scheme Being Prepared to Give Special Training to Beginners—Plans Call for Three Year Course

It has been stated time and time again that in the not far distant future the Canadian woodworking industry will be confronted with a serious shortage of skilled mechanics. The younger generation, from which our supply of mechanics for the future must be recruited, seems to have felt the lure of other industries in which the opportunities for immediate gain are greater, and as a result the number of boys and young men who are entering our woodworking factories with the intention of learning the trade, is small.

To counteract this condition and to place the furniture industry in a more favorable light in the eyes of the young men of to-day, the furniture manufacturers of Canada, working through the Furniture Manufacturers' Association, have outlined an apprenticeship course of specialized training which they hope will be the means of inducing a larger number of boys to take up furniture work. The plans call for a three-year course to be given in the different factories and which will tie up with the work going through.

Cabinet-making to Receive First Attention

A start is to be made in the cabinet-making department. A special committee, composed largely of superintendents, men who have had years of practical factory experience, is working out the details of what is to be known as the "Cabinet-making Apprentice Training Course." This course will be open to any employee. Instruction is to be given through a series of pamphlets each dealing with some one phase of cabinet work. These instruction sheets will embrace all the fundamentals of the trade without being too exhaustive. The pupils will be taken step by step through all phases of cabinet work and in all probability in their third year will receive instruction in draughting and designing. The first few lessons will cover tools and their uses.

The course is to be open to boys over sixteen years who, after serving a brief trial period during which they will be paid, will be called on to sign up for the full course. Every effort will be made to make the work attractive and remunerative to those undertaking the studies, and special inducements are to be offered to all who complete the full course of instruction. During the first year the scale of pay under consideration ranges from 12 to 17½ cents per hour. Part of the plan is to see that skilled cabinet-makers in each plant, those who have the ability to give instructions, are selected to supervise and assist the students.

Appeal to Ambitious Boys

It is hoped that this course of training will be the means of attracting a class of young men from whom will spring the foremen and superintendents of the future. It may be that there is splendid material at present in the factories which only needs developing. If so, it will not be overlooked. This offers an excellent opening to ambitious young men who are desirous of fitting themselves for higher positions.

Later on the course of instruction may be enlarged to embrace other departments and perhaps through time will cover every phase of furniture manufacturing from the handling of the raw material to the packing and crating of the finished product. Men trained in this way will have a better grasp of the fundamentals and details of their trade, than if they had just picked it up in a haphazard manner.

Furniture Industry and Lumber Situation

The furniture industry is the largest consumer of hardwood lumber, and in making its purchases has gone to extremes, either buying far in excess of its actual requirements, or going out of the market entirely. Unquestionably the furniture manufacturers bought more lumber than they needed during the first part of 1920, and this demand coming at a time when the production of lumber was at low ebb because of weather conditions forced prices up to an abnormal and unhealthy basis. This was followed by the other extreme; the furniture manufacturers for a long period bought practicallly nothing, which resulted in prices being forced to a basis far below the cost of production, and compelled the shutting down of mills, and the reduction of production to a basis that was not consistent with potential needs.

It has been suggested that the furniture industry has recently embarked upon a campaign of excessive buying, as a decided inclination to buy lumber for requirements far in the future is noted. This is considered ill advised, as the situation is quite similar to that which existed in the early part of 1919. Stocks are comparatively light, there is little chance at this time of the year to increase production, and with any undue demand prices will again advance to an unreasonable level. The interests of both the producer and consumer would be better served by a uniform distribution of this demand. The consuming manufacturer must carry some lumber ahead, but this policy should not be carried to extremes, and lumber should be bought practically as it is needed, and not for speculative purposes.

Furniture Manufacturers' Association's Annual

The annual meeting of the Furniture Manufacturers' Association is scheduled to be held in the Association Board Rooms, Toronto, on Thursday February 2nd, 1922. A number of interesting addresses will be delivered and the election of officers for the ensuing year will take place. This follows a special meeting of superintendents which has been called for February 1st.

Bringing the superintendents of the different plants together in this way is a new departure and it is felt that much good will result. An exchange of ideas among those responsible for the efficiency of the different factories should tend to broaden all who attend. One of the first subjects for discussions is the apprenticeship plan for the training of cabinet makers, which is outlined elsewhere in this issue.

Check Up Your Storm Sash Costs

Have Woodworkers Only Crudest Conception of Costs?—One firm Would Make Large Profit at Figure Another Estimates is Cost.—Where Do You Stand?

The estimates of cost on eleven slab doors published in the December "Canadian Woodworker," have been the cause of considerable comment. It was with a feeling of surprise that many who are following these articles, noticed that there was a difference of over 100 percent between the high and low estimates of cost. If these figures had included varying allowances for profit, this would not be quite so startling, but when it is considered that they represented the ideas (or guesses) of different woodworkers as to the actual cost of these doors, they reveal a lack of cost knowledge that one could hardly believe to be possible in this enlightened age. They also show the need for and value of articles of this type.

One subscriber wrote in saying that he had checked these costs with his own and was satisfied that the actual cost as published was about correct. Another writes that his estimate would have been considerably higher than the real cost as given, but that he cannot see anything wrong with the cost recapitulation as shown. Still others have written commenting favorably on the articles and requesting that the good work be continued.

Not a Semblance of Uniformity

The number of plants properly equipped for the economical production of slab doors is small, and this may be one reason for such a marked difference in the figures submitted. That cannot, by any means, be applied to the manufacture of storm sash, yet according to the cost estimates published herewith, the variation is almost as great. Here is a simple job, 38 storm sash; yet no two woodworkers agree as to their idea of cost.

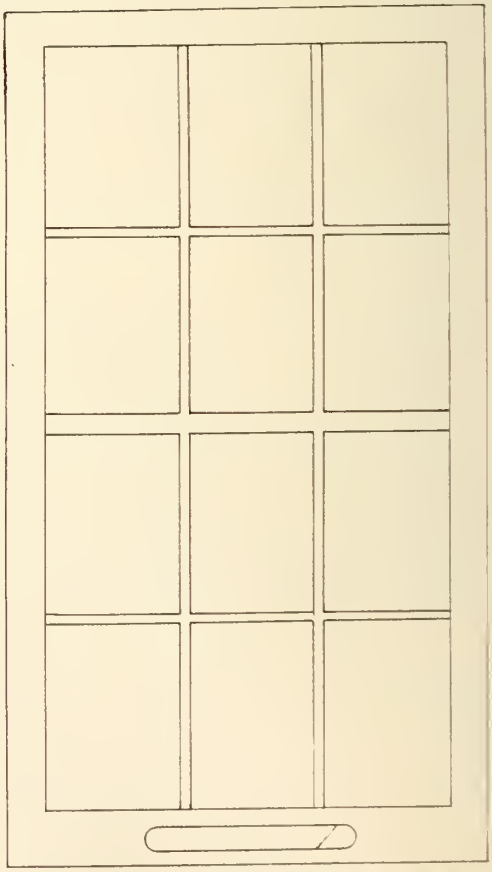
The figures shown this month give more detailed information as they give the estimated amount of material and estimated waste in addition to covering other phases of the work. This additional information only tends to emphasize and accentuate the different ideas as to quantities, time, values and waste, which exist in various plants. It is strange, to say the least, when out of twelve woodworkers who submitted cost estimates, only two agree as to the amount of material required and their survey of 550 feet exceeds by 125 feet the figure given by the firm which did the job.

List of Estimates Submitted

sEstimate	Material	Feet	Waste	Bench	Machine	Priming	Total
1	$59.65	530	25%	52	34	$22.00	$173.70
2	53.35	494	20	19	38	20.00	164.40
3	47.17	510	32	30	28	10.00	157.15
4	39.63	490	10	36	42	13.00	151.65
5	54.00	470	15	25	25	19.00	140.10
6	36.30	550	10	25	41	22.50	131.45
7	37.15	460	20	22	32	12.00	124.75
8	43.70	475	15	18	27	16.50	119.10
9	**41.37**	**426**	**25**	**14**	**21**	**14.50**	**111.02**
10	50.41	550	30	14	19	7.60	108.19
11	33.75	410	20	24	29	9.00	104.20
12	32.20	400	15	17	17	11.50	97.85

What is wrong? A certain amount of judgment may have to be used in fixing the time required to complete a specified piece of work, but the amount of material going into any piece of work can be accurately calculated and should not vary in different plants. What do we find? One woodworker estimates that it would require 550 feet of pine to make the 38 sash in question. Another says 530; a third 510 and then on down the list 490, 460, 425 and400, a variation of 37 percent in material alone. When woodworkers do not agree on such a fundamental as the quantity of material required for a simple piece of work, it is not so difficult to understand why they seldom agree on prices.

The waste column affords an interesting study in itself. Two allow 10 percent, three 15, three 20, two 25, one 30 and one 35. On a job of this kind the waste should not run very high, not over 20 or 25 percent. An allowance of 15 percent is not high enough to cover the actual waste, while 30 and 35 percent allow for too great a leeway. If a person will keep close tab on the material worked up, it will be found that on the general run of work going through a sash, door and general woodworking plant, the waste will average in the neighborhood of 30 percent, but will show a marked variation on the different classes of work. The estimator must display good judgment in fixing the waste allowance. Coming to hours, it would appear as if some of those responsible for these figures have but the haziest notion of the length of time required



Storm sash, 24—2 ft 8 in. x 8 ft 2½ in. x 1⅜ in., 12 light, 11—2 ft. 4 in. x 8 ft. x 2½ in. x 1⅜ in., 12 light; 3—2 ft. 4 in. x 4 ft. 2½in. x 1⅜ in, 6 light. Bottom rail bents, standard bars and rails, primed one coat.

to complete such a simple job. One allows 85 hours for bench and machine work, another 33, a third 34 and a fourth 78. It seems to be of little avail to ask why, for there is no reason for such wide discrepancies. Just wild guessing. This is simple work, sticking, mortising, tenoning and sanding. Nothing complicated, no elaborate machine set-ups, nothing to require a lot of time. If the "Canadian Woodworker" were to venture an opinion, it would be that the smaller time allowances are about correct. Forty-one and forty-two hours mean four days of machine time to prepare and sand this lot of stock. Can't see it.

How Cost Figure is Made Up

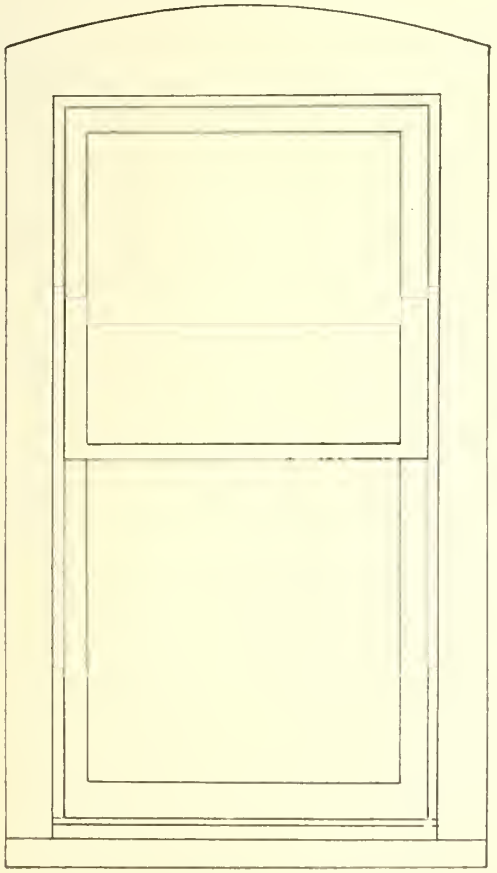
The estimate shown as No. 9 which is the one submitted as an accurate recapitulation of the cost of the storm sash, is made up as follows:—

Material		
426 ft. sash pine @ $75.00	31.95	
38 Bottom Vent Slide .03	1.15	
	33.10	
Add 25% waste	8.27	
		41.37
Labor		
Machine 20.10 hrs. @ $1.20	24.20	
Bench 11.25 " @ .90	10.25	
Helper 3.40 hrs. @ .60	2.20	
		36.65
		14.50
Priming (including paint)		14.50
		92.52
Plus 20% Commercial Burden		18.50
Total cost		111.02

If estimate No. 9, which is the one submitted by the woodworker who did the job, is anywhere near correct, factories 1, 2, 3, 4 and 5 could make a nice profit working at cost, while No's. 11 and 12 would have to add at least 30 percent to come out on the right side of the deal. When such large discrepancies exist on such simple work, it makes one wonder what the differences would be on a really complicated job. Is it any wonder that those in need of woodwork feel inclined to shop around. They usually find someone willing to do the work for about half what the others want.

The February "Canadian Woodworker" will contain a cost study on frames and sash, as shown in the accompanying sketch. The specifications are 13 box frames, brick opening, 3ft.-6in. x 6in.-0, 1¾in. two light sash. These frames are standard, that is 7/8in. pulley stiles, 7/8in. inside and outside casings, 1⅜in. hanging stiles, 2in. x 6in. sills and cambor head. Here is a common every-day job. How does your idea of cost compare with others in the industry? Don't wait to be asked for cost figures but work out your cost estimate giving material, waste, bench and machine hours and commercial burden and send it in. Do it now.

Next Month



Next month estimates of cost will be published on 13 box frames and sash, brick opening, 3 ft. 6in. x 6 ft. 1¾ in. 2 light sash. Send yours in.

Grand Rapids and Chicago Markets

The furniture exhibitions, which were held recently at Grand Rapids and Chicago, brought out a large number of retail buyers; in fact the attendance was all that was expected. Better still, those who visited the shows came prepared to buy and prepared to pay the prices asked.

Last January, it will be remembered, the buyers made a concerted effort to break the market and secure lower prices. In this they were more or less successful. This year they seemed to realize that prices have been reduced as low as is consistent with present costs, and they are giving more attention to design and finish than to the price factor. When they came across a suite or piece of furniture which they thought would appeal to their trade, there was no hesitation about placing an order.

The majority of the manufacturers were showing some new designs, in addition to their standard lines. This new furniture showed a marked departure from the idea of slavishly reproducing period designs. While the various characteristics of period furniture were not lacking, the designs were more individualistic, that is, the designers seemed to have permitted themselves greater latitude in outline and ornamentation.

Walnut seems to have held the centre of attraction, with oak and mahogany close second. Polychrome and enamel finishes were not so numerous as at recent exhibitions, their places being taken by duotones and some of the more popular lacquered finishes. The demand for a Polychrome and for decorated furniture seems to have eased off.

Messrs. Berkey & Gay, of Grand Rapids, showed a rather unusual suite in what they call their "No. 1776." As the year 1776 witnessed the Declaration of Independence, the suite bearing this number was designed to represent the American nation. Each individual piece going to make up the suite, was different in design and detail from the other pieces, yet the whole effect was harmonious and attractive, each piece seeming to blend in with the rest. This represented the fact that America takes the various classes of foreigners which come to her shores and educates and develops them and welds them together into one united and harmonious nation.

The Treatment of Depreciation in Production

Simple Method of Figuring Depreciation—How Calculations are Made and Applied—Method of Keeping Depreciation Account

By E. W. McCullough, Manager, Fabricated Production Department, Chamber of Commerce, Washington

[Concluded from December issue]

Another matter to bear in mind is that your estimate of depreciation rate and the useful life on which it depends are not necessarily final. Things have a way of lasting longer than anticipated, while, on the other hand, unforeseen circumstances bring the usefulness of equipment to an untimely end. When it becomes plain that the life of the property becomes over or under estimated, re-life your property and revise your depreciation rate accordingly.

Intimately connected with the accounting for depreciation is the method of depreciation. Accountants have suggested numerous methods of charging depreciation; sinking fund, declining balance, fractional method-weighted years, etc., each with special advantages and strong points, but for firms who heretofore have had no consistent depreciation policy and wish to adopt one, the fixed percentage or straight line method is suggested. It has been shown that when production is abnormally high or low modification of the straight line method is sometimes necessary but, on the whole, this method is the simplest. The straight line method calls for equal annual depreciation deductions and assumes that the rate of depreciation is uniform during the entire life of the property.

To illustrate the fixed percentage or straight line method of depreciation:

A machine cost $120. Its estimated salvage or scrap value at the end of its usefulness is $20. It has an expected normal useful life of 10 years. Deducting the salvage value from cost, we obtain a remaining sound value of $100. This divided by the expected years of usefulness gives a depreciation of $10. Expressed in terms of a formula:

$$\text{Annual Depreciation} = \frac{\text{(Cost New — Scrap Value)}}{\text{Useful Life}}$$

Should be Adequately Recorded

It is not usual to find assets grouped under such general captions as Buildings, Machinery and Equipment. The term "Buildings" may include wood, concrete, steel or brick structures designed for heavy use or light, may include fencing and wood bins, drainage systems and docks. The term "Machinery" may comprise electrical generators and steam engines, hydraulic presses and steam hammers, lathes, planers and boring and milling machines, woodworking machinery and small tools. The "Equipment may vary from a locomotive train to pickling tanks, from glass furnaces to fire systems. The span of usefulness of these assets may vary from three years to thirty-three, yet all will bear a 3 per cent, 5 per cent or 10 per cent rate of depreciation, nor will it be possible to determine the depreciation record or history or the undepreciated value of any specific unit or type of property.

A classification of property is a prerequisite to the proper record of depreciation. Tax regulations, as well as ordinary accounting property, require that the allowance for depreciation should be computed and charged off with express reference to specific items, units or groups of property, each item or unit being considered separately or specifically included in a group with others to which the same factors apply. Hense a proper record of depreciation requires that the specific items and units of property be enumerated and classified by kind, group or department, and that their original cost be ascertained, as well as the accumulated depreciation and the remaining useful life.

To do this will not be easy for an established concern accustomed to taking depreciation on a general grouping of property, such as Buildings or Machinery, and for such a concern "the splitting up and allocation of the old capital outlay must be approximate." Such allociation will, however, be greatly assisted by a competently made appraisal.

How Facts May be Secured

A complete record and history of depreciation as well as of plant and equipment can be secured through the property ledger, which aims to do for plant and equipment what the perpetual inventory record does for stock on hand.

Such a property ledger will tie up with the general books of account, and will supply the detail for the total cost of property, the depreciation written off in any one year, the additions, renewals and disposition of property, the amount in the depreciation reserves, the estimated scrap value, and the net remaining sound value of property.

In addition, the property ledger will contain a brief description of all property, where located, plant identification, the name of manufacturer and manufacturer's number, from and when purchased, the total cost, including freight and installation charges, the estimated useful life of equipment and rate of depreciation, and it may likewise have a record of repairs, replacement values and a tabulation of monthly depreciation.

The property ledger can be conveniently compiled in card or loose leaf form, and each card or sheet ought to last from twenty to thirty years. Practically the same form can be used for departmental and final summaries of plant and depreciation. The complete financial, plant, and the performance history of each item of property secured in this way guides future outlays upon plant, helps the accurate determination of loss or gain on specific assets, is of some importance in credit applications, simplifies the compiling and checking of tax and annual statements, and is invaluable in the event of a fire loss. The surprising thing is that there is still a comparatively large number of concerns operating without such a property ledger.

How Depreciation is Calculated

The arrangement of the form of property ledger as well as its size, etc., will depend on the ingenuity of the executive or cost accountant designing it, as well as upon his sense of what is important information for his particular requirements, industry or plant. It may be desired to compress all the information on a small card, using both sides, or it may be considered wise to keep track of monthly depreciation, the cost of repairs or replacement values. These are merely details to be adjusted to and by individual needs.

To illustrate the use of the property ledger, it is supposed that a 50 H. P. Steam Engine in purchased from Evans and Clark for use in the Trimming Dep-

artment. S. E.-T. 1799 is its plant number, S. E.—symbol for Steam Engine, T. for Trimming Department. This plant number appears on the name plate of machine where it can be easily seen. If the asset is frequently moved about the plant, it will be given a location number. The manufacturer is the Brighton Engine Co., the manufacturer's number B-93217. Its useful life has been determined at 15 years. The invoice for the engine comes to $2500, freight charges $15, installation $185, a total cost as of January 1, 1921, of $2700. The scrap value is computed at $150, leaving a wearing value of $2550, and an annual depreciation of $170, arrived at by dividing the wearing value by the useful life of 15 years.

The record of the engine is as follows:

1921.—Normal depreciation of $170, no additions, no renewals. At the end of the year there will be $170 in the depreciation reserve and a net remaining value of $2380. (Wearing value $2550 less depreciation reserve $170).

1922.—Normal depreciation of $170, no additions, no renewals. At the end of the year there will be $340 in the depreciation reserve and a net remaining value of $2210.

1923.—Normal depreciation of $170, no renewals, an addition in the way of a lubricator, installed Oct. 8, at a cost of $150. At the end of the year there will be $510 in the depreciation reserve and a remaining value of $2190. (The former wearing value of $2550 has been increased $150 to $2700, by the cost of the lubricator; $2700 less $510 in depreciation reserve, leaves a net wearing value of $2190).

1924.—The normal depreciation has been increased to $182.50. This is arrived at by dividing the new remaining value $2190 by the remaining useful life of 12 years. No additions, no renewals. There is accordingly at the end of the year $692.50 in the depreciation reserve, and a net remaining value of $2007.05.

1925.—Normal depreciation of $182.50. Other things being equal, there would accordingly be $875 in the depreciation reserve at the end of the year, and a net remaining value of $1825, but on July 12 the old piston has been replaced by a new one costing $300. This $300 is charged against the accumulated depreciation, reducing that to $575, and increasing the remaining value by just that much to $2125.

1926.—At January 1, 1926, the asset has been in use five years. Its remaining useful life accordingly would be ten years, but the replaced piston, etc., it is assumed, prolongs the useful life two years, and the remaining useful life of the asset is correspondingly changed to twelve. This remaining useful life, twelve years, divided into the remaining value, $2125, gives a new annual depreciation charge of $177.08. At the close of the year, the depreciation in reserve will amount to $752.08 and the remaining value $1947.92.

1927—On the tenth of January the machine sold for $2000. On the proper page of the journal an entry corresponding to the following will appear:

Cash	$2000	
Reserve for Depreciation	752.08	
Profit and Loss	97.92	
Buildings		$2850

The sales price, $2000, plus the accumulated depreciation, $752.08, $275..08 deducted on the transaction.

A notation can be written in red ink across the face of the property ledger page, or the items of cost, scrap and wearing value, depreciation reserve and remaining value closed out.. At all events, the page will be taken out and filed in the rear of the ledger.

This hypothetical history is given to show how the property ledger operates and by what manner of contingencies it is affected.

A. D. F. Campbell, of A. F. Campbell & Son, woodworkers and retail lumber dealers, Arnprior, Ont., was re-elected by acclamation a member of the council of that town for 1922.

Does Not Sit Down and Wait for Business

Unusual Display Facilities Effected Through End Piling of Finished Material—Find Motor Truck Particularly Desirable—If Business gets Slack Build a few Houses to Keep Things Going

One of what might be termed the progressive type of woodworker is found in the person of D. C. Baird, of St. Mary's, Ont. He has been at the game ever since he was a little shaver, has grown up with it in fact. Shortly after leaving school Mr. Baird entered the plant of Brown & Co., St. Mary's, to learn the trade of bench carpentering. For this he received the munificient sum of $3.00 per week. After working at the trade for a few years, he was taken into partnership, acquiring an interest in the concern. He severed this connection two years later to engage in the manufacture of wood boxes.

The original box industry has been expanded and extended so that now, the business comprises a box factory, a planing mill and a retail lumber yard. The box plant is kept busy manufacturing butter boxes for creameries and butter factories. These boxes are made of spruce, entirely, as it has been found that any other kind of wood tends to taint the contents. Two sizes are made, the 45-pound and the 60-pound size, the specifications being 8″ x 14½″ x 14½″ and 8″ x 14″ x 19″ respectively. For shipping, the boxes are nested, one box being placed on top of another, while inside there is a third standing on end. A nail driven in each side holds the upper and lower ones to the centre box. In this way, considerable space is conserved.

May Change to Electricity

The equipment of the box factory consists of resaw, four-sided planer, cut-off saw, rip saw, disc sander, dovetailing machine and nailing machine. Power is furnished by a 35 H.P. Goldie & McCulloch steam engine. The shavings are conveyed to the boiler room where they are used for fuel. Mr Baird is considering changing to the electric drive.

Off this plant is the carpenter shop where such articles as sash, doors, frames, are assembled and finished. Beneath this is the planing mill where all kinds of woodwork and general custom work is done. Contracts are taken for the complete woodwork for houses, stores, office buildings and other forms of construction work.

Fine Storage Facilities

In connection with the plant is what is considered to be one of the finest dressed lumber storage sheds in Canada.

It is 90 feet square and constructed of sheet metal siding to conform to the building by-laws of the town,

D. C. Baird, St. Mary's, Ont.

and covered with prepared roofing. The building is on a cement foundation, with cement piers running the full length of the sides and also under the flooring

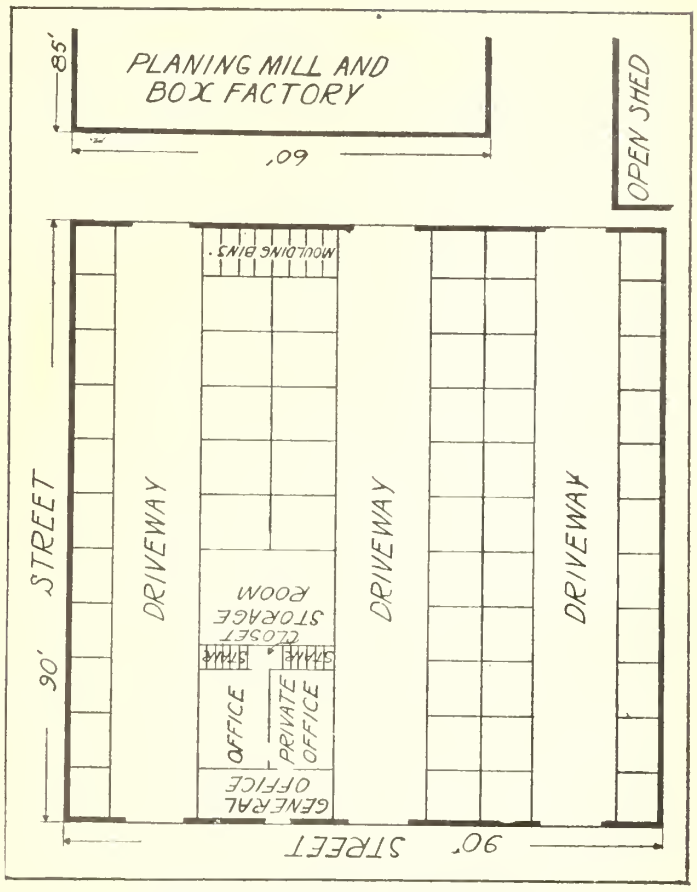
on which the lumber is piled. There are three driveways or lanes each of 13 feet width in the shed, and entrance is gained through large sliding doors. Lumber in all lengths up to 18 feet on the outside and 24 feet in the centre is piled on end in the various stalls, which are eight feet square. Underneath the plank flooring is a 3 foot air space, which is tiledrained and allows free circulation of air.

In the centre at the front of the building is the private office of Mr. Baird, as well as the general office, both of which are panelled and finished in B. C. fir. The interior is attractive and inviting. Just back of the office is a garage for the automobile of the owner, and upstairs is a large stock-room, where are kept the doors, sash, windows frames, newel posts, verandah posts, mouldings and other factory material. The building throughout is electrically-lighted and the office quarters are heated by steam from the exhaust of the planing mill..

Advantages of End Piling

Commenting on end piling, Mr. Baird says it may be to some extent new in Ontario, but it has been followed for a number of years in the West with most satisfactory results. The advantage is that a customer can see the lengths, the knots, the grain or any good or any bad points when buying. He can also see the various grades of lumber, the different kinds, etc., for he has in front of him a complete representation of the stock carried by the dealer. In other words, he can fully examine the goods before purchasing. Lumber is also more easily and economically handled when piled on end, dries more quickly, is displayed to better advantage and requires less labor for loading or unloading.

About six years ago Mr. Baird inaugurated what was then considered a novelty, in the shape of a motor truck delivery. He operates two, one and one half ton trucks, which, by-the-way, are usually loaded to two tons. As yet there has never been any trouble in handling this weight around the town, which is very hilly. Mr. Baird considers that trucks are preferable to horses for carting purposes, being cheaper both as to upkeep and saving of time and labor. The trucks are used for delivering lumber and boxes and also in loading or unloading cars of lumber. The distance from plant to station is about a mile. With horses it took one and a quarter hours for every trip to the station with a load of lumber, whereas the trucks make it in three-quarters of an hour. Trips as long as 25 miles have been made with a truck loaded with boxes. There has thus been accomplished in five hours' time something which could not be done with horses at all. It has been found that it is easier to get men to run trucks than to drive horses, and that the repair bills on the trucks are very light.



Plan of Storage Shed for dressed stock

A new departure was made in 1921 in building houses. During certain periods business was found to be slack. In order to keep the men at work and the organization intact, Mr. Baird decided to take a hand at house-building. A number of attractive bungalows were erected and it is his intention to put up others during 1922, thus giving practical expression to the "Build Now" slogan so often heard.

Motor truck and trailer for delivering woodwork and lumber

Are Your Dry Kilns Giving Satisfaction?

Shorter Drying Periods Increase Risks Requiring Greater Care in Operation—Operator of More Importance Than Equipment—Few General Rules for Intelligent Manipulation of Dry Kilns.

By C. A. FIELDS, Toronto*

Are You Interested in Kiln Drying?

From observations made and information gleaned at various plants, the "Canadian Woodworker" is convinced that the woodworkers of Canada are not meeting with the success they should in their drying operations. This may be due in part to the equipment used but the degree of intelligence with which the kiln is operated, plays an important part in results secured. Lumber drying might be termed a basic operation and upon it depends, to a large extent, the success of succeeding operations, and in some cases the quality of the product. Dry kiln operators and the owners of dry kilns do not seem to have kept up with all the developments which have taken place in the kiln-drying field, or if they have, little or no attempt appears to have been made to apply such information to their drying. To this end the "Canadian Woodworker" has arranged to run a series of practical articles dealing with all phases of dry kiln work. These articles are being prepared by practical men who know their subject, and we believe will prove of inestimable value to our readers. Don't miss one. The first appears herewith.—The Editor.

Dry kilns are very much like automobiles; there are many types, many makes, some new and up-to-date while others are nearly worn out. However, the large variety of autos does not compare in numbers to the many different types of drivers,—the human hand at the wheel—each individual having his own peculiarities, but all intent upon the one thing, namely, getting to his destination. So, in turn, we have a large number of dry kiln operators, all perhaps varying to some extent in their theory of lumber drying, but each intent upon the same object, that is, drying his stock in the best possible way, in the least possible time and with loss through degrade reduced to a minimum.

Perhaps in the past more credit was given to the dry kiln for the success of its operation than the apparatus may have merited. To-day woodworking manufacturers are beginning to realize that there are two important phases to the matter of successful dry kilning,—that is, not only the proper type of kiln for their own particular requirements but also an operator who understands the science of wood technology and the working principle of kiln operation. In fact, the two factors are inseparable—with one missing we can not hope to attain the highest point of efficiency in this important phase of the work. In a way, the proper operation of a kiln is more important than the apparatus itself. Now, I do not want to detract from the importance of having a good dry kiln—but of the two evils, a poor kiln or a poor, inefficient operator, perhaps the former is the lesser. An expert operator will get fair results from an inefficient kiln,—I say fair, not even good, let alone the best,—while an up-to-date efficient kiln may give but poor results under the control of an inexperienced man. However, either way we take it, the combination is a poor one and should not be allowed to exist. It is therefore up to the operator to improve himself.

The success of the old type of dry kiln depended not only upon speed and quality of production but also upon their inability to dry lumber at a rate that would injure the stock. Speed was a secondary matter, so if it took two to four weeks to get lumber out properly, little thought was given to the time factor. Production to-day calls for a far greater output from each and every machine, which in turn requires dry kilns able to produce properly cured lumber in the least possible time. Such a change in equipment was followed by improvement in kiln operation, which revolutionized many of the old theories. This brings us to a better realization of the importance of the dry kiln operator.

Faster Drying Means Greater Risks

Going back to our symbolical comparison of the auto and kiln, it is one thing to drive a light, low powered car but altogether a different proposition to take the wheel of a high powered, specially built racer. Put the average light car driver into the finest, most up-to-date, high powered machine, with all modern conveniences of control, and turn him loose with out proper instruction and what is very apt to occur? Power means speed, and speed increases risk, the increased responsibility of which can be borne only by those specially prepared to carry it So with a modern, high powered drying apparatus, it requires an operator who understands the working principle of his kiln, along with practical knowledge as to the theoretical and practical technicalities of lumber drying.

The operator should regard the dry kiln as a machine which will maintain any set of drying conditions he may consider, either from experience or upon advice, to be proper for the condition of the lumber.

This kiln should contain equipment for producing heat, humidity, circulation and ventilation: ample in size, flexible in arrangement, properly distributed and adequately controlled. It is in effect like an auto mobile, with plenty of power, speed and road ability, and exactly similar to the automobile in that it depends largely on the operator (driver) for efficient performance. It is therefore the operator's duty to make himself an efficient "driver" of the dry kiln.

Responsibility of Operator

More lumber can be ruined with the present types of dry kilns if not properly operated, than with the old types. Modern methods resulting in fast drying makes necessary the training of our kiln operators.

*Canadian representative, National Dry Kiln Co., Indianapolis.

This branch of the woodworking industry is receiving more attention and dry kiln operation is becoming a profession instead of a job. Some manufacturers, rather than hire an outsider who has been specially educated to this profession, take it upon themselves to bear the expense of sending their operators to some school or laboratory for a special course in dry kiln operation. Such a move is highly commendable and the results are usually well worth the cost. Many operators are rusty and need such a training. However, it is quite often left to the ingenuity of the individual to acquire the desired knowledge and then to keep up to date in the pursuit of his vocation.

The dry kiln operator is responsible for the success of one of the most important phases of commercial manufacturing. It is very essential that he shall regard himself as a willing and working helper in making his factory turn out the best furniture or auto body or interior trim or what not, in the world. He should recognize that it is the function of the organization of which he is a part to make every phase of the manufacturing process one-hundred per cent efficient, if possible. His part in directing the initial process of manufacture should appeal to him as perhaps the most vital part played by any member of the producing personnel.

His dry kilns are, as it were, the gateway to the factory. Quantity of production often depends on the amount of dry and properly conditioned lumber which he can deliver to the cutting room. Quality of finished product starts with quality of dried stock. No amount of excellent or careful workmanship can make a really good article out of an improperly conditioned piece of lumber. On the other hand, even poor jointing and machining can often be camouflaged in the finishing room, if the lumber is really in prime condition and will hold its dimensions and form.

A Few Simple Rules

A great amount of literature has been written upon drying methods and kindred topics. To discuss this subject fully would necessitate details of too great a length. Nevertheless, there are a few general rules, which apply in a practical way, to all kiln operations. I shall list a few of the most important of these which should be observed, if the lumber is to be properly conditioned, in the least possible time and with a minimum loss.

The operator should make careful test readings and records, both before and during the drying of the lumber.

Tests should be made to determine the moisture contents of the stock before entering the kiln. Such a test will give the operator data on which to base his treatment of the lumber.

Tests should be made at stated intervals during the drying periods. For this purpose test boards should be inserted in the kiln trucks, from which samles may be taken. Always try to get an average representative sample. Pick out a good solid, heavy piece or, better still, take two or more sections out of as many different boards and take them out of the pile one-third of the distance from the bottom (the top pieces may be drier than the bottom pieces). If two or more tests are made for moisture, it is safer to operate according to the high moisture content rather than according to the average of the pieces.

At the same time tests are made for moisture content, the operator should make tests for case-hardening. If the lumber becomes case-hardened in drying, it practically stops the drying process, or at least slows it up to a great extent, frequently resulting in hollow-horning, cupping, internal strains and many other evils which effect the stock throughout the entire manufacturing process.

The operator should keep a record of the various runs, showing processes followed. Such a record should note the temperatures, humidities and degrees of ventilation used from time to time. These records will be valuable in many ways, and in case of trouble will show where the trouble may have occurred. Recording a successful operation will enable the operator to repeat and secure similar results on subsequent occasions. A record should be kept showing the condition of the lumber at intervals of twelve or twenty-four hours, from the time it was put into the kiln until the drying is completed. This record should state moisture content and should remark whether or not case-hardening, checking or hollow-horning was apparent.

With the proper type of kiln, that is, an apparatus ample in power, flexible in arrangement, properly distributed and adequately controlled and with an operator who will diligently and intelligently follow general rules and instruction it will be possible to do anything with the lumber that it will stand. Speed is then only a matter of the operator's individual ability. I would recommend that the operator acquaint himself in a broad way, at least, with the technical data available on the subjects of forestry and wood technology. He should at least be familiar enough with these subjects to recognize the condition of the lumber as it gradually dries.

Why Lumber is Steamed

From the questions asked by numerous students taking the short courses in kiln drying at the Forest Products Laboratory, Madison, Wis., it is evident that many who operate kilns and handle lumber do not understand the object of steaming lumber in a kiln. There seems to be a common impression that the purpose of steaming lumber is to "remove the sap." This is far from being the fact, for when lumber is steamed it takes on moisture, as a rule, instead of giving off anything.

The reason for steaming lumber during drying depends on when it is done, but nearly always the treatment is given for one of the following purposes: (1) to heat lumber through quickly at the start; (2) to relieve stresses which otherwise would produce checking, casehardening and honeycombing; (3) to equalize the moisture content and condition the lumber ready for use at the end of the run; (4) to kill fungi and insects in the wood.

When lumber should be steamed, how long the treatment should last, and what temperature should be maintained, are points which have been determined at the Forest Products Laboratory by experiments on many species of wood. A thorough understanding of the steaming operation is essential, because the whole kiln charge can easily be ruined by too severe a treatment. One of the chief needs of many commercial kilns is proper steaming facilities, without which a high degree of success in the artificial seasoning of wood is impossible.

Furniture Manufacturers Win Civic Honors

H. R. Magwood, F. E. Coombe Furniture Co., Limited, recently elected Mayor of Kincardine, Ont.

A. E. Malcolm, Andrew Malcolm Furniture Co., Limited, Kincardine and Listowel, who was re-elected mayor of Listowel, Ont., recently.

The Folly of Low Prices

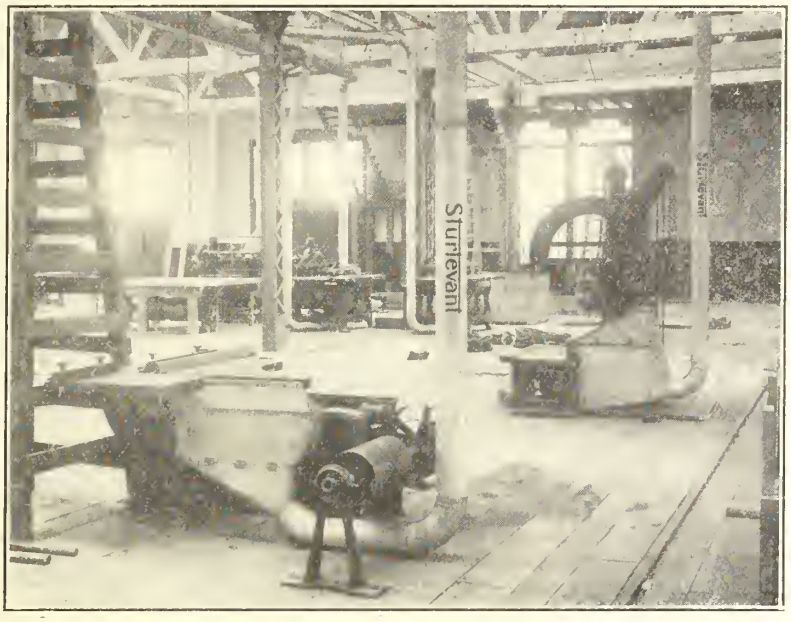
The millwork business is in poor shape to-day because many firms are cutting prices, presumably to beat competitors, yet little additional business is resulting. Sales at a living profit are necessary, otherwise the buying public takes the whip hand, just as they did during the agricultural implement war, and the producer faces bankruptcy. The millwork industry may be a big enterprise, but it is no more safe on an unsound merchandising basis than the smallest bank in the country. Cost, plus overhead, plus a profit is the foundation upon which it must go forward or call in the receiver. There has been much scheming and unfairness on this vital question during the past several months. The directors blame it on the sales manager, and the salesmen blame it on conditions, and conditions are nothing more than cause and effect of merchandising. The policies of merchandising are usually created at the sales manager's desk, and as a rule that is where the blame belongs.

Electricity for Beginners

To those interested in electricity, a book entitled "Practical Electricity for Beginners," which has recently been published by the Manual Arts Press, Peoria, Ill., should prove of interest. This work is a combined text book and shop manual and deals with the different phases of electricity as applied to the home. Dry cells and storage batteries are also touched upon. A review of the chapter headings will give a fair indication of the ground covered. These are,—"Electricity and Electrical Currents;" "Electric Conductors and Insulators;" "Electrical Pressures;" "The Flow of Electrical Current;" "Electrical Circuits;" "Battery Lighting Circuits;" "The Heating Effect of Electrical Current Fuses and Their Purpose;" "Heater Circuit Troubles; how to Detect and Remedy Them;" "Incandescent Lamps and Their Use;" "The Operation of Electrical Lamps;" "Electrical Measurements;" "Dangers in Using Electricity and How to Avoid Them." The subject is covered in a clear, concise manner and is well illustrated with sketches. To those who take a pleasure in tinkering around and looking after their own lighting and heating circuits, the facts here present on construction and repair should be found helpful, not only in saving expenses but also in eliminating annoyances and delays. The price of the book is $1.00.

Facts About Canada

Few people realize that 26,445 Canadian ex-service men have been established on the land and are nearly all making good; that Canada's waterpower development represents an investment of $475,000,000, while the power produced would otherwise require 18,000,000 tons of coal yearly; or that nearly 88 per cent of the world's supply of asbestos comes from the Province of Quebec. The Natural Resources Intelligence Branch of the Department of the Interior, has just issued a revised edition of "Compact Facts", which contains in concise form, information regarding Canada; its area, population, trade and industries; their extent, capital invested, wages paid, values of live stock, principal crops and amounts produced; mineral resources and present production; also forest resources and forest products. Copies of the booklet are available on application to the Superintendent, Natural Resources Intelligence Branch, Department of the Interior, Ottawa.



Dust collecting system on planers in C.P.R. Angus shops, Montreal.

Exhaust Systems for Woodworking Plants

Feeding Refuse Direct to Furnace—Should Be Maintained in Perfect Condition—Keeping Power Consumption Down to Minimum

By H. M. Nichols, B. F. Sturtevant Co., Boston.

[Concluded from December issue]

The stresses and strains on exhaust fans in woodworking systems are unusually severe as not only light dust, shavings and sawdust, pass through them but they are also compelled to stand up under the heavy blows of knots and large wood slivers striking the rotating blast wheels at speeds of over a mile a minute. The fans used for this work are known as "planing mill exhausters". Heavy steel plate is the best material for the roundabouts, side plates and cones, as cast iron has been known to crack under the severe blows which these parts receive. The casings should be well braced with angle iron in order to obtain the necessary stiffness and rigidity. Extremely heavy cast iron hangers, having a wide spread at the base, are necessary to take the belt pull.

There are two methods of driving the fans, belted and direct connected to motor. Belt drive is usually preferable because of its flexibility and the ease with which the speed can be changed to accommodate the systems to changed operating conditions or increased capacity.

Where long shavings or stringy materials are handled special non-choking open type blast wheels should always be used. Double exhausters are installed where head room is scarce or where the main pipes come from opposite directions. In the latter case elbows and bends are eliminated as the main pipes are run directly to the fan inlets.

Centrifugal Type Collector

The centrifugal or "cyclone" type collector is commonly used for separating the shavings and sawdust from the air. In this type of separator the mixture of air and shavings is introduced on a tangent, near the cylindrical top of the collector and the whirling motion sets up a centrifugal action causing the comparatively heavy material suspended in the air to be thrown against the side of the separator, from which position it spirals down to the tail piece, while the air escapes through the stack at the centre of collector. Special construction is sometimes required for fine dust, also some blow pipe manufacturers use a special type of collector for furnace feed, the object being to deliver the material to furnaces as uniformly as possible.

Where more than one fan delivers into a single collector a back-pressure valve is required to prevent one fan blowing back through the other in case the second fan should stop for any reason.

Collectors are sometimes arranged in parallel and by means of a percentage valve the refuse can be delivered to either one at will, while the air is distributed to the two. Special collectors are also furnished for separating sawdust from theshavings.

Feeding Direct to Furnace

In most plants where the refuse is used for fuel, it is delivered by gravity directly from the collector to the furnace. The discharge pipe leading from the bottom of the collector is divided and the junction furnished with a switch or valve so arranged that when the material comes too fast for the fires it can be diverted into a reserve bin.

The furnace feeder should be hinged where it is attached to the lower end of the discharge pipe in order that it may be disconnected from the furnace when the fan is shut down. Also great care must be taken to provide an absolutely tight switch. Other-

wise when discharging refuse to the storage bin, fine sawdust will sift through this valve and settle in the furnace feed pipe, and in case the fireman has neglected to disconnect the feeder from the furnace, the flame may flash back following this train of fine sawdust, into the dust collector.

Much more attention is being given to the problem covering the economic burning of this refuse than in years past, when fuel was so cheap, and special grates, stockers, etc., have been developed, with which considerably better combustion efficiencies are obtained.

Connections for Wood Working Machinery

....The following table is intended to give a general idea of the size of connections often used with woodworking machinery. .This table, however, should be used only as a guide as the proper size connections depend on quality of material, kind of lumber, its condition, whether wet or dry, rate of feed, etc. .....

Type of Machine.	Dia. of Connections.
Circular Saws 12" dia.	4"
" " 12"—24" dia.	5"
" " 24"—40" dia.	6"
Band Saws Blade under 2" wide.	4"
" " " " 2"—3" wide	5"
" " " " 3"—4" "	6"
" " " " 4"—5" "	7"
" " " " 6"—7" "	8"
Small Mortisers	6"
Single End Tenoners	6"
Double End Tenoners	7"
Double End, Double Head Tenoners	10"
Planers, Matchers, Moulders, Stickers, Jointers, etc.

Disc Sander 24" dia.	5"
" " 26"—36" dia.	6"
" " 36"—48" "	7"
Arm Sander.	4"

Maintaining Highest Efficiency

Because of its simplicity the exhaust system usually receives but little attention once it is installed. However, to obtain the best results it should be inspected at suitable intervals and necessary adjustments made. The exhaust fan should be given proper attention the same as any other high speed machine. It must be kept in proper alignment and tightly bolted to its foundation.

Suction hoods which have been removed to adjust the machine should be replaced as soon as the adjustments are completed.

Never start a machine with the blast grate closed as the slight air leakage past the blast grate may draw the refuse into the pipe and clog it.

Disconnect furnace feeders from the furnace when delivering refuse to the storage bins, or when the fan is shut down.

Keep all large heavy blocks, knots, slivers, etc., out of the system as far as possible.

How Power May Be Saved

Blast grates on connections leading to all idle machines should be closed, up to 25% of the connected areas of the trunk line in question. This effects a corresponding saving in power, however, do not close more than this number of blast grates unless especially allowed for in the design of the system. Also do not overload the system by ill-advised additions.

The casual observer sees a wood refuse exhaust system in operation and gives little thought to the complicated problems involved in its design. And yet, unless a careful study of these problems has been made by an experienced designer, it is almost a foregone conclusion that the system will not work well, or the power used will be excessive. Only by careful designing based on correct theory and practical experience can that balance between the parts, so necessary for a successful and economical system, be obtained.

Woodworking Industry Lacks Practical Literature

Few Good Books Dealing With Practical Phases of Work—Would Help in Developing All Around Men—Many Subjects Could Be Covered

By Wm. Snaith, Associate Engineer,
Forest Products Engineering Co., Chicago

Of the writing of books there is no end. Every division of human thought has a literature of its own. The marvel is that enough readers can be found for some of it to pay the cost of printing. It is still more marvelous to find a large and important field hardlp touched as yet. The manufacturing woodworking industry has hardly any literature although what it has is of excellent quality. It is like an island in the midst of its allied industries which are in some cases oversupplied. There are many valuable works on lumber and forestry. Carpentry and joinery are dealt with in many books of varying degrees of value and of the books on the steel square it can be truthfully said that their name is legion.

When we come to manufacturing---chair, furniture, millwork and the like---there are no books to put into the hands of a beginner, or of the skilled worker. Some few exceptions exist to this statement. There is a scholarly work on kiln-drying of lumber and an excellent little book on moulder practice. Apart from these the field is untouched except for the government bulletins, the magazine literature supplied by the technical journals and the catalogues of the machinery and kiln companies. All these are excellent and indispensable to anyone who wishes to remain up-to-date. Yet there remains the lack of a more complete and permanent literature.

How Such Literature Would Help

The value of such a literature as we have in mind would be considerable in maintaining the interest of the rising generation of woodworkers and in increasing their efficiency. In the modern system a man becomes skilled in running one machine or in performing

one operation. If he can study the other operations and machines his outlook is broadened and he is able to see his own work in its true perspective. If he should be called on to change he will have some knowledge of the new work before he starts. We are not producing many all-around men in these days and a comprehensive literature would give us back many of the things we miss through this lack. In the training of present and future foremen also such a literature would be of the utmost value.

What we should like to see would consist in part of a series of books dealing with each of the machines in a mill, well illustrated to show methods of setting up, points to be observed to secure good work and safety in operation. Short cuts and kinks should be covered and old as well as modern machines described. Not all plants are equipped with the most modern machinery. We should like to see books dealing in a practical way with the manufacture of chairs, case goods, tables and upholstered furniture. It might even be possible to include a book on saw-filing but this may be asking too much, there exists such a diversity of opinion on the subject.

Could Include Technical Works

After these books would come others of a more technical nature covering subjects such as the correct thickness and tooth-spacing of saws for a given duty, the correct cutting and clearing bevels for planer and jointer knives, determining the economical speeds and feeds on all machines. The list could be extended further. The problems of management have only been touched by one book so far. There is still much that can be written along this line. The subject of piece-rates alone could fill a large-sized volume.

The need exists. It is acknowledged from time to time by men in every kind of position in the industry. This is written to put the matter definitely before those most directly concerned in the hope of stirring up comment and action. By way of concrete suggestion let it be proposed that some of the associations in the furniture world get together as they are doing in connection with the Furniture Publicity campaign and create this literature in part at least. They would be helping themselves to a greater extent than may appear at first sight and the effect would be cumulative, growing as time goes on.

Do You Know Conditions in Your Kiln?

One authority on dry kiln work recently remarked that many woodworkers have a pretty fair idea of the conditions which should prevail in their kilns and while they think they are securing the temperature, humidity and circulation they want, they do not take the trouble to make a few tests and make sure. In other words, they are inclined to take too much for granted. As an instance, one kiln owner figured that he should have a certain percentage of relative humidity at the dry end of his progressive kiln and that the vapor from the steaming chamber, which was at the green end, would give this required humidity. Resting secure in that belief, he operated the kiln for months, and while the results were fair, he was troubled quite a bit by casehardening. A few tests, which necessarily had to be taken inside the kiln and under full operating conditions, were sufficient to prove that he was not getting within 20 points of the desired relative humidity. He knew what he wanted, thought he was getting it, but wasn't.

One of the first maxims for successfully operating a dry kiln is to take nothing for granted. The operator should get right in the kiln and make sufficient tests to satisfy himself that the circulation, humidity and temperature in all parts of the kiln are as he wants them. That is the only way he can be sure, and, unless he knows, he is working in the dark. Perhaps a few tests in your kiln will reveal conditions which may give you food for thought. Why not make a few to-day?

Heads Canadian Lumbermen's Association

Alfred E. Clark, Toronto, was elected president of the Canadian Lumbermen's Association at the convention held recently in Toronto. Mr. Clark, who is vice-president and managing-director of Edward Clark & Sons, Limited, Toronto, wholesale hardwood dealers, is well known to the lumbering and wood-using industries having been interested in lumber and lumbering practically all his life. As a boy he assisted in the logging and manufacturing operations which were conducted by his father. Later, when Mr. Clark, Sr., sold his mill and moved to Hamilton to enter the wholesale field, "Alf." as he is familiarly known, took an active interest in the firm which was then known as Edward Clark & Son. In 1907 the business was moved from Hamilton to Toronto.

A. E. Clark, Toronto

The new president has always been intensely interested in the progress and development of the lumbering industry. He was one of the organizers and chairman for two years of the Wholesale Lumber Dealers' Association, Toronto, and has for a number of years been a director of the Canadian Lumbermen's Association. His activities are not confined entirely to Canada as he is a trustee of the National Wholesale Lumber Dealers' Association, New York, and a former director of the National Hardwood Lumber Association, Chicago. He has always given liberally of his time and energy to anything which might tend to further the lumbering industry.

Under Mr. Clark's capable direction the Canadian Lumbermen's Association should enjoy one of its most active and successful years.

What Waste Do You Figure On Box Stock?

Old Allowance of Ten to Fifteen Percent Not Adequate—Correct Method of Application—Ascertaining True Lumber Costs.

By H. L. Pease, Secretary National Association of Box Manufacturers, Chicago

Waste is an item of no small importance in the box factory. Frequent tests should be made in order to ascertain waste in process of manufacture. This can be done by measuring the amount of raw material passing through the planer and comparing that figure with the amount of lumber contained in the finished product, says a writer in Barrel and Box. The old standard 10 per cent or 15 per cent waste factor cannot be used to-day. Labor efficiency, or more properly, inefficiency, is the cause of added waste, so that what once was fair does not to-day cover the waste account. Each factory must obtain for itself at frequent intervals the percentage of waste to charge to the lumber bill.

To quote from the Uniform Cost Finding and Accounting Plan adopted by the National Association of Box Manufacturers:

"The percentage of waste is commonly spoken of as being related to the quantity of raw material out of which it develops. The manufacturer must be careful, however, to distinguish between the percentage so arrived at, and its application to this product in which he recognizes only the net feet from which the waste has already been eliminated.

Correct Application of Waste Percentage

Thus as an illustration, the following example might be cited:

Material delivered to the factory and used.... 1,000 ft.
100 boxes manufactured, contain.....800 ft.

Material wasted..... ....200 ft.

Percentage of waste, 20 per cent.

Percentage of material in product, 80 per cent.

We will now reverse the proceeding by beginning with the known quantity of material in 100 boxes, and show that the addition of that percentage to the finished feet will not correspond with the number of feet used:

100 boxes contain..... ....800 feet
Add waste—20 per cent..... .....160 feet
Total material accounted for in cost..... ..960 feet

This is obviously wrong, but in order to dispel any doubt regarding this point, the above illustration is cited. As a standard method of figuring waste into finished product, the following is recommended:

100 boxes contain..... ....800 feet
This equivalent to 80 per cent of the amount of lumber required.
Therefore, divide 800 feet by .80, and the result is the amount of lumber required, or..... ....1,000 feet

Waste: Waste is a by-product, the sale of which should be accounted for as a separate product. The money derived from such sale should never be used as an offset of lumber values. We are not in business to manufacture waste; otherwise, we would turn our entire product into sawdust and shavings. It is a separate product and should be so treated.

In computing the cost of raw material into the mill the replacement value should always be considered. In order that there may be no misunderstanding as to the replacement value, we wish to call your attention to the fact that this value is not the average market price f. o. b. cars shipping point, but is the market price f. o. b. cars delivery point. The average delivered price on round edge box lumber is the going market replacement value.

Yard costs of:

: A proper charge to lumber of yard rental, or, in case of yard ownership by the mill, a proper rental or interest charge should be made on land investment.

Second: Insurance cost on lumber in yard.

Third: Taxes on lumber in yard and yard valuation.

Fourth: Interest on money invested in lumber, not only that which is being carried in the yard, but that which is being held at outside points for shipment. This is one of the most important items to consider, for today such interest money will cost in the neighborhood of 8 per cent per annum.

Fifth: All yard labor, such as handling costs and teaming from yard to mill.

This is the basis of box factory cost accounting. Without this first step in "putting our house in order" we cannot hope to arrive at any figure that will in any way be representative of the costs through the factory.

These first costs are easily determined.

Know your lumber costs up to the planer. This is the first step in Box Factory Cost Accounting.

Are Our Values Too Low?

At a quarterly meeting of the North Carolina Pine Box & Shook Manufacturers' Association held recently at Baltimore, the subject of box costs came up for discussion. One of the members tabled his cost figures and in the discussion which followed it was brought out that after adding a reasonable allowance for profit, these figures were well above the prevailing market levels. According to statistics presented by another box manufacturer, his net cost, without allowing for any profit, was several dollars above the general level of prices.

One wonders if these are exceptional cases or if box prices on the average are near or below production costs, based, of course, on replacement values. Take in Canada. It is not probable that all box manufacturers have accurate cost systems in operation in their plants; in fact it is doubtful if outside of a few of the more progressive members of the industry, more than the merest outline of what constitutes accurate costs is known to Canadian box men, let alone having some efficient cost system by which they can tell exactly how much their product costs installed in their plants.

Upholstering and Trimming

Modern Upholstering

Preparing Back of Chair for Down Filled Cushion —How Patterns are Made and Coverings Cut

[Continued from December issue]

The back is then lightly double-stuffed with the edges shaped up and stitched, as shown in Fig. 69. Following this, a layer of hair is placed over all the back and woven into a compact mass, as shown in Fig. 70. The back at this stage may be covered with muslin if desired, but inasmuch as the down-filled cushion is sewn to the stitched edge, the under muslin may be dispensed with allowing the cushion itself to provide covering for the hair. It is important that the shape of the stitched edge should be kept to a uniform curve, rounding off at the top of the chair and finishing just even with the curve of the side post at A. Fig. 70.

This shape should be the same on both sides of the chair, and when the upholstering has reached the stage already described, a pattern of the outline of the back, from B to A, and of the stitched edge from A to C of the same figure, is drawn on a piece of cardboard, see Fig. 71. The line A to C will be the under part of the down cushion and the side border of the cushion must follow this line without any deviation. Therefore, with the outline A—C drawn on the cardboard as a pattern, proceed to lay out the dimensions of the border of the cushion, as indicated in Fig.72.

In the case we are illustrating, the border of the cushion at its deepest part is two inches, and this dimension is marked off on the cardboard, Fig. 72, and the edge of the cushion is sketched diminishing toward the top finishing at A in a graceful curve, as shown in Fig.73.

The various sections of the cushion are filled, as already indicated in a previous instalment, and the completed cushion is sewn to the stitched edges, as shown in Fig. 74.

Too much stress cannot be laid upon the importance of shaping the cushion in this way, because by no other plan is it possible to obtain a proper allowance on the borders of the down casing and at the same time avoid objectionable wrinkles when the filled cushion is attached to the stitched foundation.

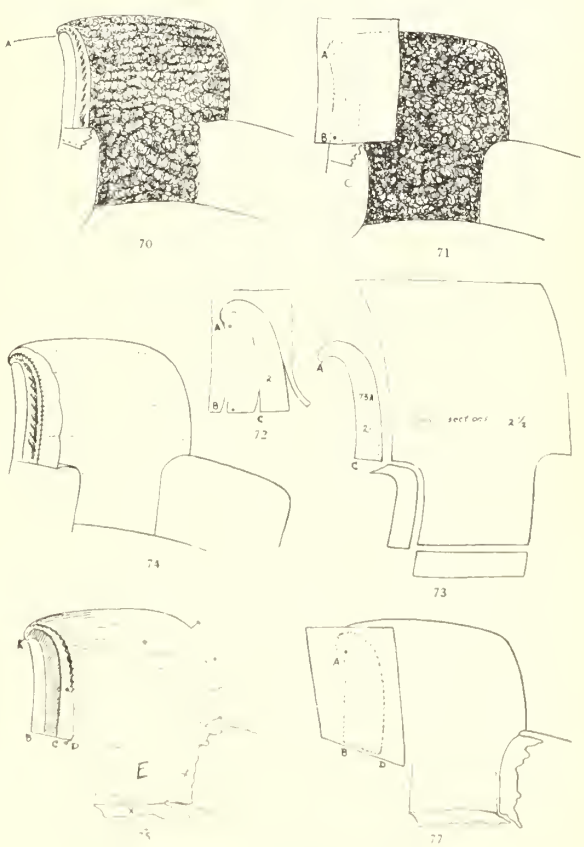
Having reached the stage shown in Fig. 74, measurements are taken of the back, and the covering planned accordingly. The main covering indicated by the letter E in Fig. 75 is cut to shape and pinned into place with tacking strips of muslin sewn at the points where the covering must reach through to the back for attaching (see Fig. 75) and the fullness of the rounding edge from B. A is taken up by overcasting the material with a stout stitching twine in such a way as to shirr the fullness on the stitches.

The tighter the twine is pulled the more closely the fabric will be shirred and in this way the surplus fullness will be dispossed of without the necessity of pleats. The fabric edge from D to A is pinned to the cushion temporarily while the shirring is being done to give it the proper shape.

Another cardboard pattern of the back is now made, following the plan explained in connection with Fig. 71, and this pattern must have the true shape of the back as now outlined by the lines A B, and D in Fig. 75, with tacking allowance added between A and B and stitching allowance between D and B. See also diagrams Figs. 77 and 78.

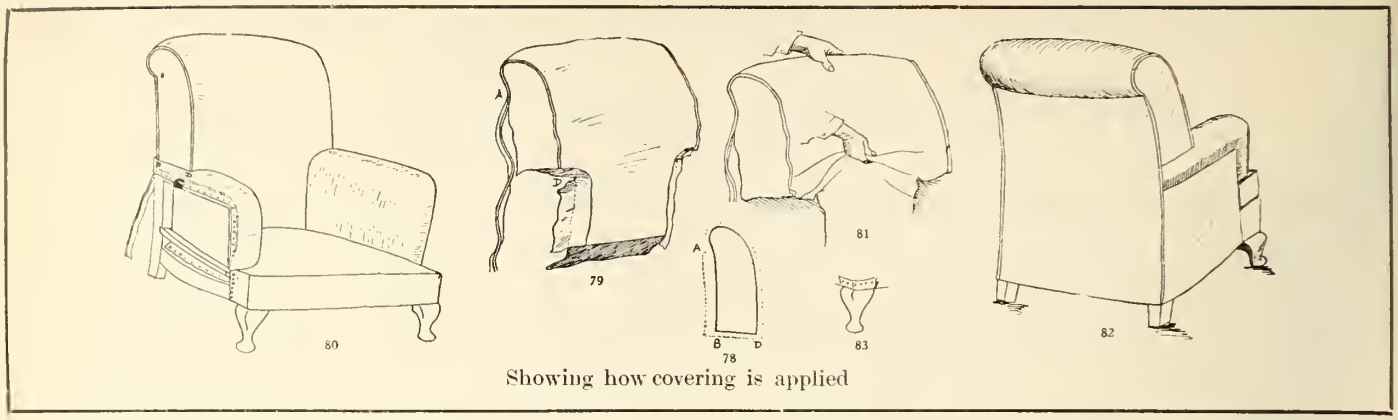
The covering, E, is now removed, and the other parts indicated in Fig. 78 are attached with such tacking strips as are necessary to draw between the seat and back and when the arms and back, and the covering assembled as a loose cushion cover shaped like Fig. 79.

It will be noticed that the welt which is attached permanently from point D around to point A is made long enough to reach to the bottom of the chair. This extra length is provided so that the back of the chair may also be finished with welt as indicated in our Fig. 57 and also in Fig. 80.



Development of down-filled Back

The covering Fig. 81, is slipped on over the top of the back and pulled down into place. After all the edges have been tacked, it is backsewn from D to B, Fig. 80. The outside arms are put on and the welt on the back edges carried down to the base of the chair and finally the outside back is back-tacked to the top rail, even with point A of the various figures, and then sewn to the welt all around, making a finished



Showing how covering is applied

pearance of outside back in Fig. 82.

To avoid showing tacks above the shoulders of the front legs, a piece of material is backtacked above each leg, as shown in Fig. 83, and to this the bands are blind-sown, the balance of the bands and linings being tacked beneath the rails.

The seat cushion of this chair is made, in all respects, the same as the cushion shown in the chair previously treated, with the addition that the front corners are shaped to fill out the spaces where the arms do not extend to the front edge of the seat.

We have already indicated in connection with the chair described in previous instalments the method of taking the pattern and the filling of the cushion, and space need not here be taken to repeat the same instructions.

(To be continued)

The Demand for Chesterfields

Once in awhile one hears the opinion expressed that the popularity of chesterfields and, in fact, stuff-over furniture in general, is on the wane. No doubt this suggestion is the result of some temporary lull or quiet spell, for the manufacture and sale of this type of upholstered furniture goes on at a fairly even rate. The appearance, serviceability and comfort-giving qualities of high-grade chesterfields are such that it is likely that they always will be in strong demand.

You will notice that the term "high-grade" is used in the last sentence of the preceding paragraph. The manufacturers of upholstered furniture should make strenuous efforts to maintain the quality of their product. Placing a cheap line on the market is only a temporary expedient, giving only temporary gains; it is not conducive to steady businesss, and, in addition, through time the demand for and reputation of the better grades is sure to be affected.

Furniture dealers are continually clamoring for cheaper chesterfield suites. They do not appreciate the true worth of the better-grade product but look at the price only and holler for something at less money. Some upholsterers have set out to cater to this demand and are producing a line that is cheap in every way; cheap material, cheap filling, cheap construction and low in price, but dear at any price. A dealer sells a suite of this kind to a customer and after it has been in use a short while, the backs and arms are loose and baggy, the seats have gone soft and flat and the pieces look worn out. They have, in fact, outlived their period of serivce. What is the result? The customer is dissatisfied and condemns chesterfields in general. Perhaps a complaint is laid with the dealer who in turn feels injured and makes a kick to the manufacturer. In the long run nobody is satisfied. Not a very attractive or desirable business.

Now, who is to blame? The manufacturer blames the dealer for demanding a cheap product while the dealer blames the manufacturer for producing a worthless suite. In reality, both are to blame. The dealer should be sufficiently interested in the lines handled to know something of their construction and value. He should have sufficient pride in his business and be sufficiently well informed to want to sell only serviceable articles and be able to point out why one is good value while another at, perhaps, a lower price, is not worth having. Actually the manufacturer who, regardless of his reasons, produces an inferior article, should shoulder the full blame and take full responsibility. Instead of yielding to the dealers' cry for cheaper chesterfields, he should take the trouble to show that the cheaper article is dear at any price and why. More than that he should refuse to have anything to do with the production of a cheap line. As a rule there is little, if any, money in it, very little satisfaction, no goodwill and no reputation to be made, at least not a desirable one.

The manufacturer of cheap chesterfields cannot pass the buck. He and he alone is the responsible party. If he has any regard for his own reputation and for the permanency of his business, this question is worth some deep consideration. There may be different qualities and different grades at various prices but there is only one kind of a line to produce, and that one that will give service and satisfaction.

Industrial Significance of Standardization

1—Stabilizes production and employment, since it makes it safe for the manufacturer to accumulate stock during periods of slack orders, which he cannot safely do with an unstandardized product.

2—Reduces selling cost. This is generally overlooked. Possibilities of reduced costs are generally even greater in distribution than in production.

3—It enables buyer and seller to speak the same language, and makes it possible to compel competitive sellers to do likewise.

4—In thus putting tenders on an easily comparable basis, it promotes fairness in competition, both in domestic and in foreign trade.

5—It lowers unit costs to the public by making mass production possible, as has been so strikingly shown in the unification of incandescent lamps and automobiles.

6—By simplifying the carrying of stocks, it makes deliveries quicker and prices lower.

7—It decreases litigation and other factors tending

to disorganize industry, the burden of which ultimately falls upon the public.

8—It eliminates indecision both in production and utilization,—a prolific cause of inefficieny and waste.

9—By concentrating on fewer lines, it enables more thought and more energy to be put into designs, so that they will be more efficient and economical.

10—By bringing out the need of new facts in order to determine what is best and to secure agreement on most questions, it acts as a powerful stimulus to research and development,—and it is thus in decided contract to crystalization resulting from fixity of mental attitude.

11—It is one of the principle means of getting the results of research and development into actual use in the industries.

12—It helps to eliminate practices which are merely the result of accident or tradition, and which impede development.

13—By concentration on essentials, and the consequent suppression of confusing elements intended merely for sales effect, it helps to base competition squarely upon efficiency in production and distribution and upon intrinsic merit of product.

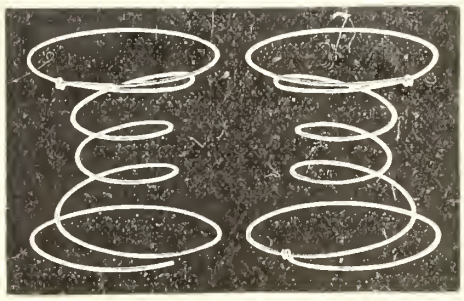
14—Standardization is increasingly important for the maintenance and development of foreign trade. There is strategy in nationally recognized" American" specifications.

15—The efficiency of competing countries, increasing through national standardization programs, is liable to transfer competition from foreign markets to our own shores.

16—Joint efforts in bringing about standardization within and between industries almost invariably leads to better understanding and to benefical co-operation along other lines,— a step toward the integration of our industries.

The B. F. Sturtevant Co., Galt, Ont., and Boston, Mass., had an interesting display at the annual convention of the Canadian Lumbermen's Association held in Toronto recently. They were showing a small, but complete, model of their forced circulation, high humidity lumber dry kiln. The kiln proper was constructed of plate glass so that the way in which the air is forced through the lumber piles was clearly shown. Considerable interest was evinced in this display. Kenneth Redman, Boston, manager of the dry kiln department, was in charge.

"IDEAL"
FURNITURE and UPHOLSTERY
SPRINGS



Double or single cone, plain or knotted ends, in any height, shape or gauge of wire.

All "Ideal" Springs are made of "Premier" Brand—the best steel spring wire obtainable. Before shipping, the springs are japanned and heat-treated, giving an enamel finish and making the spring more resilient.

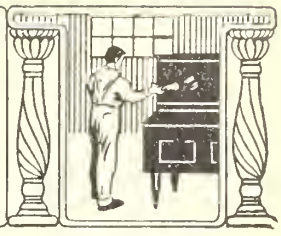
THE FINISHING ROOM



Effects of Chemicals on Wood

Acids and Chemicals Play Large Part in Modern Finishing—How Different Acids Act on Wood — Suggestions for Different Shades

By R. J. Winton

Many of our most attractive finishes owe much of their depth of tone and richness of color to some one of the many acids and chemicals employed by the present-day finisher. Such acid may have been applied direct or may have been used in the stain, according to the kind of acid and the finish and tone desired. Acids are employed chiefly on hardwoods and more particularly on oak, mahogany and other woods which contain tannic acid. They do not seem to have much effect on dry pitchy or sap wood, and have little or no effect on such woods as pine, spruce, basswood, whitewood, etc.

The effect of acid or chemical stains is permanent for they change the actual chemical nature of the wood itself. In addition, they produce clear, bright tones, without any signs of the muddy, cloudy effects so often noticed when pigment stains are used. The results secured are permanent and do not exhibit any tendency to become lighter or fade out, even when exposed to the strongest light. In the furniture and piano industries, such stains are used to produce weather and fumed oak and other finishes of a similar nature. These shades are usually secured by darkening the wood though certain chemicals actually change the color of the wood.

In General Use

The commonest of all acid or chemical stains is ammonia. This is used principally on oak or mahogany. It is reduced with water to the desired shade and applied with a sponge, cloth or fibre brush (it will destroy a hair brush). In this, as with all acid stains, it is better to dilute it more than is absolutely necessary and apply successive coats, instead of attempting to use it full strength. Ammonia does not leave any residue when it evaporates so does not affect subsequent coats of varnish or shellac.

Ammonia is also used in producing fumed oak by the fuming process. Fuming produces a fairly even shade, and unless a lot of steam was used does not tend to raise the grain. The depth of tone required governs the length of time the articles should remain in the fuming box. Usually twelve hours is necessary.

Effects of Different Chemicals

What is probably the oldest of chemical stains is ordinary lime water. This is secured by slaking common burnt lime. It has been employed for many years by hardwood finishers for securing a deep, rich tone on mahogany. It is brushed over the surface and allowed to remain until thoroughly dry, when the lime will brush off. After the lime has been removed, the wood is washed thoroughly. A coat of vinegar is given to neutralize any alkali which might remain and which would injure the varnish coats.

Dark stains may be produced with caustic soda or caustic potash. These chemicals are difficult to handle and great care must be exercised in their use. If not applied properly, they are liable to affect the succeeding coats of varnish and shellac.

Chromate and bichromate of potash, also permanganate of potash are sometimes used to secure the once popular golden oak. If used on mahogany, the result is an attractive antique effect.

Picric acid when applied to walnut, gives a slightly yellow effect. This is often used to liven up the tone of the wood. If expense is no drawback, a warm brown tone may be secured with iodine, but this can hardly be classed as a finishing material.

Neutralizing Alkali Before Varnishing

Half a pound of green copperas, dissolved in a gallon of warm water is sometimes used to deepen and fix the results of chemical stains. When an alkali stain has been used, vinegar will neutralize the alkali and save the varnish coats.

Verdigris dissolved in soft water or vinegar, will produce a green shade on almost any wood.

A solution of sulphuric acid and water, equal parts of each, will give what might be called a sixteenth century effect on oak.

Walnut may be made to resemble rosewood by giving the wood an application of bichromate of potash dissolved in water.

For a metallic black apply a strong solution of nitrate of silver and afterward expose the work to strong sunlight. This is applicable to any wood.

Practically all chemicals and acids used in the finishing room are active poisons and should be handled accordingly. The hands should be washed thoroughly after working with such stains. Some workmen make a practice of using rubber gloves. The idea is a good one and should be followed wherever possible.

Testing Pumice for Impurities

Pumice stone is of volcanic origin and is found in the craters of extinct volcanoes. It is in reality the solidified spume or foam formed by escaping steam on the surface of molten lava that has been thrown out by a submerged volcano. Italy is the chief source of supply. Many of the mines are worked by convict labor. After being mined, it is ground and sifted through wire screen and through the meshes of special silk. It is in this way that the different grades are secured. It is an easy substance to adulterate and thus is often mixed with other materials such as silicate. The test is to take a little in the palm of the hand and, after wetting it, rub it with a finger. If any soft dust that does not cut is felt, like chalk or whiting, one may be sure that it has been adulterated.

Do You Spray From Front or Back of Top?

Operator Should Study Work for Best Results—Cleanliness is One of First Essentials—Keep Spray Close to Work

By C. H. C.

The spraying machine is like every other machine in that it will do the work for which it is intended if manipulated right but it will not do work for which it is not intended. The finishing room foreman who knows his job knows when the spraying machine can be used to best advantage and when it is better to have the work done by hand.

Where it is right and proper to use the spraying machine for varnishing it is a great saver of time and of labor. These two items mean much in modern finishing rooms. Time schedules are part of the production forces that make profits and finishing room foremen know that they must be adhered to. Labor saving is a great and proved economic gain to every one concerned. Where time and labor can be saved by the use of a spraying machine every effort that will increase the effectiveness of the operation must be brought into action.

Judgment in Selecting Spray Jobs

Of course, there is work that cannot be done by the spraying machine and it is folly to try to make any machine do things which it should not be called upon to do. There is a distinct loss every time such procedure is forced in any finishing room.

The first thing that a good finishing room foreman sees to is to ascertain if the spray gun is clean. He constantly cautions the operator about this and never leaves the matter to chance but demands "to be shown" every time. This close inspection should be put upon every part of the gun and hose. Inspection should be made to prove that the gun and hose are not leaking air or varnish.

In using the spraying machine some finishing room foremen insist upon having both the air and varnish heated. Others only heat the air. The best way is to try and find out which is best under given conditions and then do what is necessary for best results.

Not Too Far From Work

In several finishing rooms, careful watch has shown that many operators of spraying machines stand too far away from their work. It appears to be best to stand as near the article being sprayed as is possible. Of course, the spray will be thrown some distance but that is what really causes the trouble. The temperature some distance away from the end of the gun may be many degrees different than the temperature close to it and that difference may be the measure between a good job and a poor one. The varnish that is carried the farthest in a spray from the gun will naturally be exposed to more cooling than that thrown from the gun at the shortest possible distance.

Spray from Nearest Edge

In one finishing room close attention to these facts disclosed many disadvantages which admitted of solution and betterment. The operator was using the spraying machine to varnish large table tops. He began his work on one side of the table top farthest from him and worked towards himself. Each time he threw the spray across the table top the air was blown across the part that had been varnished and that caused the varnish to set and prevented proper flowing. A change was made and the spraying was begun on the side of the table nearest to the operator and the air was then blown on to the bare top and did not reach the parts already varnished and a far better job, of course, was the result. It is generally conceded by all that varnish should never in any case be applied in a draft and yet, when using a spraying machine to save time and labor, the operator was making a draft himself before he changed.

Spraying varnish can be made an asset in those finishing rooms where the foremen and the operators study conditions and use their best judgment in the operation of the machines. The machines cannot work by themselves and they do so much as to deserve the best attention and skill of the operators and those in charge of the work.—"Finishing Facts"

Selecting and Training Salesmen

(Continued from page 71)

est asset. You cannot see personality, you just sense it. It is a thing you cannot define, and the greatest element of personality is health. His eyes are bright and his step springy, and he thinks just a little faster than his prospect; he cannot do it unless he has 100 per cent. health.

One of the reasons salesmen fall down is because they are not supervised closely enough. I do not mean bossed. We do not know the meaning of "Boss" in our organization.

Supervision means for one thing that you get out with the salesmen occasionally, especially the men in the Provincial territory, who are meeting to-day probably the greatest resistance in the history of trade in this country. They are only human, they get lonesome, they have gone a week perhaps without an order. The greatest asset for a salesman to have is a big stout heart, not knowing the meaning of "Quit." Well, that man needs supervision it might be termed, or Assistance, a new injection of Enthusiasm, which he can only get from an executive higher up.

As to training. How many firms do not seem to realize its necessity? I have had men come to me who seem to have been given a price list and an order book and left to grab any further knowledge they could out of the atmosphere. Those salesmen are going to run against other men in parallel lines who have been trained, and we have got to see to it that our men are epuipped to meet these trained men. If in your own judgment the new salesman is the right material for your organization, then it is worth spending time and money to give him the proper ammunition.

The furniture factory being erected at Milverton by the B. & N. Planing Mill, is nearing completion. Construction work was undertaken over a year ago and then when the demand for furniture eased off work on the building was stopped. Recently a decision was reached to complete the furniture factory and put it in operation. This plant is to be operated under the name of the Milverton Furniture Company, Limited.

Frank E. Mutton, Toronto

Selecting and Training Salesmen

Constructive Sales Efforts Required for 1922—Where to Look for Good Salesmen—Thorough Training and Knowledge of Line Essential

By Frank E. Mutton, International Business Machines Co., Limited, Toronto

Well made may be half sold; but at the present time the sales problems are seemingly of major importance. Today the manufacturers of furniture and other wood products are having as much difficulty in disposing of their output as they had a short while ago in taking care of the volume of business which was offering. During 1922 the sales problems will probably take first place. In view of this, the following extracts taken from an address on" Selecting and Training Salesmen." delivered by Frank E. Mutton, of the International Business Machines Co., Limited, Toronto, should prove of interest and value to the readers of the "Canadian Woodworker."—The Editor.

Of course I recognize that a sales organization selling a specialty like Time Recorders or Scales is different from one selling a standard article, however, I believe the same fundamental principles apply, and that this matter of selecting and training salesmen is the most important factor facing executives of any concern to-day. It is the salesmen that keep the factory chimney smoking, and the amount of smoke depends on the efficiency of the sales-organization, absolutely.

The quicker we all realize that prosperity depends on the action of our self-starter the better. A good many people are just waiting for something to turn up, even sales managers. To my mind there is nothing "going to happen" until you make it. Instead of the men going out on the 9 o'clock train they will have to go on the 7 o'clock if they are to succeed, and instead of coming in Thursday night or Friday noon, they will come in Saturday morning,—if they are lucky. These are the new conditions that we are facing.

I want to convey this idea; it is not necessary to tell most men these things, it is necessary to "sell" them. In our organization we never tell a salesman to do something. We "sell" the proposition. That is the only way to get the proper co-operation and spirit.. The art of selling is the art of buying. What do I mean?—well, the amount you sell depends on the amount of confidence you can buy, the respect you can buy from the prospective customer. I think that is an important principle to have the sales force memorize.

Now where are we going to get our salesmen? Our experience is that we get our best men through our present sales force. Those men know the policy of the company, they have confidence in the company, they know the calibre of men the company want, and they have seen in action the men that they are going to send in to apply for the position. That is something you cannot do as a general proposition. They know whether he plays pool in the hotel until 2 a. m. or poker until daylight. They know his characteristics through working with him. I emphasize that, because looking back over my experience during the last thirty years I find that the best salesmen it has been my good fortune to secure came through the salesmen we already had.

Another channel is the retail store. We have secured some excellent men who were retail store clerks.

I do not believe it is good business or sound policy to hire a man who is out of a job. That, perhaps, sounds severe, but there is generally some reason why he is out of a job, and it is difficult to get at the true reason. If you are going to put up a "Safety First" sign get a salesman who is in a position.

Now, I want to put before you in thls graphic way, these principles:

Get them clean—Mentally, Physically, Morally, Spiritually.

That to me is "The Bible" in hiring Salesmen. There is no one of those things that you can afford to overlook. And you can test them all out in your interviewing.

Mentally.—The salesman who will consume time telling those stories that we sometimes hear is not clean mentally. The results show physically and morally.

Spiritually.—This is very important. Sometimes we meet a man who does not believe in such things as churches. I am not preaching a sermon, but I know the value of that element, we all do.

Then I would like to add keep them clean as to the environment they live in.

I have a chart on my desk and that is always ticked off 100 per cent. before a man is taken into our organization. Health is most important. If a man has not got 100 per cent. health he is anchored. A lot of talks have been made on Salesmanship; to me Salesmanship is the combination of a lot of qualities. Health is the foundation.

Our company spends a good many dollars a year in taking care of the health of the organization. We talk to them of what to wear, what to eat,&c., &c. A lot is wasted, but some gets home and it does a lot of good. I venture to say when you meet one of our salesmen you find he is "in the pink." If he is not, he will not go out, they are trained not to.

When a salesman approaches a prospect, one of the most important elements in getting that man's order is the salesman's health. Selling is largely a matter of domination. You need all the health and energy at your command to dominate some people; if you are feeling about 70 or 80 per cent. fit, the buyer will do the dominating. Health is the foundation of everything. Take personality, the salesman's great-

Nichols Varnish Drying Equipment

A complete unit of fan, motor, heaters, air compressor, with automatic temperature and humidity controls for the correct drying of all coatings on the finest pianos, talking machine cabinets, furniture, automobiles, etc. A new humidifying air washer, which eliminates all dust and dirt, does away with all spray heads and connecting piping.

Will triple the output of your finishing rooms; decrease the congestion in your factory; reduce investment of goods in process and improve working conditions for your employees.

Better finish, scientifically dried from the inside out.

We will analyze conditions in your plant and submit a proposition covering an equipment suitable for your requirements, whether it be for automobiles, talking machines, pianos, furniture or railroad cars.

We have exclusive authority to issue license to use the Grosvenor Process Patent in all territory East of the Mississippi, Ohio and Detroit Rivers in the United States and Canada, the only varnish drying process that simultaneously subjects the coatings to the action of moisture in excess of natural humidity.

We also manufacture the Nichols Lumber Dryers, Veneer Dryers and Hydraulic Pumps. It will pay you to address us for further particulars.

Increasing the Speed and Decreasing the Cost of Your Finishing Room Operation

How practical, how advantageous and how dependable DeVilbiss Spray-painting equipment is, has been demonstrated in finishing rooms of every size and line.
Not merely in dozens of finishing rooms, but in thousands of them. Not only where a few different kinds of articles are handled, but where every kind, size and grade of wood or metal product is finished. Not alone where varnishes, enamels or lacquers are used, but where every kind of liquid finishing material is applied. The

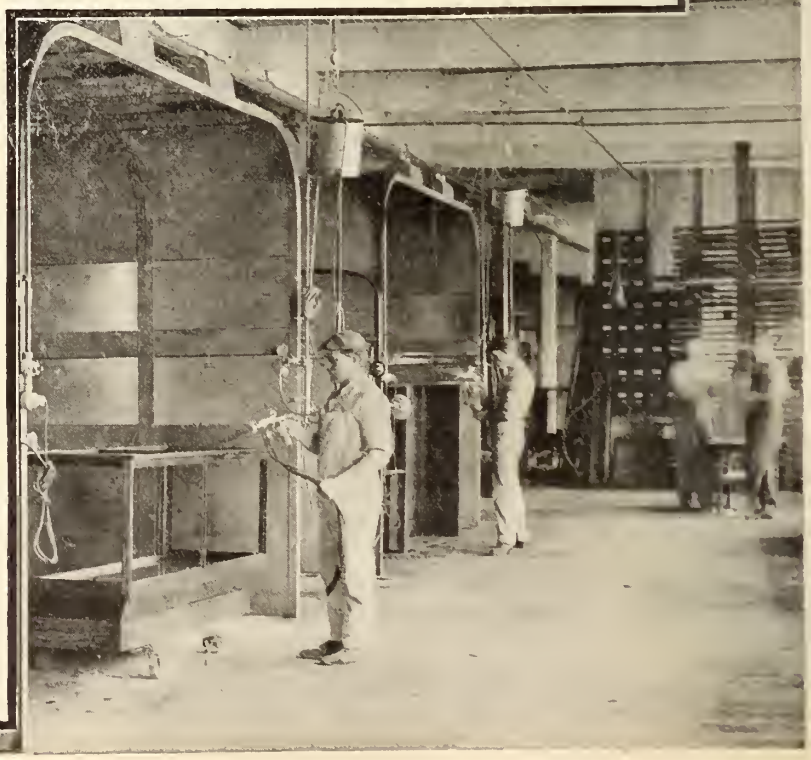
DeVilbiss
Spray-painting System

offers a complete, adaptable and guaranteed service. The finishing operation is speeded up 4 or 5 times over hand-brushing. A perfect, uniform coating is applied on all jobs. Working conditions are made more healthful and safer. Operating and upkeep costs are reduced to the minimum.

With your consent, we'll gladly tell you whether and how the DeVilbiss System can be of service and profit to you.

The DeVilbiss Mfg. Co.
3718 Detroit Ave. *Toledo, O., U.S.A.*

Paint your factory walls faster and better with the DeVilbiss Spray-painting portable equipment. Let us explain.



Linseed Oil has its best equivalent in "FLAXICON." Either in boiled or raw, is elastic, durable and waterproof. Working to the best advantage with colors ground in oil.

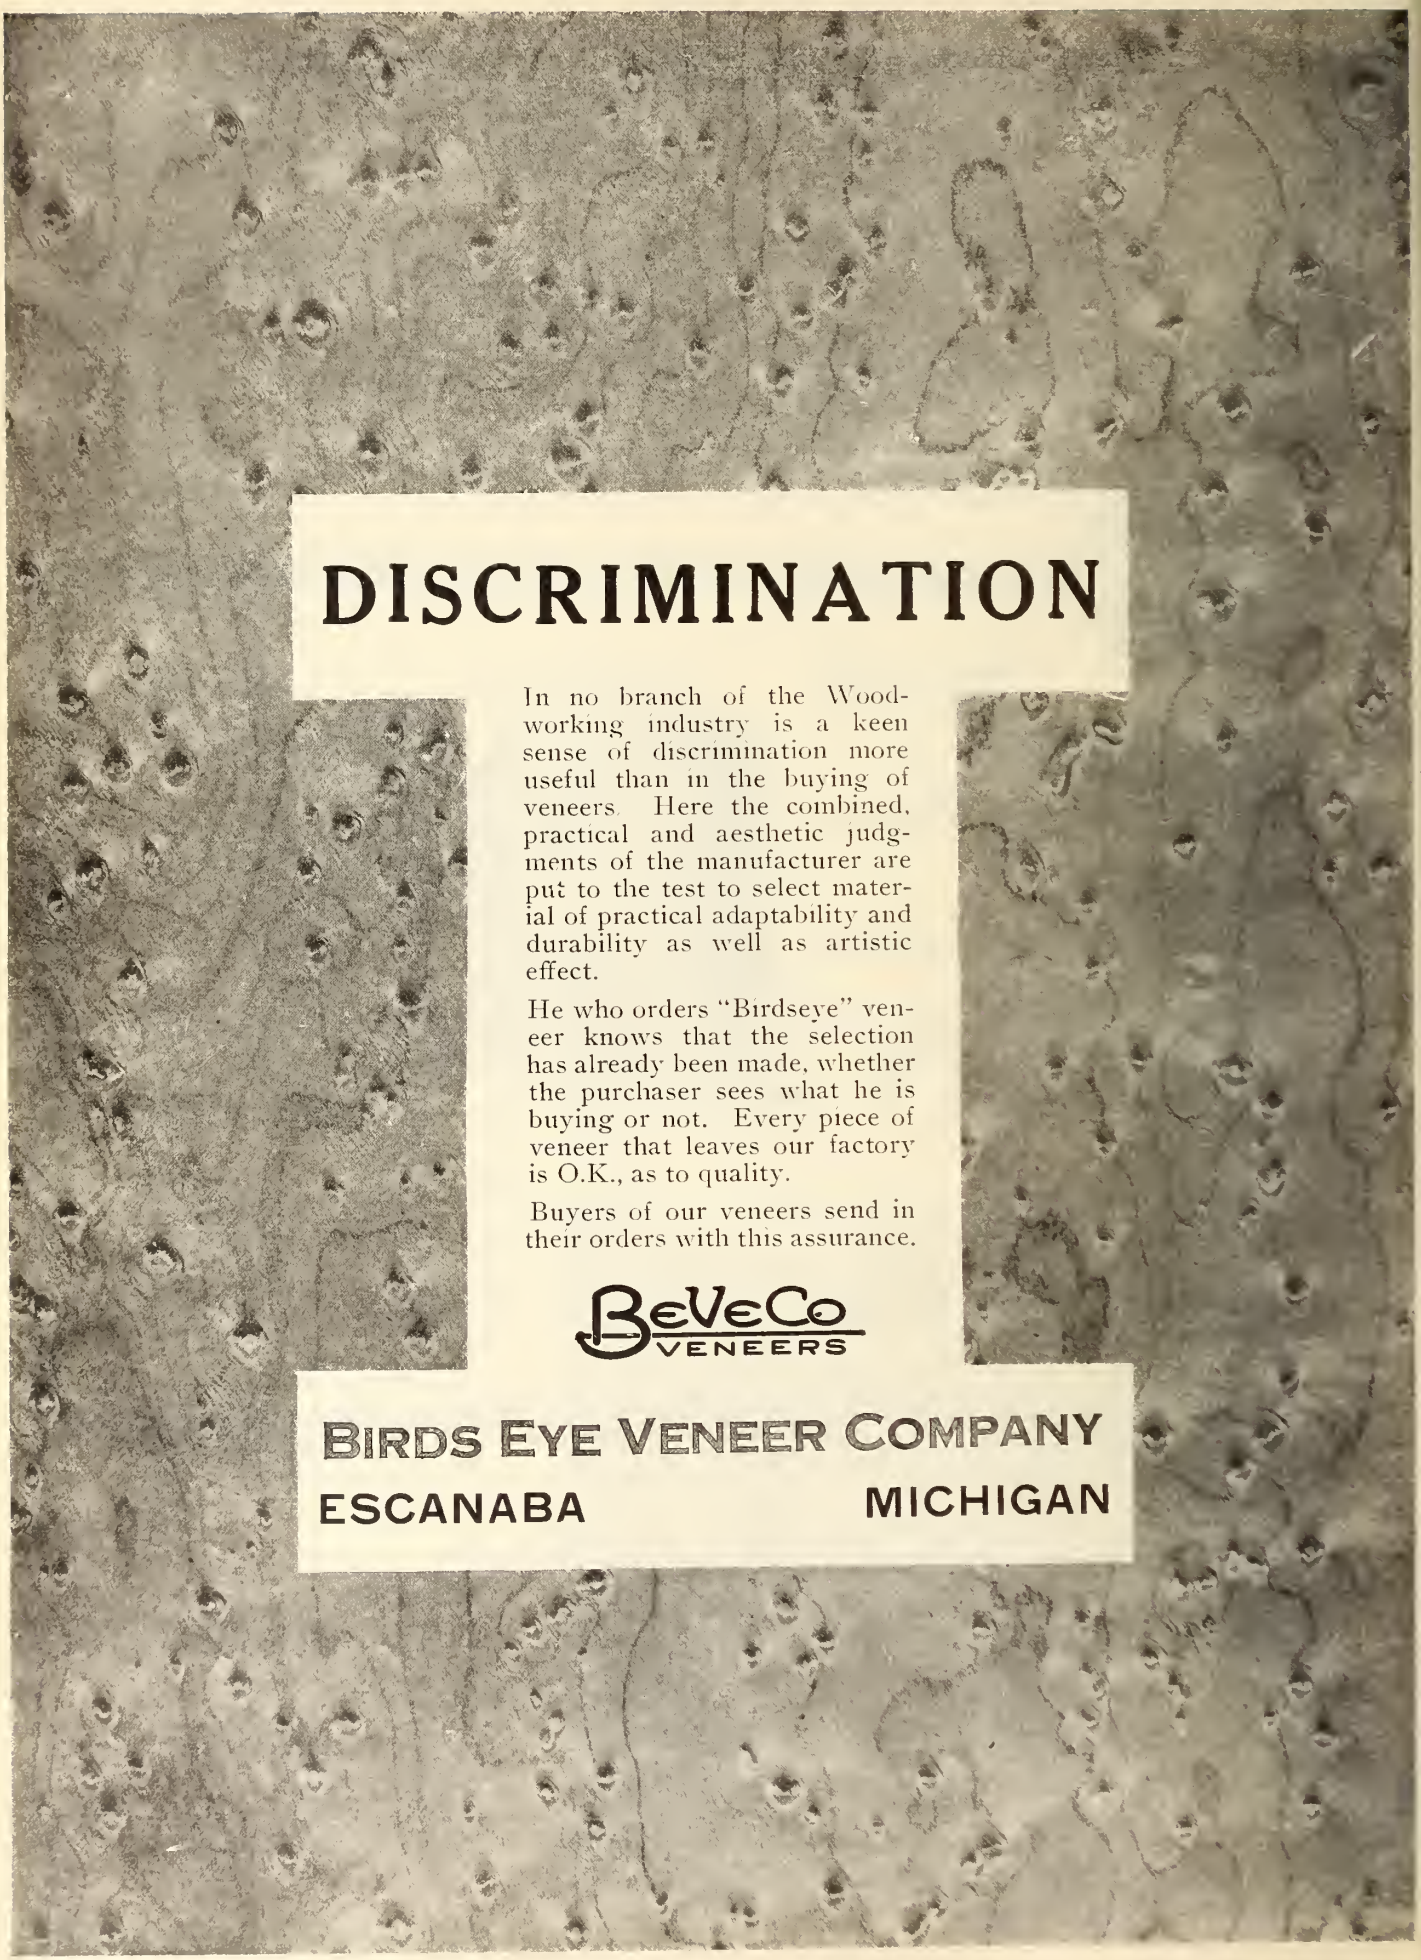
Here's a Suggestion

Do you ever try keeping a file of your back copies of the "Canadian Woodworker"? Try it. Start with this issue. There are many articles that are worth keeping, as they offer valuable suggestions that will help you in your business.



DISCRIMINATION
In no branch of the Woodworking industry is a keen sense of discrimination more useful than in the buying of veneers. Here the combined, practical and aesthetic judgments of the manufacturer are put to the test to select material of practical adaptability and durability as well as artistic effect.
He who orders "Birdseye" veneer knows that the selection has already been made, whether the purchaser sees what he is buying or not. Every piece of veneer that leaves our factory is O.K., as to quality.
Buyers of our veneers send in their orders with this assurance.

Veneers and Panels

"He Profits Most Who Serves Best"

J. T. Horne Suggests Rotarians' Motto for Veneer and Panel Industry—Report of Annual Meeting National Veneer and Panel Manufacturers' Association—Believe Industry Is Facing Better Business

Business of considerable importance was transacted at the annual gathering of the National Veneer and Panel Manufacturers' Association, held recently in Chicago. Probably the outstanding feature was the proposal to effect a merger with the Plywood Manufacturers' Association. It is probable that definite action will be taken when the plywood manufacturers meet next March. In the meantime a special committee will get in touch with the Plywood Association and see what can be accomplished.

H. Brooke Sale, Fort Wayne, Ind.

Another important piece of business was in connection with the $50,000 advertising campaign, planned to acquaint the public with the merit and value of veneered products. It will be remembered that this campaign was undertaken jointly by the two associations, each agreeing to bear half the expense. To date the Plywood Manufacturers' Association has raised $15,000, while nothing has been done by the National body. H. Brooke Sale, the newly-elected president, declined to accept office unless the members of the National Association were prepared to live up to their obligations. Mr. Sale did not feel that it would be just to himself to accept the leadership of an organization which was not living up to its obligations. Upon the motion of Thomas D. Perry, of the Grand Rapids Veneer Works, the negotiating committee, mentioned above, was authorized to collect the funds for this campaign.

Advertising Campaign Receives Attention

The advertising campaign was discussed in detail. G. O. Worland, of the Evansville Veneer Company, reported that all the preliminary work had been completed and that everything was in readiness for the main effort. He outlined the necessity for immediate action so that the value of the publicity given by the trade press should not be lost.

Wm. Clendenin, of the Conover-Mooney Company, Chicago, who are handling the advertising, gave an outline of what had been done and what it was proposed to accomplish. He urged that the display advertising through the trade, magazine and daily press, should be undertaken without delay. He was followed by Mr. Mooney, of the same organization, in a strong appeal for immediate action.

The freight committee made a report on its action for lower, more equitable rates on veneers. The case is to be continued in Chicago shortly, before Examiner Cassidy of the Interstate Commerce Commission, when a favorable verdict is expected. There does not seem to be any logical reason why the railroads should charge a premium to haul fancy veneers and plywood when the rates on all other commodities are based on weight instead of value.

The officers elected for the ensuing year are as follows:—H. Brooke Sale, Hoffman Brothers Co., Fort Wayne, Ind., president; C. B. Allen, Allen-Eaton Panel Company, Memphis, Tenn., first vice-president; E. I. Ross, Medford Veneer Company, Medford, Wis., second vice-president; Earl Morrison, Jamestown Panel Co., Inc., Jamestown, N. Y., third vice-president; E. H. Defebaugh, Chicago, treasurer; Howard S. Young, Indianapolis, Ind., secretary.

President's Opening Address

The retiring president, J. T. Horne, in his annual address, outlined the situation which the veneer and panel industry is facing and expressed the opinion that 1922 gave promise of better things. His address follows:—

At our annual meeting one year ago to-day we were all very much depressed as to the business situation and, in fact, there was very little to encourage us. At our semi-annual meeting in July conditions were even worse. Orders which we had on our books were cancelled, and to get new business was almost out of the question. It is true that some of our members and other mills who were not members of the association made prices that were below cost in many instances and did manage to keep their plants in partial operation at least, but the majority of the veneer and panel plants of the country were either closed down entirely or running with a very small force, and I am sure that we are all glad that the

year 1921, so far as business conditions are concerned, has passed into history.

While it is a pleasure to do business when we know that after we have taken an order it will be accepted when shipped, it is not a very comfortable feeling when we are always wondering whether or not the order will be cancelled by the time we are able to produce it. It has been impossible to know from week to week just what move to make, and as a whole the year has been a very unsatisfactory one.

But I am glad to be able to say to-day to you that in my opinion—and I am basing this opinion on the judgment of men of large affairs—we have seen the worst of the business depression and that we are now headed toward a much brighter year in 1922. There have been quite a few important happenings that have taken place during the year that are now having a good effect upon world business and will still have more effect as progress is made in putting into practice the real things that are now in the making.

Financial Situation Improving

The financial situation, which is a large factor at all times, we all well know is vastly improved. Discount rates have been lowered, the Federal Reserve Bank reserve is vastly improved, solvent concerns are able to finance themselves, and as a whole, so far as the United States is concerned, our financial structure is on a sound footing. A great many more factories in our line, as well as in many other lines, are in operation now than were a few months ago, some of them having orders as much as four or five months ahead. Labor is much more fully employed; wages are in some lines overpaid, especially the railroad labor, while in other lines labor is underpaid.

The labor question with us is one that should have at all times our very best thought, and we should try, so far as is possible, to pay our help in proportion to the cost of commodities which labor must buy, always keeping in mind the fact that labor not only produces practically all that is needed for the welfare of humanity, but that the money paid labor and the money of the farmer constitutes the larger part if our buying power in this country, as well as the world.

While these things that have been mentioned sound optimistic, there of course is another side to the situation, and one of the greatest reasons why we can not hope to get back to a large and settled business basis quickly is the financial situation in the Old Country. Their exchange is of little value, and badly as they may wish to trade with us, it is simply impossible for them to do so until their financial position is strengthened, and this can only be when they receive further financial assistance that is necessary to put them in a position to do business, and this assistance can only come from one country, and that country is ours.

Another fundamental difficulty that we must face is the difference between the price of farm products and all raw materials and the price of manufactured goods. As we have already stated, the farmer is one of our best customers, and so long as his products sell at a price below the cost of production, just so long will business be curtailed just in that proportion, and there can be no stable regular trade while this condition exists. Congress talks, and let us hope will put into operation some plan whereby the farmer may be relieved and thereby strengthen the situation.

Law of Supply and Demand

The labor unions would have us believe that the law of supply and demand has ceased to function. Nothing is further from the truth. It is working to-day in the labor world, always has worked and always will, and in our opinion is one of the greatest causes of the recent increased demand for veneer and panels. A very large per cent of the veneer and panel consumers were stocked with high priced goods and have been gradually working this stock down until they could see their way clear to place some orders, and if we are careful as sellers of veneer and panels and use our heads and do not attempt to push the price of our products to an unreasonable price, in our opinion, we will have for the next six months a healthy profitable business; but should we lose our heads, as we did in the past, the increased demand which has been noticeable for the past few weeks will stop just as suddenly as it came.

I trust that to-day in this meeting we may be absolutely frank with each other, talk over the situations with each other and go home with our minds made up to do, so far as is possible, our full duty as we may see it, not only in our own business, but in all the ways we can to help put the entire business world on its feet again, always bearing in mind the golden rule in business and ever keeping for our motto that of the Rotary Clubs of the World, "He profits most who serves best."

Average Spread of Glues

In determining the cost of any article the glue cost must not be overlooked for on certain classes of work, especially those calling for considerable quantities of plywood or veneers, it is an item of no small importance. The average glue spread for different kinds of glue, may be determined by observing how far the glue goes on various classes of work. Such knowledge, when properly tabulated, would be found very handy.

The following reports show the results of tests made by four manufacturers. While these figures may not be applicable to all plants or to all woods, they give an idea of what constitutes an average spread.

Factory "A"

"Our spread of vegetable glue is 41 feet, while hide glue runs 38 feet. This spread varies, depending on the core or center stock, Chestnut taking the greater spread, Pine a little less and hardwood still less, but this is the average. Of course, the vegetable glue is cold, while the hide glue is hot. We use roller spreaders."

Factory "B"

"Using a vegetable glue applied hot with a roller glue spreader on Western Pine and Spruce cores, we spread 38 square feet per pound of glue."

Factory "C"

"Our records show that we can spread 45 square feet from one pound of vegetable glue, while hide glue runs 40 square feet. We use roller spreaders for this work."

Factory "D"

"While we do not have any record of the total number of square feet one pound of glue will cover on panel work and the like, we can give you our experience for glue joining for width. Using a ground or a flake glue applied hot by hand brush on White Pine, Yellow Pine, Oak or Birch, one pound of glue will run 200 lineal feet of 1⅛" glue joint, or one pound will run 164 feet of 1⅜" glue joint."

	Spread per pound of glue	
	Hide Glue	Vegetable Glue
Applied to face surfaces		
Factory "A" Roller Spread	38 sq. ft.	41 sq. ft.
" "B" " "	38 "	
" "C" " "	40 "	45 "
" Total	116 "	86 "
" Average	38-2/3 sq. ft.	43 sq. ft.
Applied to edges	**Size**	
Factory "D" Hand Brushed	1-1/8"	200 lin. ft.
" "D" " "	1-3/8"	164 "

Prefer Plywood to Terms Veneered or Built-up

Plywood Manufacturers Endorse Former Term—Hope to Extend Plywood Cost Knowledge to Furniture Industry—Trend of Plywood Prices

The Plywood Manufacturers' Association held one of their quarterly meetings at Chicago, December 14th. A number of interesting questions were up for discussion, including cost methods, the publicity campaign, the new plywood glue, furniture definitions and the adoption of an association trade mark for use of members. A committee was appointed to consider uniting the veneer and panel manufacturing industry under one association by effecting a merger with the National Veneer and Panel Manufacturers' Association.

An outstanding feature of the meeting was the address of the President, Thomas D. Perry, of the Grand Rapids Veneer Works. Mr. Perry ably outlined the problems confronting the industry and various phases of the working with which the association is confronted. His address is as follows:—

Your president recently attended two meetings of the National Council of Furniture Associations at which several topics of interest to our members were under discussion. The September meeting at Hot Springs gave opportunity to explain at some length the status of our association glue development in which a keen interest was evidenced. At this meeting attention was also given to the designations or descriptions of different grades or constructions of furniture. Your president took the position that in the group entitled "Genuine", and indicated to include both solid and veneered woods, it would be advisable to make a two-line descriptive title, i. e.,

(GENUINE)
(Solid & Plywood)

He felt that long descriptions would seldom be read or remembered, but that the word "Genuine" needed something to strengthen it.

Uniform Descriptive Terms

The same topic was under discussion at a meeting held in Cleveland by the Associated Advertising Clubs at which the conclusion reached indicated the use of the word "Built-up", for one of the grades. It was impossible to attend this meeting, but our preference for the word "Plywood" was made clear to their secretary.

At the New York Council meeting in December still further consideration was given to the grade designation and an opportunity was given our association to again register its opinion for the use of the term "Plywood", because of its correctness, its general use and the difficulty and confusion attending the use of such terms as "veneered", "built-up"", "compound-wood", "multiple ply", etc. Our association must vigorously maintain its position on this subject, so that a proper conception may be developed in the minds of the public that "plywood" means several sheets of thin wood glued together, to enhance the beauty and increase the strength.

Plywood Price Deflation

At the Council meeting at Hot Springs, Cost Counsel, W. H. Coye, exhibited charts showing the price range of component materials entering into case goods dining tables, and chairs. Plywood was given a line in the first two charts, which nearly corresponded to the lumber line. In September the lumber line showed greater reductions than the plywood line but the last four months have given the lumber line an upward tendency while the plywood has continued its downward course.

The relentless process of price deflation has gone rather heavily on plywood manufacturers, and little interest is evidenced by them in the new tax legislation and the raising of the corporation income tax from 10 per cent to 12½ per cent. On every hand is a realization that costs must get down to normal, but no one has discovered any sure guide to the location of normalcy. The market on 13 16 in. 5-ply figured tops (I. G. S.) averages around 25 cents and on ¼ in. 3-ply birch panels (I. G. S.) around 9 cents, but the variations in vigorous competition have run 33 per cent under and the quality grades are securing 20 per cent more than the average. With unstable raw material prices and under-production, it is well nigh impossible to state whether the above averages will enable the manufacturer to get out whole or not. Many shrewd buyers are stocking up heavily on lumber, veneers and plywood, and the two former items have taken a distinct upward turn.

This is not a time to cast aside costing methods as useless, but to keep them in running order so that they may completely function again as the volume of production begins to stabilize the overheads. Foresight, judgment and nerve will carry us through this period and the worst is apparently behind us.

Work of the Committees

The reports submitted by the different committees indicate faithful work and are worth careful consideration. The Traffic Committee has made excellent progress in the hearing before the Interstate Commerce Commission examiner at Louisville on Docket No. 8131. The Glue situation is assuming more definite shape and the committee report indicates that experience is shaping a successful and satisfactory policy for a good glue at a reasonable price. Conditions have not been favorable for making progress in the matter of Grading Rules. The Publicity or Trade Promotion Committee has had a difficult problem in the failure of the National Veneer & Panel Association to meet its half of the assessment as agreed upon at their June meeting. Some means must be devised to "put over" the publicity program which has been so admirably started, and to which our Plywood members have definitely pledged their assessments.

Cost Engineer Potter has now finished the five sections of his "Costing Principles", to be revised and bound in a single book at some future date. The completion of this work puts us in a position to advocate its effective use in fields where it will be benficial to the plywood industry as a whole. There are three

ALGOMA *the Better* Plywood

Circassian Walnut! It's been like opening a Captain Kidd treasure chest to cut these rare logs at Algoma—like lifting the lid on precious gems to see the surpassing beauty of graining opened before our eyes.

Frankly, these logs have exceeded even our hopes and expectations—they will surpass yours. Circassian Walnut has been off the market since 1914. However, the quality of the logs we are now cutting amply rewards us for the seven long years we have waited.

We take justifiable pride in having secured this shipment from far Caucasus—and the finest skill of our workmen is called upon to bring out the fullest matching possibilities of this supreme wood.

Circassian Walnut panels—Algoma made—are ready for you in any size you wish to order.

ALGOMA PANEL COMPANY, *Algoma, Wis.*

Prefer Plywood to Terms Veneered or Built-up

(Continued from page 78)

distinct opportunities now apparent: First, the plywood manufacturer who is still guessing at his costs. It is a fact that only about one plywood member in eight knows his costs accurately. Second, the veneer producer who knows even less of his actual costs than the plywood man. Mr. Potter's outlines include the principles of costing for rotary, sawn and sliced veneers. When veneer makers begin to realize and use even rudimentary costs, there will come a stabilization of prices that will benefit all. Third, the furniture manufacturer. Rare indeed is the maker of furniture who apportions to his plywood assembling department the proper overhead burdens that make his internal cost really comparable with that of the outside plywood specialist.

Our cost engineer's work has been thorough and has received commendation wherever it has been studied. Our job is to capitalize this investment in a large way. We should begin to do this in our own organization by putting the principles and practices which have been set forth in the cost manual into actual practice in as many of our member plants as possible. We should also wage a vigorous campaign for accurate and uniform costing, not only on the part of these who supply us with raw material, but on the part of those who use our product as well. Unless we do this, and educate woodworkers along these lines, we are failing to earn a suitable revenue from our investment.

The task is no small problem and is worthy of our mettle, but ways and means must be devised for such a campaign. The three projects can be carried along simultaneously and the quality of the service may be made such that everyone in the three classes enumerated will want the results, and will not be satisfied until he gets them.

Need of Protected Trade Mark

A trade mark has been under consideration for the Association for some little time, and there is a need for authorizing the use of an approved label on our standard glue, and your president believes that a decision on this point should be made. The design shown is submitted as a suggestion. The form is reasonably simple, the date of the original organization of the Panel Club with the re-organization of our present Association appearing with the initials. In order to legally protect this it should be properly copyrighted in the United States patent office.

The necessity for adopting standard names or titles for the approved grade or grades of glue and the authorizing of the form in which these names shall be used will come up in the immediate future and it would be your president's suggestion that this question of nomenclature and designation be referred to the glue trustee with full power to act, notifying the members promptly of decisions reached.

Your president feels deeply the degree of co-operation extended to him individually and collectively by our officers and members in the various activities of our Association. The election of new officers is due at our next meeting in March—three months hence—and I am firmly convinced that the best interests of the Association will be served by limiting the term of any resident to not over three years. Perhaps past presidents should be made ex-officio members of the Executive Committee to help in correlating the work.

Afraid of a Run-away Market

Practically every hardwood lumber manufacturer in the various producing centres has the fear of what they term a "run-away" market. They know that if there is a sudden demand on the manufacturers for lumber, on account of the shortage, prices are going to jump way out of proportion to what they should be, which will, of course, be governed by the laws of supply and demand. Just as sure as the prices do run up high, it is going to affect general buying and there will be a worse slump than we had in 1921. If the lumber buyers would only place their orders for their legitimate requirements now and gradually, it would not have a bad effect on the market. The lumber manufacturers are doing their best to get stocks of dry hardwoods on hand but with the rainy season almost upon them in the south and very few available logs, it is a hard proposition.

Information and Inquiries

You are cordially invited to make use of this department

Directions for Burnishing Picture Frames

Wilmington, Delaware,
Dec. 14th, 1921.

Editor, "Canadian Woodworker."

On the information page of the October issue of the "Canadian Woodworker and Furniture Manufacturer," there appeared a request for information on bronzing and burnishing picture frames. We are outlining a process as used by one manufacturer. This is a proven method and if the directions are followed carefully, good results are assured. You are at liberty to publish this information.

Sincerely yours,
Celluloid Zapon Co.

1—Sand the frame until it is smooth.

2—Mix up a small quantity of fine Gilders Whiting with a very weak solution of hot glue and water. Apply two coats. The glue solution must be very weak otherwise it will chip and crack off from the frame.

3—Sand this down after it is dry with a very fine sand paper, until it becomes smooth.

4—Take Red or Blue burnish size, mix with it a very weak solution of hot glue and water. Apply two coats. If this appears rough after it is dry, rub lightly with fine sand paper.

5—Take burnish gold bronze, mix a small amount of alcohol with it into a paste form, then add a weak solution of hot glue and water. Stir well while doing it. Always apply hot if you want good results. The best way is to keep the cup in hot water—that keeps it from chilling. Give two coats of bronze, letting first coat dry before applying the second.

6—Let dry for about 5 hours then rub lightly with the agate burnisher, which must be prepared by rubbing the agate on a piece of leather with emery and crude oil until the glassy finish on it is removed. Then you are assured of good results.

7—Apply a coat of H. G. Lacquer on top of the bronze and frame is complete. If you want to tone down the bronze to make it look antique, apply a thin coat of Japan colors, whatever shade is desired. Burnt umber is largely used. Thin with benzine, apply to the frame and wipe off the high lights.

Rosewood Veneer Wanted

St. Thomas, Ont.
Dec. 19th 1921.

Editor, "Canadian Woodworker."

Will you kindly inform us where we could secure some rosewood veneer, also wooden wheels for tea wagons?

Sincerely yours,
G. Webber.

Rosewood veneer is rather scarce at the present time. Would suggest you write the Toronto Veneer Co., Toronto, as they sometimes have a stock of rosewood on hand. Wooden wheels for tea wagons do not seem to be on the market. As far as we know each manufacturer of these wagons makes his own wheels. The Faultless Caster Co., of Evansville, Ind., make a metal swivel wheel with a felt tire, which is used on tea wagons, and it is possible that these might suit your requirements. You might try George Bilton, Sackville Place, Toronto. He specializes in tea wagons and might be willing to supply you with wheels of his own manufacture.

Who Makes Battery Separators?

Indianapolis, Ind.
Dec. 23rd, 1921.

Editor, "Canadian Woodworker."

In the "Canadian Woodworker" of August you published an article dealing with wood separators in the last paragraph of which it was stated that at the present time at least two companies are working on this proposition. Would you kindly favor me with the names of these two firms and also any other Canadian manufacturers making these separators?

Yours very truly,
E. P. Borcherding.

The B. C. Separator Mfg. Co., New Westminster, B. C., and the O. Spanner & Co., Elm St., Toronto, are the two firms to which reference was made in this article. We believe that Lyons Bros., 16 Plymouth St., Toronto, manufacturers of battery boxes, are preparing to make separators.

Equipment to Make Wood Heels

60 St. Urbain St. Montreal, Que.
Dec. 29th, 1921.

Editor, "Canadian Woodworker."

What machinery would you advise as best adapted to the manufacture of wooden heels for ladies' shoes? If possible, kindly give description of such machinery with approximate cost and also state where the equipment may be obtained.

Sincerely yours,
Montreal Cabinet Co.

Wood heels are produced by a number of special shaper operations. This requires special equipment. Would suggest that you get in touch with the Goodspeed Machinery Co., of Winchendon, Mass., as they are manufacturing a line of modern heel-making equipment.

Lamp Shades Wanted

Brantford, Ont.,
Grandview P. O., Dec. 15th, 1921.

Editor, "Canadian Woodworker."

Will you kindly give me the names of manufacturers of lamp shades? I am making a line of lamps and am desirous of securing suitable shades.

Sincerely yours,
L. Brown.

It is just possible that the Baetz Bros. Specialty Co., Limited, Kitchener, Ont., or G. L. Irish, Queen St., Toronto, can supply you with your requirements in this line.

Canadian Plywood Wanted

A Manchester firm is open to purchase large quantities of Canadian plywood if prices and quality are right. Inquiry 3722.

In the Market for Staves

A London firm with connections in the Argentine are in the market for oak staves for 200 litre, wine barrels, weight of barrel to be 27 kilogrammes. Inquiry 3724.

We are prepared to quote attractive prices on the above, and if required, can kiln-dry and dress any of this to your order.

We are prepared to quote on anything in Hardwoods for shipment direct from the mills in car lots, and solicit your inquiries. We are cutting Gum, Chestnut, Walnut and Mexican Mahogany, and have dry stocks at Jackson, Tenn. and Indianapolis, Ind.

The Lumber Market

Domestic Woods

The usual January lull is being experienced in local lumber centres. True, a certain amount of stock is moving and a satisfactory volume of inquiries are being received but little new business is being placed. Stock-taking and buying do not seem to go hand-in-hand, and this is stock-taking time. Logging conditions are good and if things were anything like normal, a large log output would be expected. Owing to the unsettled condition of the lumber market, the majority of lumbermen are acting with extreme caution. It is estimated that the cut of hardwood for the winter season will be about 50 per cent of that brought out last year, while the cut of softwoods may run 60 to 70 per cent of last season. This will work against the accumulation of any large stocks of lumber during 1922.

In softwoods hemlock is holding very firm. Many, who have quantities of this wood in stock, are convinced that its value will increase within the next month or two, and as a result are inclined to hold out for their price. White pine stocks are light with the exception of mill culls. No. 1 mill culls have been moving recently, and as soon as the box industry opens up, it is anticipated that No. 2 culls will rapidly disappear. Some of the better grades of pine are decidedly scarce. Spruce is weak with little or no demand.

Hardwoods are showing up better. Birch and maple are being sought by furniture and flooring manufacturers. The hardwood branch of the industry is confronted with a surplus of No. 2 and 3 common, while firsts and seconds and selects are scarce. It is probable that the price of the upper grades will show signs of stiffening. Many who have better-grade hardwoods in stock, are holding out for a fair price. On the whole there seems to be less disposition on the part of buyers to haggle over prices. They seem to have realized that lumber values have touched bottom and their concern is to secure the stock and grades they require.

Imported Woods

The status quo holds in the various American hardwood circles. The past few weeks have not witnessed any material change in the situation. Hardwood lumber values are firm at the high points reached during the past two months, and as business opens up and develops it will not be surprising if other increases are noticed. There is a fair volume of lumber moving though buying is light at this time of writing. Reports from different centres indicate that inquiries continue to come in at a satisfactory rate. It is thought that as soon as the inventory period is past, many buyers will come in in earnest with a corresponding improvement in market conditions. Production has been on the increase though it is still below shipments, which means that stocks are being still further depleted. Conditions in some of the logging centres are hindering operations so that the input of logs to many mills is light.

The furniture markets which are being held at various centres are, judging from early reports, proving up to the expectations, and in all probability a nice volume of business will result. If this proves correct, it cannot help but have a strengthening effect on the lumber situation, as it will bring the furniture buyers into the market in force. As has been emphasized in these columns on more than one occasion, any marked increase in demand, even on the part of any one industry, cannot help but be reflected by an upward movement in prices. In this connection the automobile industry is exhibiting signs of life and may soon become an important factor in the field.

Memphis, Tenn. Reports from this district suggest that from the inquiries and orders being received business will have a turn for the better during the next few weeks. One feature of the market is the growing number of export inquiries. All prices are holding firm and lumber operators are of the opinion that still further advances are about due. Weather conditions are interfering with logging, and as a result all efforts to increase production and build up well-assorted stocks are not meeting with much success. The first six months of the year are expected to witness an active call with stiffening prices.

Louisville, Ky. A slowness prevails in this centre although inquiries, which have every appearance of being bona fide, are numerous. The automobile manufacturers are taking note of conditions, and it is expected that a certain amount of buying will be done by them in the near future. For this reason ash is considered good stock and prices on this wood are very firm. Such woods as walnut, gum and oak are in fair demand although they are not moving as freely as they did a short while ago. FAS. prices at Louisville, are,—plain red gum 4/4 $110.00; quartered red gum, 4/4, $115.00; sap gum 4/4, $50.00; ash, 4/4, $85.00; quartered oak, 4/4, $140.00; plain oak, 4/4, $110.00; poplar, 4/4, $110.00; common oak, plain, $55.00.

Buffalo, N. Y. Wholesale dealers in this centre are anticipating an early revival of buying though at the moment things are very dull. As this is usual during the early part of the year, an optimistic attitude is everywhere visible. The prospects for business are considered to be much better than in January 1921, as values are on a more stable basis. It is thought that slight advances are probable.

Evansville, Ind. During the past ten days trade with the lumber manufacturers of southern Indiana, southern Illinois and western and northern Kentucky has been sluggish. This is supposed to be the usual new year lull. Heavy rains and floods have seriously interfered with logging in the southern States, with the result that manufacturers are finding it very difficult to increase production. There is a considerable degree of optimism in these districts as it is felt that 1922 will witness a revival of the lumber industry on something like a normal scale.

One of the chief duties of the Sales Manager is to give his men constructive help in their work. If a sales manager cannot help his salesmen make sales, what is he for? I have three sales managers in my business, one for each division. Each of them when he visits an agency helps the man there to make sales. If he could not he would not be the sales manager. I do not mean for him to go out and canvass the stores, I mean he is everlastingly gathering material and thinking, so that he has something to take out with him and say "Put this down in your note book."

Walnut, Quartered White Oak and Mahogany Veneers and Lumber

News of the Trade

The sash and door factory of W. Chicoine, Rigaud, Que., was destroyed by fire.

Davies & Baskerville, Swift Current, Sask., have opened up a general upholstering shop.

Alex. Watson has opened an upholstering shop at 872 St. Catherine St West, Montreal.

The Laidlaw Bale Tie Co., of Hamilton, Ont., are distributing an attractive and useful office calendar.

Allard & Desnoyers Co., Montreal, who operated a sash and door factory, have dissolved partnership.

Thomas Findley, Toronto, former president of the Massey-Harris Co., Ltd., died recently at his home in that city.

The basket manufacturing business conducted at Thessalon, Ont., by J. E. Asam, has been taken over by J. E. Asam & Co.

R. Magwood, of the F. E. Coombe Furniture Co., Limited, Kincardine, Ont., was returned reeve in the elections recently held.

The Northern Varnish Co., Limited, Owen Sound, Ont., are sending an unusually attractive calendar to their friends in the trade.

The "Canadian Woodworker" is in receipt of an attractive greeting card from the Barr-Holaday Lumber Co., Greenfield, Ohio.

A. E. Malcolm, manager of the Andrew Malcolm Furniture Co., Limited, Listowel, Ont., was recently re-elected mayor of that town.

Chas. Baetz, of the Baetz Bros. Furniture Co., Limited, Kitchener, Ont., was re-elected alderman at the recent municipal elections.

The Perkins Glue Co., Lansdale, Pa., remembered their friends in the industry this year, with an attractive and useful solid leather billfold.

W. L. Kramer, eastern district sales manager of the Marietta Paint & Color Co., Marietta, Ohio, recently passed away at Williamsport, Pa.

The planing mill of Morin & Frere, Cap De La Madeleine, P.Q., was recently destroyed by fire. Loss $15,000. Owners plan on rebuilding.

J. E. Gardner, Galt, Ont., who is a member of the firm of P. W. Gardiner & Son, door manufacturers, has been re-elected an alderman for 1922.

Heintzman & Co., Limited, Toronto, manufactnrers of high grade pianos, recently installed a C.M.C., No. 6111, straight edging and jointing saw.

Artrola Co., Montreal, gramophone manufacturers were recently registered with Omer Laganiere and Arthur Levesque as the company incorporators.

C. Erb and J. Heinbuch have acquired the Baptist Church at Tavistock, Ont., and contemplate changing it into a planing mill and sash and door factory.

John C. Hackson, 398 Lincoln Road, Walkerville, Ont., is building a small addition to his plant and is in the market for a band saw and an arm sander.

The Valley City Seating Co., Limited, Dundas, Ont., recently shipped a handsomely-carved quartered oak altar to the St. Peter's Church, Tecumseh, Mich.

The Rose Furniture Polish Company, Quebec, P. Q., have been granted a provinc'al charter to manufacture and deal in all kinds of oils, varnishes and furniture polishes. Capital $49,000. T. F. Bourque and J. G. Bourque, both of Quebec City are two of the incorporators.

The Williamson Veneer Co., Baltimore, Md., remembered their customers with a very attractive greeting card wishing them health and prosperity during 1922.

R. Truax, Son & Co., Walkerton, Ont., recently completed a new sash and door factory and planing mill. The new building is 310x60 feet, of brick construction.

A new box factory is being equipped at Laidlaw, B. C., where a Mr. McKay and associates have built a mill and are installing modern box-manufacturing equipment.

The Fairbank Lumber & Coal Co., Fairbank, Ont., are building a two-storey planing mill, 50 x 60 feet, and are in the market for the necessary machinery and equipment.

J. H. McDonald, manager of the B. C. Manufacturing Co., Limited, New Westminster, B. C., managed to secure several large orders for boxes recently while on a business trip to Eastern Canada.

Samuel Pannabecker of Hespeler, Int., recently d'ed at the age of 77 years. The deceased was a well known resident of that town where he was engaged in the manufacture of carriages for many years.

Meaford Mfg. Co., Limited, Meaford, Ont., recently shipped seven carloads of furniture to the Robert Simpson Co., Toronto. This is one of the largest shipments of furniture that has left Meaford for some time.

The Gerrard Wire Tying Machine Co., Limited, Hamilton, Ont., had one of their wire tying machines on view at the annual convention of the Canadian Lumbermen's Association, which was held at Toronto recently.

Wm. H. Bradley recently passed away at his home at Nashwaak Village, N. B. Mr. Bradley was widely known, having been connected with various enterprises, included among which are a carriage factory and an axe factory.

The ratepayers of Kincardine, Ont., recently carried bylaws granting an extention of tax exemption to the Andrew Malcolm Furniture Co., Limited, and the F. E. Coombe Furniture Co., Limited, for a further period of ten years.

The Canada Car & Foundry Co., Montreal, recently secured an order for repairing 2,000 cars for Canadian National Railways. The work will be divided between the Fort William works and the Montreal and Amherst plants.

The annual meeting of the Canadian Broom Manufacturers' Association was held at the Queen's hotel Toronto, on December 29th. H. H. Stevens of Port Elgin, Ont., was re-elected president and W. I. Thomas, Ingersoll, Ont., secretary.

Palm Grip Rim Co., Limited, Montreal, has been granted a federal charter to manufacture and deal in carriages, trucks, boats and other vehicles. Capital $100,000. Two of the incorporators are A. R. Plimsoll, and M. T. Burke, both of Montreal.

A federal charter has been granted to the Dominion Wood Specialties, with a capital stock of $50,000 and headquarters in Montreal. The company is enpowered to manufacture and deal in lumber, wood and wood products of all kinds, and all articles of which

Which?

WHAT a difference there is between these two systems. The one always suggesting the possibilities of errors—the other printed in clearcut, legible type, unchangeable and always accurate; the one still in use by some firms, the latter adopted as a standard method of timekeeping by those who realize the advantages of knowing at a glance the amount of time they have purchased.

The loss of time which is encouraged by the former system would, in a short time, pay for an "INTERNATIONAL". Let us prove it.

We would like to have an opportunity to demonstrate to you that International Time Recorders and International Job Time Recorders are indispensable where it is desirable to have an accurate check of purchased labour at all times. May we send our literature, or have one of our representatives call?

Inaccurate, smudgy, changeable, pencil records

LONDON, 489 Richmond St. WALKERVILLE, 44 Lincoln Rd. WINNIPEG, 227 McDermott Ave. VANCOUVER, 230 Cambie St. SASKATOON, 254 Third Ave. S.

Also manufacturers of International Dayton Scales and International Electric Tabulators

wood forms a part. Among the incorporators are John F. Forman, Ernest Lindelius, Montreal, and Chas. H. Ancrum, of Westmount.

George Tilson, Sr., Tillsonburg, Ont., recently passed away in his 61st year. Mr. Tilson was the founder of Tillsonburg. He was actively connected with the Tilson Milling Co., which operated a planing mill in connection with their other activities.

The Pronvost Universal Wheel Co., Limited, Montreal, was recently granted a federal charter to manufacture all kinds of wooden wheels. Capital $750,000. Two of the incorporators are J. D. Kennedy, broker, and C. B. Reilly, barrister, both of Montreal.

La Cie Industrielle de Trois-Pistoles, Trois Pistoles, Quebec, have been incorporated to manufacture and deal in sash and doors and other wooden building materials. Capital $15,000. J. Belzil and J. Larrivee, both of Trois-Pistoles, Quebec, are the incorporators.

P. W. Gardiner & Sons, Limited, Galt, Ont., have been incorporated to take over the business known as P. W. Gardiner & Son, and to manufacture and deal in lumber products, chiefly doors. Capital $500,000. P. W. Gardiner and J. E. Gardiner are two of the incorporators.

E. C. Atkins & Co., Hamilton, Ont., report that they have made a substantial reduction in the price of their Sterling Quality saws, both in the territories covered by their Eastern travellers, and in British Columbia. In the latter place, they have a very complete shop and a large stock, at 109 Powell St., Vancouver.

W. W. Hill, 15 Nickle Ave., Mount Dennis, Ont., is erecting a small woodworking shop. He proposes to manufacture a patent combination child's crib and store and office fixtures. For the present he has put in a combination Elliott woodworker, and in the near future proposes adding a band saw, shaper and planer.

Snyders, Limited, Waterloo, Ont., have been authorized by supplementary letters patent to acquire the Snyder Bros.' Upholstering Company, Limited, and to manufacture and deal in all kinds of upholstery goods. Capital $600,000. H. M. Snyder and A. H. Snyder, manufacturers, are among the incorporators.

The employees of the Boeckh Co., Limited, Toronto, manufacturers of brushes, recently showed their appreciation of the interest taken in their welfare by the firm, by presenting the president, E. C. Boeckh, with an illuminated address. Disability and life insurance policies were recently taken out for all employees.

The ratepayers of Listowel, Ont., recently passed a by-law granting partial exemption from taxation to the Andrew Malcolm Furniture Co., Limited, of that town for a period of years. Now that this by-law has passed, it is the intention of this company to commence the erection of new dry kilns and also a new warehouse.

The North American Lumber and Supply Co., of Winnipeg, are issuing a useful calendar. In addition to the date pad, it includes a memorandum pad with a space for each day of the year. The calendar is intended primarily for rural distribution among the friends and customers of the company and will be appreciated no doubt, by all recipients.

The F. E. Coombe Furniture Co., Limited, Kincardine, Ont., are considering building an extension to their factory. This will take the shape of a three-storey addition 50x100 feet. It is just possible that this work will be undertaken during the coming summer, although it will depend largely on the cost of building together with general business conditions.

E. B. Salyerds, Preston, Ont., whose hockey stick and brush factory was recently destroyed by fire, has taken over the plant formerly occupied by the Canada Machinery Corporation, and will put in the equipment necessary to carry on the manufacture of his line. Mr. Salyerds has secured a lease of this building and will resume manufacturing operations at the earliest date possible.

The Durham Furniture Co., Limited, Durham, Ont., remembered all their employees at Christmas time. The married men were each presented with a goose, the single men with neckties and the female employees with silk hosiery. Over one hundred geese were distributed in this way. These gifts came as a pleasant surprise and were appreciated by the recipients.

The plant of the B. C. Separator Co., Limited, manufacturers of wood separators for storage batteries has been moved from Eburne, B. C., to New Westminster, B. C. This company has been reorganized under the management of J. H. McDonald. Additional machinery is being installed and the company are in shape to undertake production on a comprehensive scale. This is the only plant in B. C. making battery separators.

The Pickrel Walnut Co., St. Louis, Mo., manufacturers and dealers in walnut, have issued a decidedly novel and useful wall calendar.. It consists of an attractive, well finished (duo-tone), walnut panel 11 in. by 20 in., upon which is printed in gold lettering the name and address of the company. The calendar proper takes the form of a pad with particularly large numbers. This calendar would form a welcome addition to the wall decorations of any office.

Arthur B. Cowan, Galt, Ont., recently passed away at his home in that city,, in his 75th year. The late Mr. Cowan was well known in the woodworking machinery field, having been actively connected with Cowan & Co., of Galt, Limited, from its inception until he retired four years ago. He was known by woodworkers from coast to coast, having travelled for forty years. Mr. Cowan is survived by two brothers, William and James, and one sister, Miss Margaret Cowan.

T. F. Fitzgerald who is in charge of the local offices of the Canadian Edison Phonographs, Limited, St. Thomas Ont., was recently in conference with the executives of the United States firm at East Orange, N. J., where he learned that no definite plans had been made for the opening of the Canadian plant at St. Thomas. However, Mr. Fitzgerald is hopeful of seeing the plant in operation sometime during the coming summer or fall.

The Westminster Shook Mill, Lulu Island, New Westminster, B. C., is producing finished box material at the rate of 35,000 to 40,000 feet per day or about 1,000,000 feet per month. The bulk of this product is going to the East Indian market. The officials of this company are the same as those of the B. C. Manufacturing Co., though the two organizations are carried on as distinct operations. J. H. McDonald is the manager, R. L. Cluff president and P. J. McMurphy, secretary.

Your Protection—
Our Guarantee

THE KRAETZER-CURED LUMBER CO.

Stamped on
Every Piece

The Economy of the Obvious

When you buy gum that is stained you are buying in the dark.

This graded, but stained gum arrives at your factory and is worked up into your own particular product.

Then comes the reckoning

From your plant superintendent comes the report that of the last delivery of gum such and such an amount had to be discarded because of dote, some more because of check, and more, perhaps because of wormholes.

All this because neither you nor the grader could see the defects—defects covered by the stain.

The Obvious Gum

When you buy KRAETZER-CURED GUM you know what you are getting. Each piece is bright and clean, and free from stain.

All stained gum is dotty or rotten in the interior of the piece—much of it so badly as to entirely unfit it for use.

Can your scratch-pad figures prove any real economy in buying stained and incorrectly graded gum when clean and correctly graded KRAETZER-CURED GUM can be purchased at a great eventual economy?

Write or wire to us for quotations.

The Kraetzer-Cured Lumber Co.

GENERAL OFFICE: GREENWOOD, MISS.

A. E. Clark Outlines Hardwood Situation

Shows Definite Signs of Improvement --Lumber Likely Scarce Item During Next Year —Lumber Users as Well as Manufacturers Should Strive to Maintain Stabilized Hardwood Market

By A. E. Clark, address before Wholesale Lumber Dealers' Association

A discussion of the hardwood lumber situation of to-day is one upon which I hesitate to enter since it is fraught with so many of the elements of contradiction, according to the man's viewpoint. I can truly say, however, that the dealer and manufacturer of hardwood lumber has never at any time during the past year had any complaint to enter from the fact that the situation was at any time without variety. The season of 1920 was one in which hardwood soared to heights untold, but great has been the fall thereof.

In reviewing present-day conditions, one must necessarily refer back to the past years. What we referred to during the two years preceding the immediate past one as our boom years may now also be referred to as our boomerang years. 1919-1920 trade years were such that prices soared to extremes and were nothing more or less than pure gambles in many instances, and while this is true, I do not think the lumberman is unduly to blame. During the war the lumber manufacturers worked out to full capacity, and even then could not fulfil the needs of the country. After a month or two of sagging market at the close of the war, we again experienced a boom in all trades. Prices of production continued to ascend with consequent increases in lumber prices.

The complexion of the hardwood market has during the recent few years changed materially, as the advent of the motor and truck trade had produced a market which called for from 50 to 60 per cent. of our total hardwood production. The extreme shortages of supply caused many consuming concerns to order double and triple their necessary supplies on the assumption that they would only get partial deliveries anyway. This, coupled with the buyers, bidding against one another for available stocks, permitted of a gamblers' market, in which prices got to almost anything asked. However, this did not spell all profit for the lumberman, for what was true in lumber sales department was also true in machinery, food supplies and labor, and costs of production reached the breaking point.

Danger Signals Should Have Gone Up

Early in1920 signs were many that conditions were changing and danger signals should have been hoisted. Unfortunately we, as lumbermen, had large orders booked into the future and failed to read these danger signals or halt until our customers began asking for delayed shipments, and finally for cancellations. It is not necessary for me to tell you what the result of this over-purchasing and consequent cancellation of orders has been. The past year, during which most of the trade were carrying lumber produced at the extreme cost or purchased at extreme price, has told its own story. As we have endeavored to move this high-priced stock, we realize how thoroughly all branches of trade and manufacturing have been demoralized.

The past few months have begun to show some considerable signs of improvement, and we now find consuming trade realizing that they must shortly purchase stock if they are to continue operation of their factories. The purchasing is not going on in great volume, as the uncertainties of the situation, or as we sometimes feel inclined to say, the failures of the purchaser to recognize bargains when offered to him have retarded large purchasing. In general, I think the manufacturers and wholesalers have absorbed and written off the loses incumbent on previous high costs and speculation. The situation still presents its difficulties through the failure of some branches of industry to recognize its share in the absorption of losses and reductions to restore the wheels of industry.

Viewing conditions first from the pessimist's side, consideration must be given to a few prominent features. The Western situation is not as healthy as we should wish, through the fact that the farmers' products are at a very low point. This is reflected to us through the slackness in the implement trade. Building has not yet gotten back on its proper plane, due, Ishould say, in part to the refusal of some of the supply concerns to accept reduced prices, but due largely to the attitude of labor, more particularly in large centres.

Must Be Prepared to Accept Reductions

To my mind the restoration of trade activities to a normal basis requires the sacrifice of all peoples. We must all be prepared to accept the reductions whether they be reductions in profits or reductions in wages. We must also be prepared to put our full energy into our enterprises again. There's nothing the matter with business, but there does seem to be something the matter with ourselves in our relation to business. Business will not go without "pep" and restore the confidence in order to start the motion.

During the past few weeks I have called on a large number of our cutsomers of hardwood lumber, and there is no question but that the situation has undergone great improvement. The furniture business, piano business and automobile business are better. Railways are doing more buying. Building has improved and has in some sections developed to almost a boom. The consuming trade have reduced their hardwood stocks and are not over-supplied. The flooring plants and box plants are gradually absorbing the over-supplies of low-grade hardwood.

RICHARDS-WILCOX CANADIAN CO., LTD., LONDON, ONT.

Have You Met This Year's Lumber Needs?

The turn of the year has developed a more cleancut picture of hardwood supplies. In the matter of production natural causes are now fully in force in retarding output. What natural causes will not accomplish will be insisted upon by the bankers. Production is definitely prescribed and can not be expanded before spring.

Consumption shows improvement, developing increasing call on already much overstrained stocks. Anderson-Tully's Seventy Million Feet of annual Hardwood Production and the varied nature of its operation have fortunately made it possible to keep our stocks well rounded out. This stock runs in quartered and plain oak, gum and other Southern woods in lumber and veneers and is sold under our consistent high standards of quality and services.

We shall be pleased to help any buyer cover his season's needs.

(Continued from page 49)

Building Material Costs

In May 1920 the wholesale price of 48 building materials reached a peak price of 184 per cent above 1913, whereas the average for the year was 165 per cent above the pre-war. In December, 1921, material costs had receded to a point 93 per cent above 1913, or about 50 per cent below the peak.

While prices are still much above pre-war levels, the decline from the peak has been fairly radical. During the past building year they have remained relatively stable and with the prospect of general business activity increasing, the probabilities are that they will go but little below present levels until the edge is taken off demand by a year of fairly active building.

Building activity has been greatest in those sections wherein wages have liquidated most or where some other contributing factor has made building more attractive, relatively than in other sections. We expect this movement already underway in some sections, to spread rather generally, and believe that by next spring, the level of such wages will be considerably reduced. The present scale of building wages for the country as a whole is less than 10 per cent below the peak of 1920. There is no doubt at all that this condition has contributed most largely towards deferring activity, This year a real effort should be made to provide work for the building trades as soon as winter breaks. During recent years there has been so much jockeying over wages and hours of labor that several weeks or months of good spring weather have been lost. Let us hope that employers and employees will come to an agreement this year before the end of March.

The Outlook for 1922

All told we think that 1922 should see a substantial increase in general building activity. The country has passed through the worst stages of depression, and is now on the upgrade. Indications are multiplying that general industry is advancing slowly but surely. The fact that construction activity is holding up at an unusually high level through the winter months, taken with other known factors that are likely to effect the rate of activity next year, gives promise to an unusually good year for construction in 1922.

With the progress of credit liquidation and the rise in bond prices, and the lower cost of building, mortgage money will probably be in easier supply and at lower rates, and there is a fair probability of lower freight rates in building materials. While over the longer trend it is almost certain that a year or two of active building will bring construction values downward, the present unfilled need indicates no such trend for 1922.

The present prospect is that spring will furnish an unusual opportunity for profit to the builder. Interest rates, wages, and material prices will all presumably be relatively low. Both 1922 and 1923 will probably be years of more than normal building activity, but the prospects are that the man who builds this year will stand a much better chance of making a profitable return than will the man who postpones construction work until 1923.

1921 was a year of liquidation. 1922 will be a year of recuperation. We are not in a period of "hard times coming." We are in a period of "soft times going." Prosperity is coming—it's time to go out and meet it.

Kiln Drying Course for Home Study

Since the announcement of the correspondence-study course, Kiln Drying of Lumber, by the Extension Division of the University of Wisconsin less than two years ago, almost 400 persons have enrolled. This course has been developed through co-operation of the U. S. Forest Products Laboratory. Men from 37 States of the Union and seven foreign countries have taken up this mail instruction to learn more about the art of operating dry kilns, and the proper handling of lumber in general.

The distribution of the students according to states reflects fairly well the location of the lumbering and wood-using industries. The registration runs as follows. Indiana, 39; Wisconsin, 37; Michigan, 35; California, 23; Illinois, 19; New York, 18; Pennsylvania, 13; Missouri, 12; Washington, 12; Louisiana, 11; Kentucky, 10; and all other states, 109. The registration from foreign countries includes 16 from Canada, and one each from Mexico, Panama, Porto Rico, England, China, and New Zealand.

This correspondence-study course is an outgrowth of the resident short courses which have proved so successful at the U. S. Forest Products Laboratory, located on the university campus. It was early recognized that much of the information on improved methods of kiln drying could be taught by mail. Many men who cannot avail themselves of the class instruction in Kiln Drying given at regular intervals at Madison enroll for the correspondence-study course and so obtain valuable information upon the latest developments in the seasoning of wood.

The text used in this course is specially prepared and in such a form that it can readily be understood by any one with only a common school education. Many of those who have successfully taken the course had not finished the common school grades. Others have had more education, while a considerable number have been college gradnates. But the way the work is organized, the value of the course can be easily fitted to the needs of the individual, and each one with the co-operation of the instructor builds up a series of papers that when completed make a volume of information exactly suited to each individual.

The Extension Division of the University of Wisconsin, Madison, will gladly supply information on request.

A. E. Clark Outlines Hardwood Situation

(Continued from page 96)

As reports come in, I can see a marked improvement in the export situation. I should say that the situation to-day is, that while our available supplies of dry hardwood look to be large, that is only when viewed from the blue ruin glasses we have worn for the last few months. Trade conditions are better and are improving, and the only over supplies of hardwood are the low grade. The crying need of the world is building, and this need has reached the point where it cannot be denied; therefore, your low-grade surpluses will not trouble you long.

Lumber Shortage During 1922?

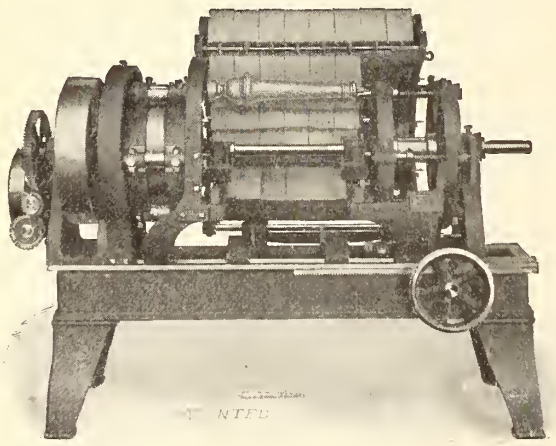
But, gentlemen, let us profit by the bitter experience of the past. We do not want a runaway market again. I have no doubt in my own mind that 1922 will show up a marked shortage of supply in practically all kinds of hardwood in the grade of No. 1 common and better. Production in U. S. and Canada during 1921 has been much below normal. The proposed production this winter, both in the north and south, is low, most people placing it at around 25 per cent. of normal. This small output is due almost in its entirety to the fact that prices of hardwood to-day are so low that the producer cannot get a profit. Now, the cure is a reasonable increase in prices, and I feel sure it is coming. I think our danger lies therein. If we get a reasonable increase in prices consumers will not be in any way injured, but if we permit the impending shortage to create a runaway market again, it must do harm.

A feature that has influenced the hardwood markets and retarded recovery has been the excessive freights now in effect. Hardwood transported on a per hundred basis and being a heavy material, suffers probably more serious than the other lumber lines. The local rate situations tend to discourage consumption of Canadian lumber and benefit the southern product through the unfair rate basis by which local rates are all out of line with through southern rates. This rate question, too, is discouraging more particularly in the sale of low grades, as it seems ridiculous to pay $180 for a car of low-grade lumber and $200 for freight. The sooner the railway companies recognize they are killing business, and restore rates prior to the 40 per cent. increase, and then automatically reduce the wages of their overpaid employees, the sooner will good business result.

Resaonable Profit and Stabilized Situation

I should sum up the hardwood condition by stating that, unless some unforeseen feature enters into our present situation, the man who holds hardwood lumber to-day should consider he has an asset which in the very near future the consuming trade will recognize the value of. At present his product is being sold at even less than the present day cost of reproduction. He is justified in holding for cost plus a reasonable profit. The man who knows his business can prove his position in this matter. Consumers will recognize this argument, but they will also recognize any attempt to create another runaway. Let us endeavor to get a reasonable profit and a stabilized market.

DO YOU KNOW



what it is costing you to sand your furniture and chair turnings by hand rather than on a Nash Sander?

If you don't it is high time you gave this matter serious thought.

Now is a good time to look into this.

J. M. NASH, Milwaukee, Wis.

A Friendly Talk on Co-operation

The following chat by a large manufacturer of hardwood lumber should carry conviction for instead of urging woodusers to buy, it suggests caution and conservativeness in making lumber purchases:

Lumber prices have advanced. Some further advances in the lower grades are necessary in order to bring the average log run price to a basis that will justify production. But don't let's go too far.

The influence of the vast amount of distress stock during recent months discouraged production. Stocks of the higher grades are exceedingly light; and there is no chance to increase production now, as the season for logging has passed. The stage setting is identical with 1919, but let's keep our heads—surely experience makes men wiser.

Unwarranted inflation of prices is inevitably followed by a decline to levels that do not return the cost of production. The first is burdensome on you, the second is ruinous to us. Let's co-operate to stabilize prices, to eliminate violent fluctuations.

Our duties are clear. Ours is to manufacture as much lumber as we can in order to make up the shortage. Yours is to refrain from speculation. Buy all the lumber you need and figure on a reasonable margin of safety, but don't take from the present limited supply, lumber that you will not require for a long time to come.

We are moving forward to better things, but let's move sanely, apply the lessons we have learned, and co-operate as we march along.

Good workmen use safe tools. Defective tools are fit only for the scrap heap. Use only tools that are in good condition and on work for which they are designed.

Perkins Vegetable Glue

is applied cold and will not congeal in cold weather—
a fact to bear in mind at this season of the year.

One Belt Power Driven Veneer Press 36 x 54"
One Fay Egan Chain Feed Rip Saw (Lightning)
Various sizes three drum Royal Invincible Sanders

These Machines are all guaranteed in first class condition. Victor J. Reed Esq., Jamestown, Ohio. 1

POSITION WANTED

Can you use the services of a young married man, 35 years of age who has been on the executive of a large woodenware manufacturing concern for the past ten years. Has plenty of initiative and would consider salary as secondary consideration if given an opportunity to grow up with an established concern. Excellent references. Box 123 Canadian Woodworker, Toronto. 1

WANTED

Thoroughly experienced Hardwood Lumber salesman. Give full particulars in first letter as to territory travelled and want to travel, experience and who worked for, references, salary expected, and when can start. Box 122 Canadian Woodworker, Toronto, Canada. 1

POSITION VACANT

Salesman desired, with established trade, to handle on commission in Canada a complete line of Reed Chairs and Furniture, and Children's Reed Carriages. Address Box 124 Canadian Woodworker, Toronto, Canada. 1-2

FOREMAN WANTED—for Sash, Door and General Woodworking Factory in Eastern Canada. Man wanted must be able to speak both French and English, must be first class mechanic, understand thoroughly woodworking machinery and be able to lay out his work. Steady position for the right man. State clearly first letter, experience, whom worked for, age, married or single, wages required, and when ready for work if application is accepted. Apply Box 121 Canadian Woodworker Toronto. 1

LEAD MINING IN SWATOW DISTRICT

The Chuling Mining Works, which is working a lead mine in Chenping district, China, recently made its first shipment of lead. Smelting by native methods is carried on at the mine, the present capacity of the furnaces being 3 short tons per day. It is proposed to double this furnace capacity at an early date. A high-grade soft lead, running between 99.97 and 99.98 per cent. pure, is produced. It is shipped in slabs weighing 140 catties (about 185 pounds) each. About 115 short tons have already been exported. A ready market for this product is found in South China.

ELECTRIC RAILWAY CONSTRUCTION IN NORWAY

Information from Christiania states that the Norwegian Storthing has granted a concession to A/S Akersbanerne for the construction of an electric railway from the centre of Christiania to Ostensjo, a distance of about 8 kilometers. Work on the line will be commenced simultaneously with the construction of the Majorsteun-Sognsvandet railway, a concession for which was also granted recently.

A/S Kristiania Elektriske Sporvei (Electric Tramway Co.) will soon begin construction on the extension of its Lilleaker line to Stabaek. This work will cover a distance of about 4 kilometers.

ASPHALT FOR ROAD-MAKING IN AUSTRALIA

It is likely that asphalt roads will be used in Australia to a greater extent in the future, owing to the increasing cost of wooden blocks and the difficulty in obtaining them. Pending the purchase of an asphalt plant by the City Council of Melbourne, it has been recommended that the penetration method of binding macadam by bituminous material be adopted in some of the light-traffic streets of the city.

INCREASE COPPER PLANT

Chile Copper Co. plans for an increase in plant capacity from 15,000 tons to 35,000 tons a day as soon as conditions warrant. This should give the company a capacity for producing 300,000,000 pounds of copper annually, and on the basis of the 1920 cost of producing little more than one-third of this amount, it is estimated that Chile should then turn out its copper for 8 cents a pound, if not lower.

GREEK COAL IMPORTS

At present from 250,000 to 300,000 tons of coal are annual imported into Greece. In 1920 about 212,000 tons were imported, of which 50 per cent. came from the United States, 45 per cent. from England, and 5 per cent. from other countries. According to statistics received from official sources, up to August 31 of this year England sent 80,615 tons and the United States 41,890.

The Mother of Invention

Another interesting instance of evolution in manufacture is Fibro-Kane Patented Reeds and Webbings. Starting over twenty years ago when reeds and rattans were very scarce by reason of government disturbances at Singapore, with a mediocre substitute for flat reeds, when rattan again became available those who had been using this substitute went back to the genuine article. The manufacturer of fibre however had had emplanted in his mind a very fertile seed. Continual experiment resulted in Fibro-Kane being patented shortly before the war.

At that time genuine rattan was available in large quantities at low prices. Furniture manufacturers, as with all of us, took the line of least resistance. Those who could appreciate the superior qualities of the new article could se better the fact that rattan had been used, was being used and seemed to answer the purpose. Besides they would have to educate their help to use it. Labor did not like new things. Then again their own salesmen would have to explain its virtues to the retailer and possibly the retailer to the onsumer. It seemed like too much trouble and as is often the case it looked as though the inventor was to have nothing for his labors.

Then war in 1914! Germany had been the world's largest splitters and was entirely cut off, resulting in a great shortage of all reed products. Furniture manufacturers scrambled over each other to buy meagre supplies. Prices soared. Specially chartered ships scurried here and there to bring raw rattan to the United States but even that which arrived could not all be split. Our help and our manufacturers were not experienced and did not have the machinery.

For a time it looked as though rattan products generally would be eliminated in the manufacture of furniture. Under the urgency of demand however the organization by which Fibro-Kane was manufactured, expanded, first caring for the baby carriage trade with flat, split and round reeds, then rapidly and successively into close woven webbing for the suit case and furniture factories, twill webbing for car seating and finally round open webbing in all width meshes. The little Fibro-Kane business like England's 'contemptible hundred thousand" had grown as needed and prevented a serious curtailment during the war which might have become permanent, of the use of all reed and rattan for manufacturing furniture.

However, so much for necessity. The education of everyone to the qualities of Fibro-Kane was not forgotten. To-day fibre furniture is one of the leading factors in the industry. From an article used from necessity it has become a product recognized as equal in all and superior in many respects to genuine cane by most of the nearly one thousand furniture manufacturers to whom it has been furnished.

Dates For Kiln Drying Courses

The Forest Products Laboratory announces that with the giving of dry kiln courses in the west, only two courses will be offered at Madison, Wisconsin during the next six months. The first will be held January 16-17, 1922, and the second June 5-16, 1922 Arrangements are under way to give several kiln drying courses in the lumbering centers of the pine, fir and redwood regions of the western states, where much interest is being exhibited in a kiln drying program.

Globe Vise & Truck Co.
GRAND RAPIDS, MICH.

We also manufacture a complete line of steel trucks particularly for wood working factories. The body of our truck is absolutely indestructible, and there are no nails nor screws in the top to mar material, whether finished or unfinished. The roller bearing feature in the wheels allows for much easier handling than the old style plain wheels on the wood truck. In fact one man can handle much more material than on the old style. The price is very little more than that of the old style wood trucks.

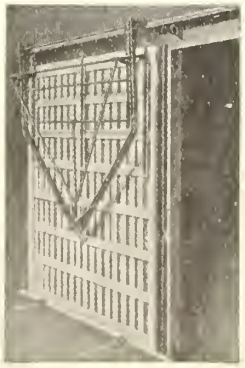
BLACK BROS.
CLAMPS

Where Black Bros. Clamps are known, there is no second choice. Know them.

Sold by Aikenhead Hardware Ltd., Toronto Vokes Hardware Co., Ltd. Toronto J. L. Neilson & Co., Winnipeg and other leading dealers throughout Canada.

The Black Bros. Co. - Mendota, Ill., U.S.A.

The Door Carrier System



Makes your dry-kiln doors steam-tight and saves time, heat, trouble and money.

Carrier lifts door clear of kiln and carries it down track. Returning, deposits door to rabbeted joint, where it is held steam-tight by its own weight. Applicable to old or new kilns.

Ask for catalogue.

The "Merit" Three-Plate Veneer Re-Drier
has two openings only and is designed for plants having need of a re-drier of moderate cost and of limited capacity.

The machine is electrically driven and is piped for connection with the factory steam line.

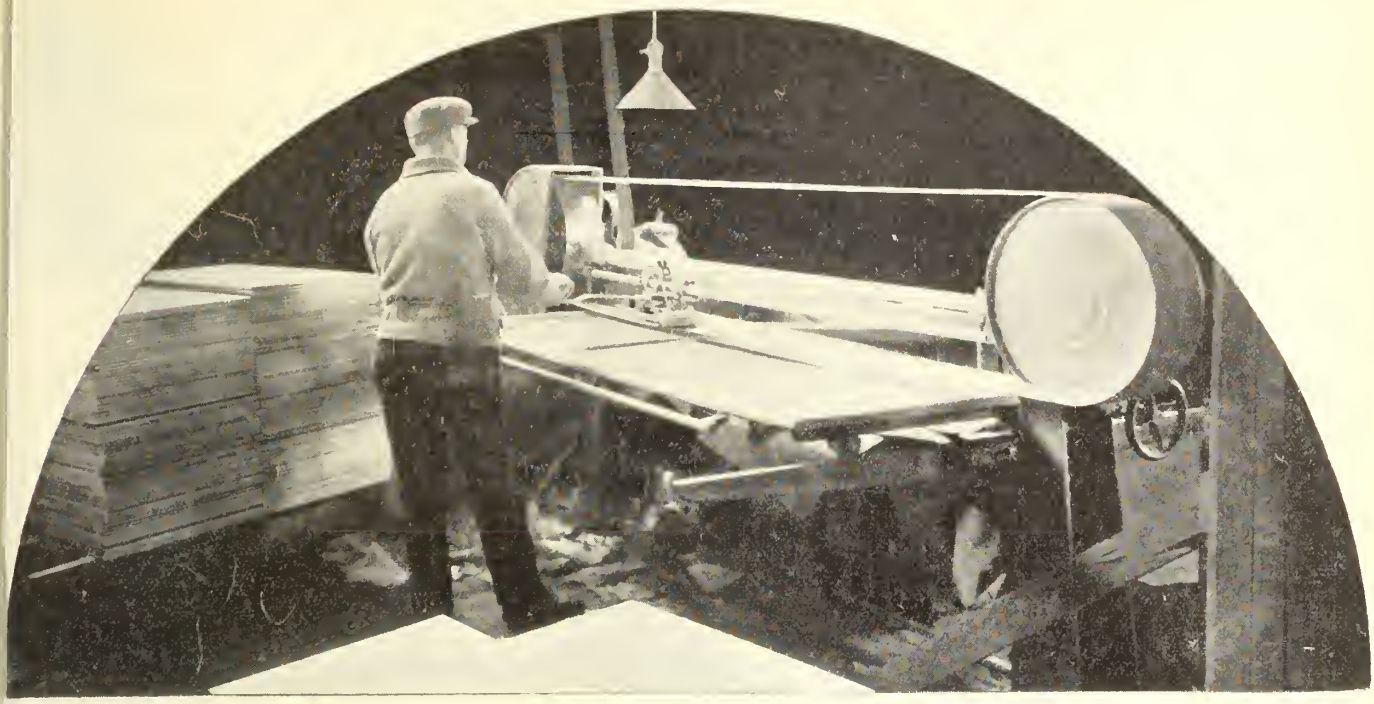
A vertical movement of the middle plate gives the veneer pressure first in one opening and then in the other and provides the well-known "Breathing Movement" peculiar to Merit Re-Driers.

MERRITT ENGINEERING & SALES COMPANY
LOCKPORT, N. Y.

MESCO
The "Merit"
Re-Drier
FOR VENEER
INSURE your veneer work against surface checks, hair lines, blisters, warping and glue failure by installing a "Merit" Re-drier..
Thoroughly dry and flat veneer avoids these troubles, gives tight joints and saves glue.
No system of air drying will accomplish this result. Hot Plates with "breathing movement" are the thing.
MERIT

The
"Steelgrip"
"Steelgrip"
METHOD IS THE BEST
for making mitered, butt or any other joint
Used by all leading Furniture, Cabinet and Casket Manufacturers.

In using *"Steelgrip"* CLAMP NAILS
only the ordinary machine work is required. Cut a slot, drive in a "Steelgrip," that's all. No clamping, no waiting for glue to set.
Avoid Substitutes
"Steelgrip" CLAMP NAILS
Save Time + Labor = Money
Produce, Strength + Durability = Better Product
Shipped in cartoons of 1 lb. 5 lbs. and 10 lbs. each. Bulk packages 25 lbs., 50 lbs. and 100 lbs. each
CLAMP NAIL COMPANY
4532 PALMER STREET, CHICAGO
CIRCULARS and SAMPLES ON REQUEST.



Now They Do a Better Job of Sanding Mahogany Veneers—

IT wasn't so very long ago that the men on the sanders in a certain plant began using Carborundum Brand Garnet Belts in No. 1 grit on sanding thousands of fine mahogany veneer panels.

They had been going on the theory that garnet belts were just garnet belts and that one make was about as good as another until—

They began using belts they cut from Carborundum Brand Garnet Cloth.

Then it wasn't long before they realized that there was a difference. Now they have belts that cut speedier, cleaner, more uniformly—belts that are true and even, belts that produce more work—better work.

CARBORUNDUM BRAND GARNET PRODUCTS ALWAYS MAKE GOOD SANDERS BETTER SANDERS

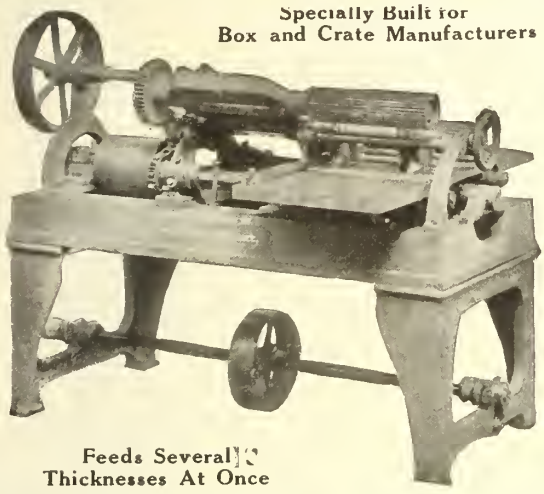
"The Chattanooga" — Just Another Name For Fast, Economical Gang Ripsawing

Specially Built for Box and Crate Manufacturers



Feeds Several Thicknesses At Once

This latest improved gang ripsaw is powerful, fast, safe and eliminates wastage. For gang sawing boards into strips or head sticks and for ripping veneers it is unsurpassed.

Has powerful feed and securely holds down and feeds short pieces. The feed rolls are automatically adjustable to varying thicknesses. Upper rolls are driven by cut gears, and the lower ones by sprocket chain. Several thicknesses of veneering can be fed thru machine at one time.

The CHATTANOOGA is an unusually big producer, easily operated, and turns to profitable account short stuff lying around a mill—otherwise wasted.

Attractive price. Complete information on request

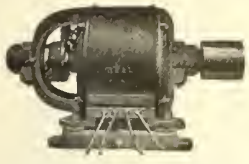
Is it economical ?



Is it the right type ?

Is it the right size ?

THREE GUESSES

Electric power, heating, lighting and equipment problems are to be found in the lumbering and woodworking industries.

Perhaps your output can be increased? You are, perhaps, losing electrical energy by wasteful types of motors? Are your switches and wiring devices up-to-date or are you in continual danger of fire?

We shall be pleased to answer any questions or help you with any problems whenever you care to write us.

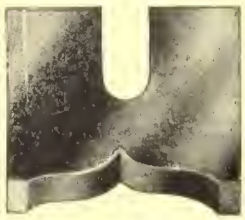
STERLING QUALITY
SAWS and KNIVES
CUT?



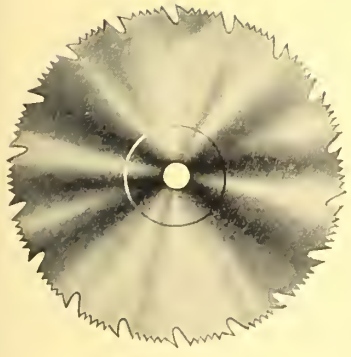
You Said It!

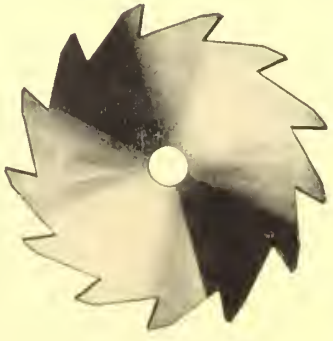
You can find low cost in Atkins Saws and Machine Knives. It's in their long service.

For efficient cutting in all kinds of timber, they they have no equal.

It's Atkins formula for the steel that makes them do the excellent work for which they are famous. This, together with the acme of perfection in temper and workmanship, have made them known as

"THE FINEST ON EARTH"





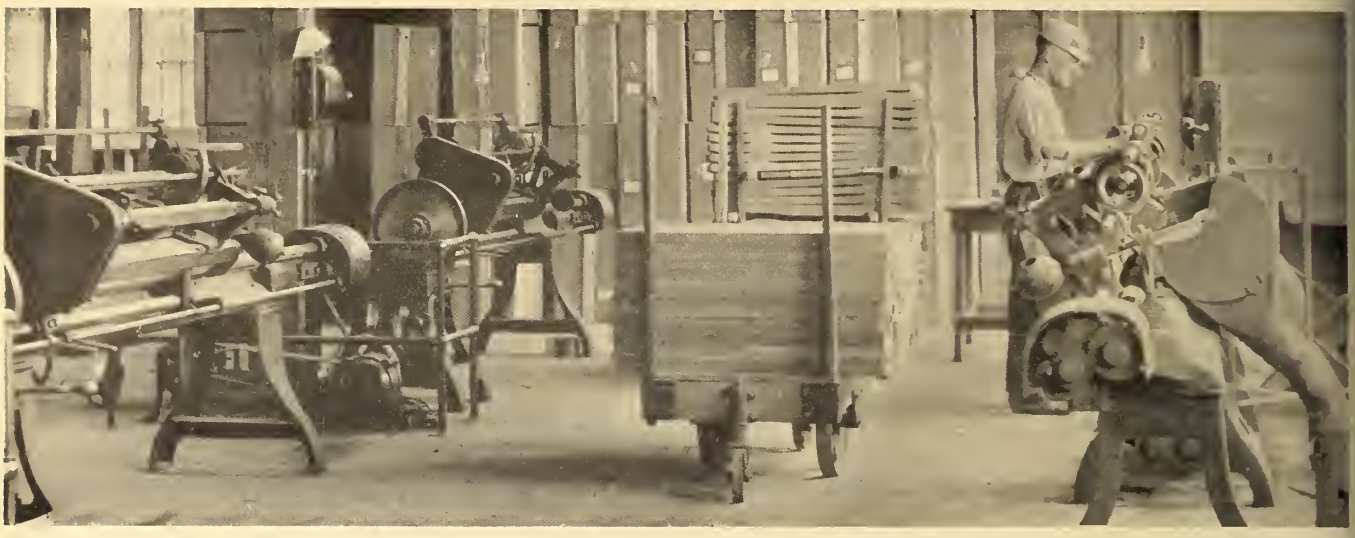
Write to-day for our Knife Booklet "C.W." and Pattern Template Paper.

E. C. ATKINS & CO.

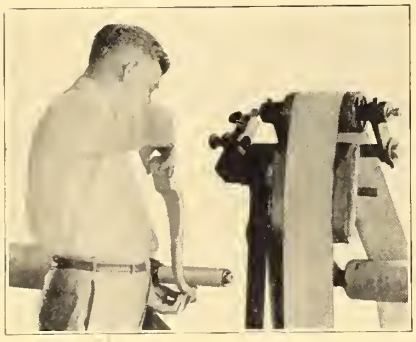
Makers of Sterling Saws

Factory—HAMILTON, Ont. — **Vancouver Branch—109 Powell Street**

One Man Shapes and Finishes Queen Anne Legs



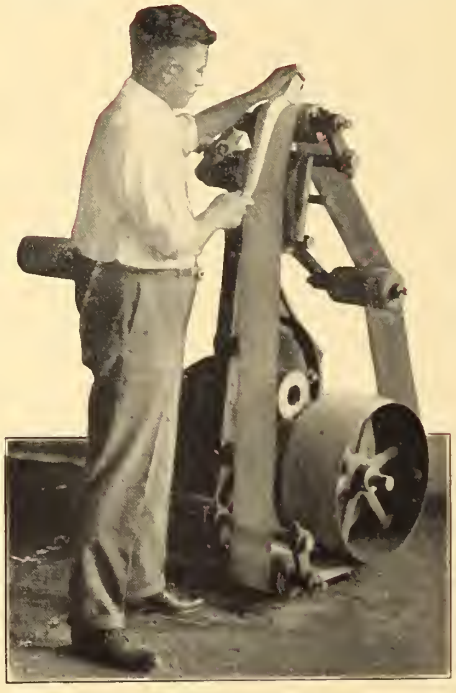
The manufacturer of Queen Anne styles can now produce the legs at exceptionally small labor cost. One man can look after the automatic leg-forming lathe in connection with the operation of the belt sander or other machine; or as many as four of the lathes can be handled by one man, because the cutting operation is purely automatic.



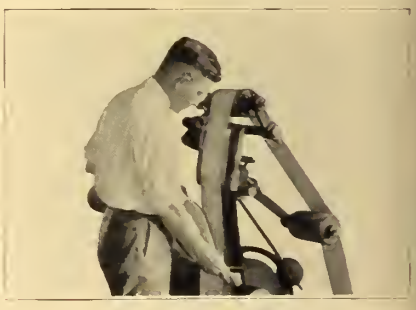
Pneumatic sanding drums supply just the right resiliency for cleaning up the extreme curves

FOR your beautifully designed cabriole patterns there is no other machine so well suited as the Mattison "214" Automatic Leg-Forming Lathe. It is specially designed to produce the irregular-shaped Queen Anne legs accurately and at a minimum labor cost. The cutting operation is purely automatic which reduces the labor to the actual time required to change stock. The man who tends the lathe can sand a leg on the "115" Belt Sander while another is being cut in the machine.

The Combination Makes an Efficient Method



Sanding flat curves against cushioned sanding roll



The flexible open belt nicely finishes the rounds

BY free-hand manipulation of the leg diagonally against the open sandbelt, shaped forms or cushioned sanding rolls, the rough sanding is accomplished very quickly. The two sizes of pneumatic sand-covered drums provide a most practical and accurate method for perfectly finish-sanding the legs. This combination of both rough and finish sanding operations in the one machine together with the lathe for automatically shaping the legs, gives the manufacturer of Queen Anne furniture a method that minimizes costs and insures accurate production of his individual and distinctive patterns.

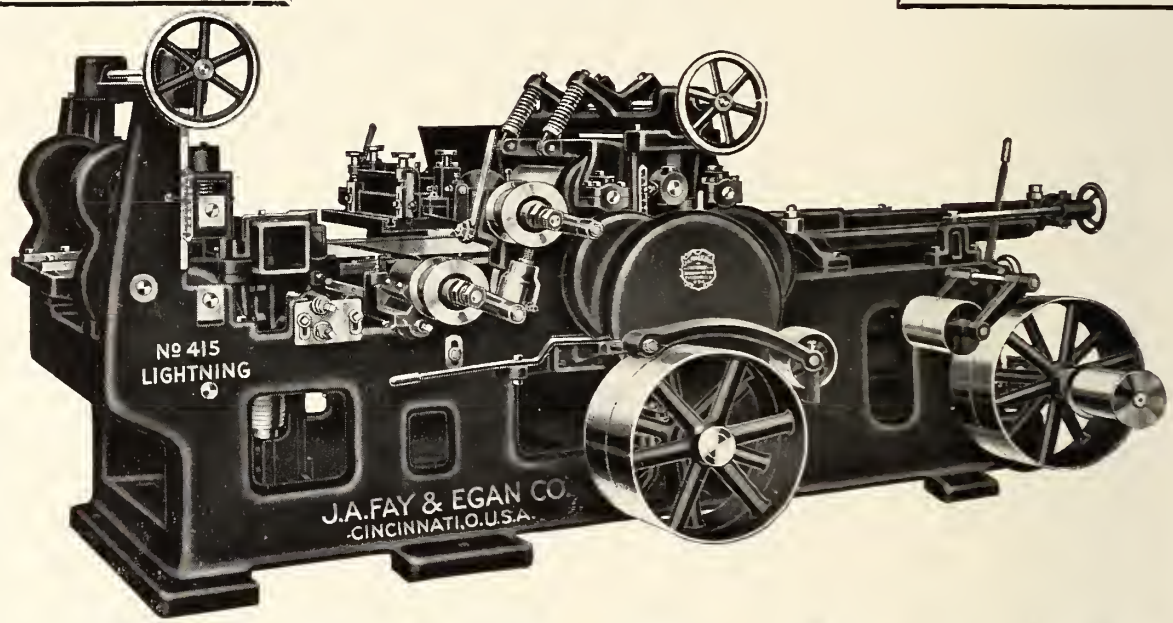
The Class of Work a No. 415 Will Do Is Beyond Criticism

The greatest general purpose Planer, Matcher and Molder presented to the woodworking industry in years.

Made in Three Sizes, 16", 20", 24" wide and 8" thick.

No. 415 has successfully met the requirements of Planing Mills and other woodworking plants for working hard and soft woods.



No. 415 "Lightning" Fast-Feed Double Cylinder Planer and Matcher

Each belt has Gravity Tightener for taking up stretch.

Write for Bulletin C-11 for additional information.

No. 415 is easily accessible for all adjustments and for setting up, saving much valuable time every day.

"The Lightning" Line
TRADE MARK REG.

It will not tear out or raise the fuzz on knotty or cross-grained stock. First costs and operating expenses are well within the reach of any mill owner.

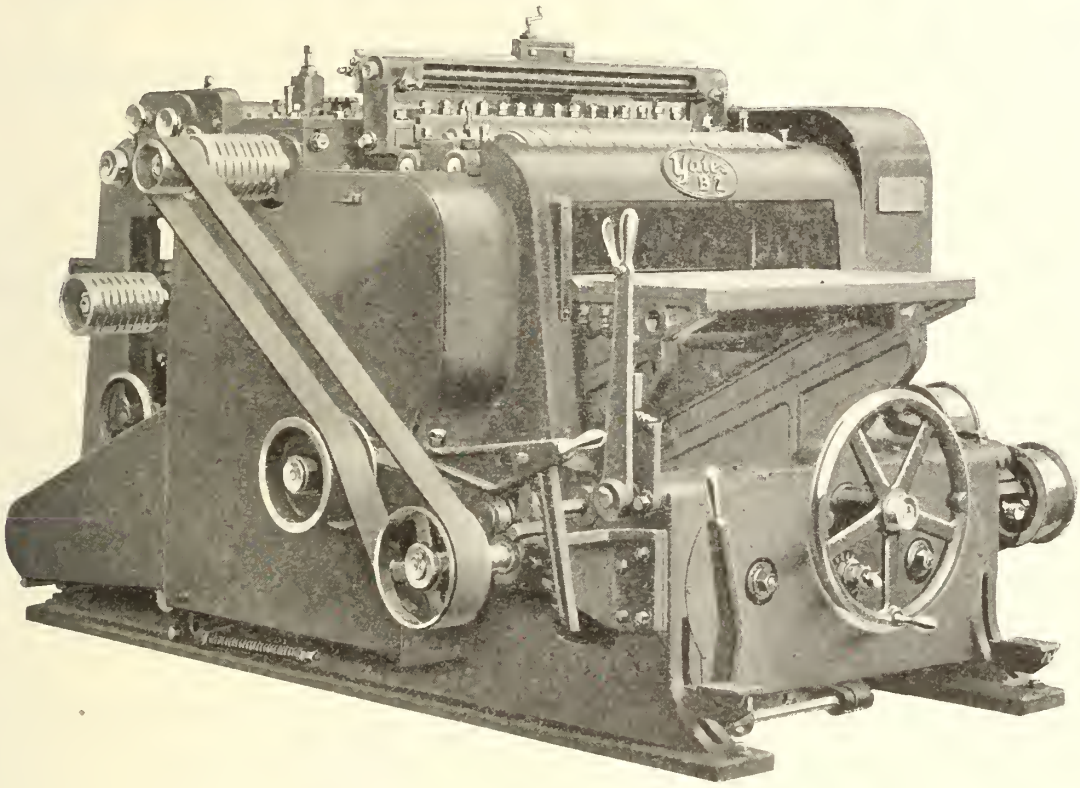
LATEST ADDITION

Yates Type B2 Yates

Double Surfacer



The machine shown above is the latest addition to the already large family of Yates Surfacers. Yates B2 is the last word in Surfacer construction. Designed and built to produce quality lumber at feeds up to 100 feet per minute and still maintain that fine finish which is required by furniture manufacturers. Stock surfaced on the B2 is so smooth and uniform in thickness that it requiries but little sanding. Built 30 inches wide. Will surface stock from ⅛ to 7 inches in thickness.

Our new four page illustrated circular explains this machine fully. Write for your copy and get the latest data on surfacers.

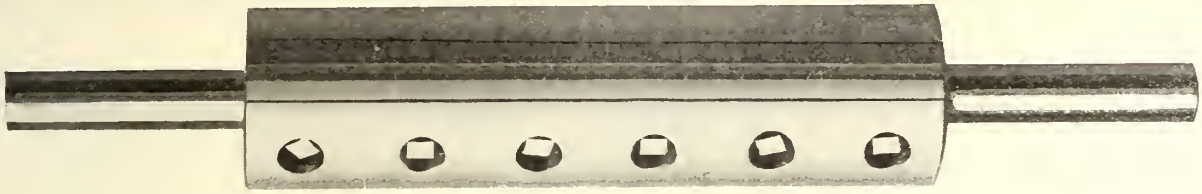
The Shimer Round Safety Cylinder with High Speed Knives



A Round Safety Cylinder that will Appeal to the Buyer and the User for three Reasons:

The first is our adjusting nut for setting the knives. It is the only cylinder with properly located adjusting nuts for setting the knives, which, with our way, can be set to 1-1000 of an inch.

The second is our way of holding the knife without tapping into the head.

The third is the correct angle of cut for the knives.

Made for Any of the Different Makers' Machines and in Any Length Cylinder.

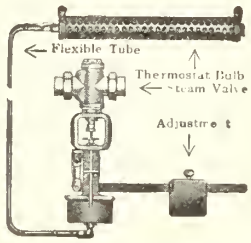
He Does His Best But

A man's eye watching the thermometer. A man's hand turning the valves. He does his absolute best, but you know that his results are not uniformly right—because at some point there was too much or too little heat.

Automatic Heat Control Stops That

At best, a man can only use his judgment of temperature, which varies from one minute to the next.



The Powers Regulator No. 15

Entirely self-contained, requiring no air or water pressure for operation. Prevents checking and case hardening in the kiln. Invaluable in the varnish drying room. Other types for other places.

Powers Automatic Heat Regulators

Eliminate the guess work by applying the Powers Automatic Heat Regulators. They are scientifically coustructed; made to operate according to certain known physical laws. We manufacture a great variety of types suited to practically any heat regulation condition.

Consult us at once. Our long experience enables us to give you definite information and intelligent advice.

REAP THE FULL BENEFIT

¶ The business paper is to-day a forceful factor in the commercial world. It is performing a service which is of most incalculable benefit to the field it represents and the country at large. Its object is to instruct and educate—to furnish trade and technical information which cannot be found in newspapers.

¶ The reader who studies the "Canadian Woodworker and Furniture Manufacturer" from cover to cover will profit tremendously. This issue, devoted primarily to modern methods, contains numerous articles which will carry education and instruction to the receptive mind.

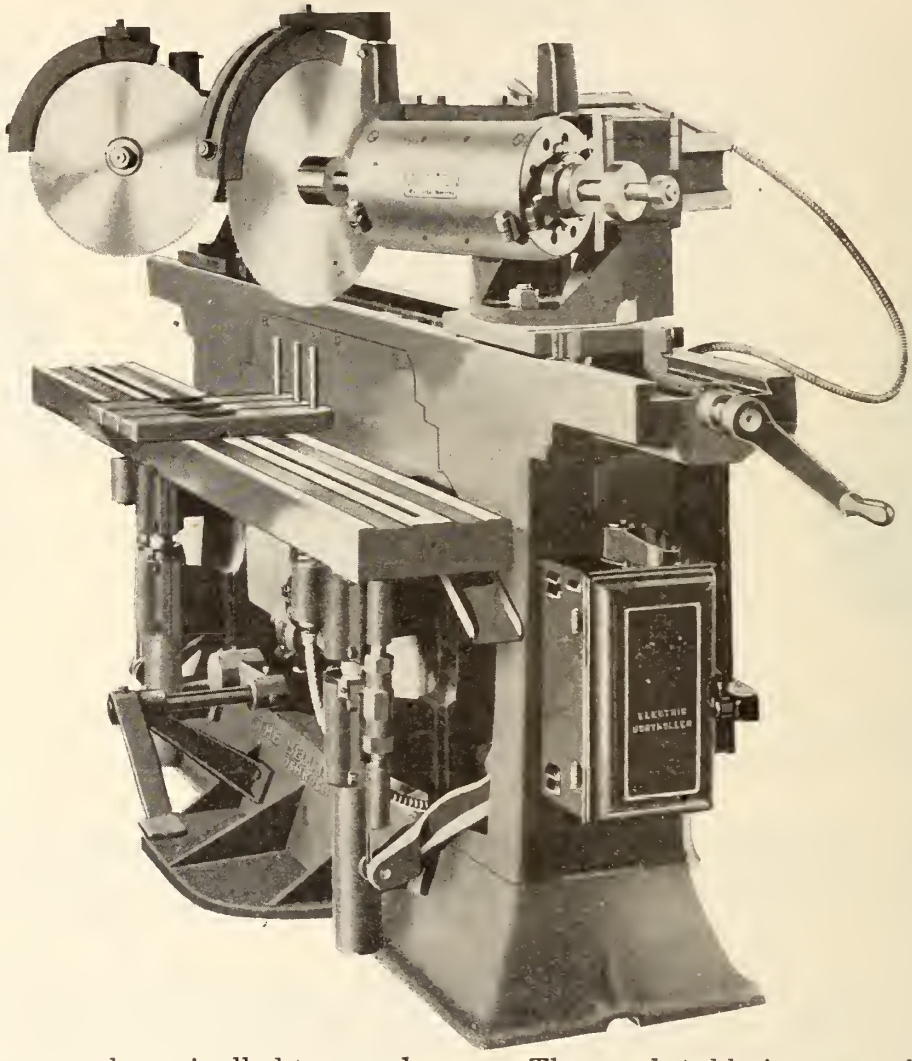
¶ The advertising pages of this number are not less interesting than the Editorial contents. They represent a directory of the leading manufacturers and dealers from whom the best equipment and supplies may be purchased. These representative firms are asking the readers of the "Canadian Woodworker and Furniture Manufacturer" for their business. They show their enterprise by judicious advertising and they deserve support.

¶ To make the most of his opportunities, the subscriber should use the advertising pages as a buyers' reference. Success in business depends in no small degree on how we buy. Study the advertising, ask for competitive prices, and take full advantage of the service this publication offers.

Canadian Woodworker and Furniture Manufacturer

THE "BELL" DOUBLE CUT-OFF SAW

Cuts Miter or Square work both ends at once
Direct Motor Driven



The saw arbors can be swivelled to any degree. The work table is power driven and, as it rises, carries the work up between the saws, cutting both ends square or on any angle desired. The machine is quickly adjustable for all angles and lengths. Compound angles can be cut both ends at once. The arbors will carry dado heads as well as saws. The variety of use to which it can be put is very great. The volume of work is very large. The operation of the machine is simple. No furniture, chair, casket, sash and door, phonograph cabinet, or automobile plant is complete without it. Furnished in either belt or motor drive.

Hot Plates for Re-Drying Veneer

Why They Succeed Where Other Devices Fail

Veneer, when ready for re-drying, has *all* of its free water removed and at least half of the fibre moisture.

The shrinkage is only partly performed.

The veneer, in fact, has reached the point where the difficulties of air drying are greatest.

It calls for the high heat of hot plates to evaporate the small remaining content of moisture.

This moisture is converted into steam by means of conduction of heat from both surfaces to the center.

The steam generated from the contained moisture reaches those surfaces which becomes moist and pliable.

A breathing movement of the plates expels the excess steam as it covers the surfaces.

It is a process of drying ***the centre first*** and the ***surfaces last.***

The sheets of veneer are held flat as they take the final set, the "breathing movement" allowing the shrinkage to take place without checking.

The heat is applied uniformly to the entire surface of the material being dried.

The application of heat is ***direct*** —no loss due to first heating a body of air which in time wastefully gives up its heat to the wood.

Humidity control in hot plates is automatic — the veneer surfaces remaining moist so long as any moisture in the wood fibres finds its way to the surface.

This humidity is greater the greater the amount of contained moisture and it automatically diminishes as the wood approaches its finished degree of dryness.

All veneer should be re-dried before gluing.

Commercial veneer contains 8 to 15 per cent moisture.

You *add* to this moisture when you pass veneer through a glue spreader.

Your glued up panels should under normal conditions contain about 8 per cent moisture Therefore, you must take out as much water as you add during the gluing process and as much more as may be needed to leave the glued up stock somewhere near the 8 per cent content.

The business end of this proposition we will be pleased to take up with you by private correspondence.

"for drying GUM

Our investigation among successful woodworkers proved we should choose

The Standard Dry Kiln

because....., and we have since proved it....." The reason is shown in our literature. If you dry gum, get a copy. Or The Standard Dry Kiln Co., 1542 McCarty St., Indianapolis, Ind.

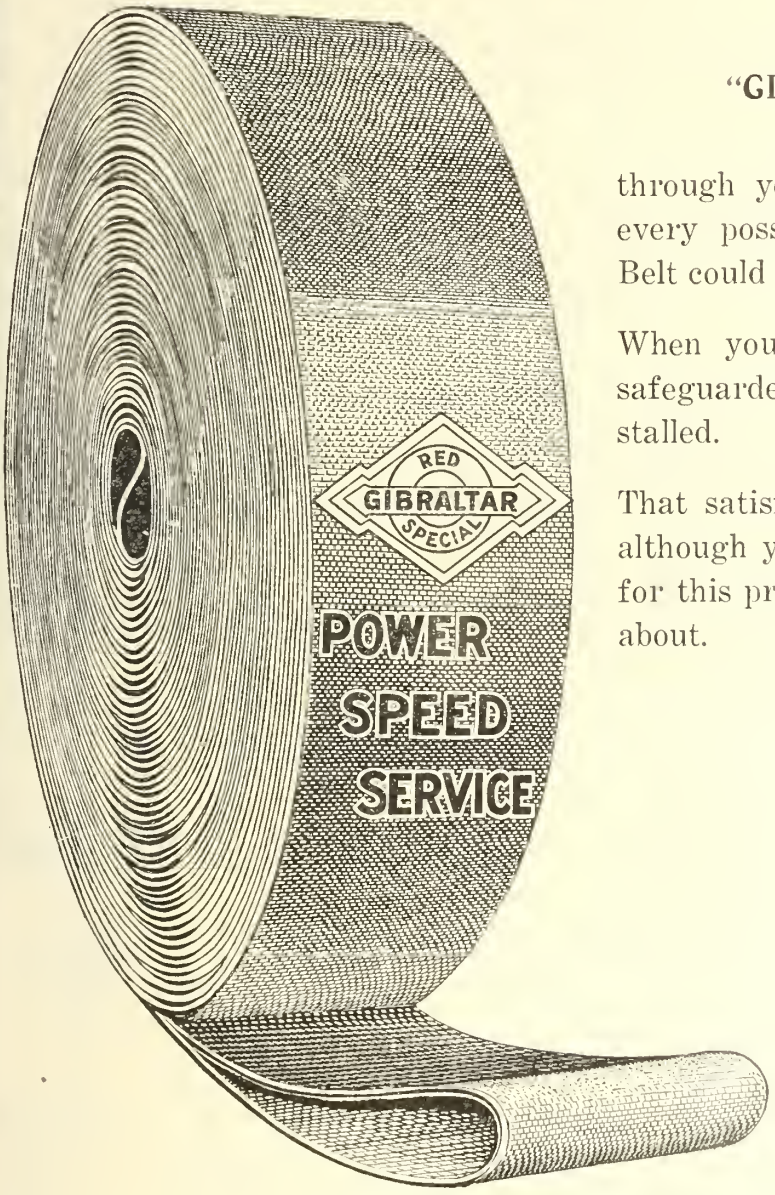
Efficiency in Belt Performance

The one thing you want to feel certain about in your Belt Purchases these days—when so much depends on the ability to lower costs and maintain quality—is efficiency in Belt Performance.

That "efficiency" has been built into

DUNLOP

"GIBRALTAR REDSPECIAL"



through years of Belt-making experience for every possible use to which a Transmission Belt could be put.

When you buy this Belt your interests are safeguarded from the very first moment it is installed.

That satisfaction alone is worth considerable, although you don't have to pay one cent more for this proven Belt than one you are doubtful about.

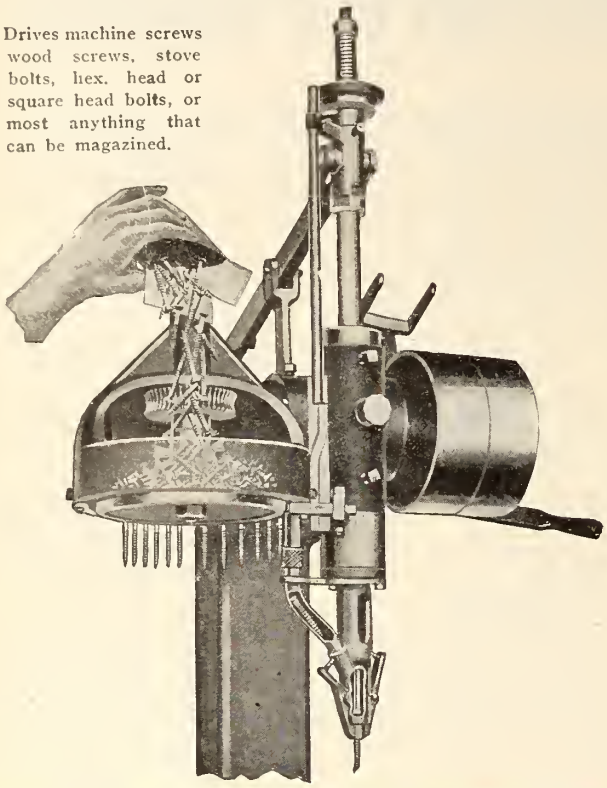
Head Office and Factories: Toronto Branches in the leading cities

The Demand is for Lower Prices!

Drives machine screws wood screws, stove bolts, hex. head or square head bolts, or most anything that can be magazined.



Reynolds Automatic Screw Driving Machinery will help you meet the demand

Everywhere the manufacturer is faced with the problem of price reduction. How can he find the solution?

By cutting out every waste—of time, labor materials, etc.

Many manufacturers have installed Reynolds Screw Driving Machinery for this reason. It accomplishes the work-better in one-third of the time.

Consequently they are able to meet the demand for lower prices and hasten the return to normal buying.

Are you interested? Then write us to-day for the full facts.

Send us dimensions over all of your work and gauge and length of screws driven so that we can determine the proper size and type machine to meet your requirements.

A Machine of Many Uses

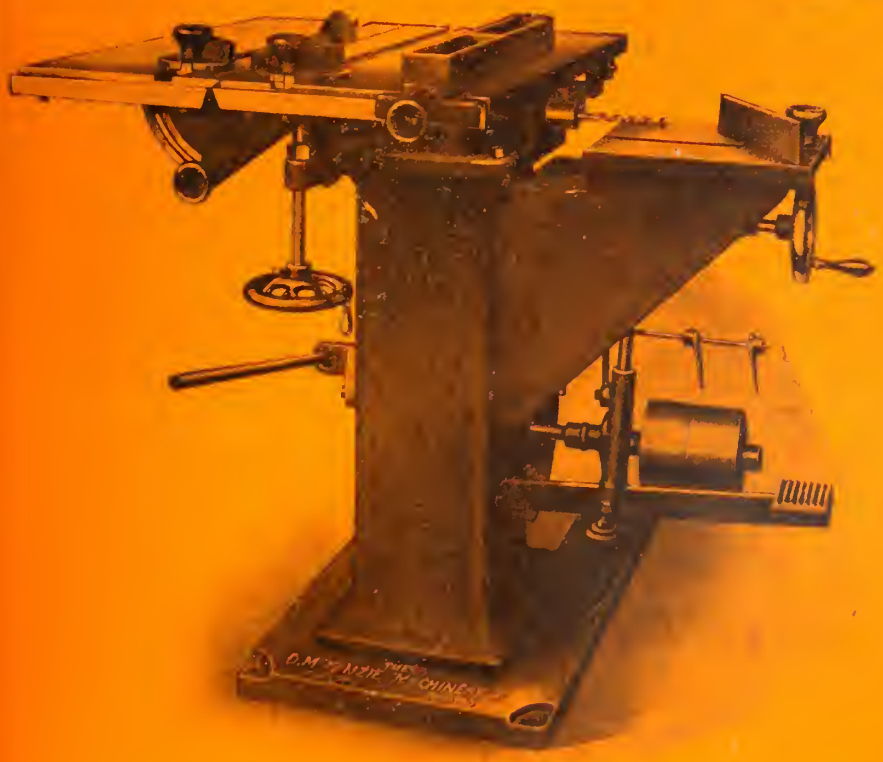
Cross-Cut, Mitre and Rip Saw, with Split Tilting Table and Boring Attachment

NO mill or factory can employ this machine without effecting a worth while saving in time and money.

It is a machine of wonderful adaptability on light or general work. The best materials are used throughout and it is very rigid and strong.

The illustration at the right shows the Cross Cut, Mitre and Rip Saw, while the lower cut shows the Split Tilting Table and Boring Attachment added.

We can thoroughly recommend it to anyone in need of such a machine and will gladly forward prices and full details upon request.

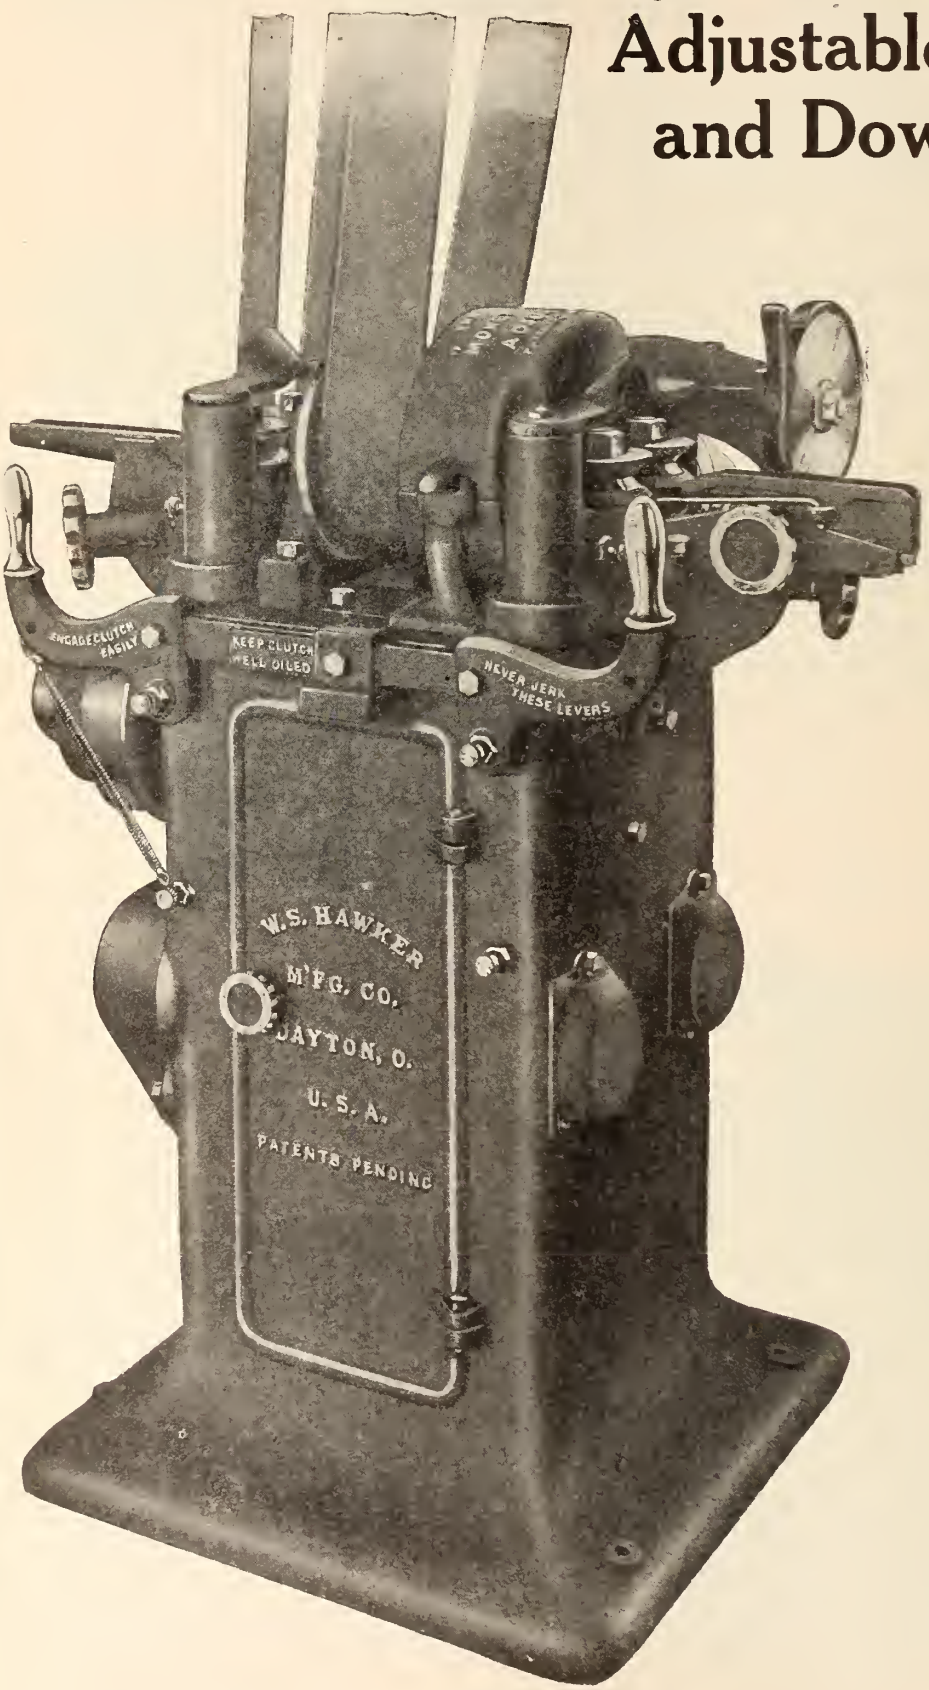


We specialize in 16 in. Back geared Crack Shaper, 14 in. x 6 ft. or 8 ft. Engine Lathes, Bench and Pedestal Grinders, Power Hack Saw Machines, Bench and Column Sensitive Drills and Saw Tables. Special Machinery built to order.

D. McKenzie Machinery Co.

Guelph - Ontario

The Money Maker—
Adjustable Rod and Dowel Machine



Capacity 30,000 to 40,000 lineal ft. per ten hours on 7/8 or 15/16 mop or sweeper handle stock.
If you are using any dowel machine of less capacity, figure your daily losses in labor and business.
Write us what dowel sizes you turn, and whether hard or soft wood. Ask for our demonstration proposition to show you how to double your production of dowel stock at the same labor cost.

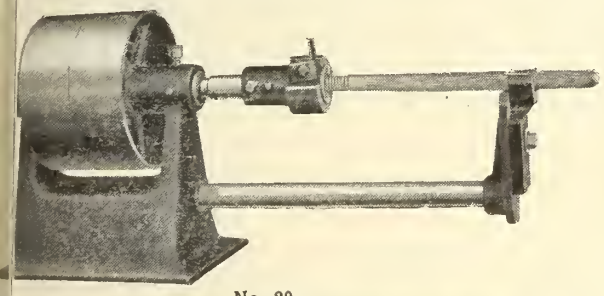
The machine that is sent under a guarantee to show you a gain of from 100 to 400 per cent before you buy it.
The improved dowel machine that 90 per cent of the largest and oldest machinery builders and dealers now endorse and recommend in preference to the solid chuck machines they themselves previously built.
One cutter head turns from ¼-in. to 2-in. diameter.
Turns hard or soft wood equally well.
Handles heavy, oversized squares.
No choking of the cutter head.
Smooth stock.
Accurate sizes.
Works stock as short as five inches.
Rolls automatically center variations in squares.
Machines built to turn from ⅛ to 6-in.
We want to hear from every user of a solid chuck dowel machine.
We can save you from one dollar out of every two, to four out of every five that the operation of solid chuck machines costs you.
Engagements for competitive test solicited.
Formal orders not solicited. All sales made after demonstration.

The only question is, are you willing to cut cost of your dowel turning to one-half or one-third of what it costs with any make of solid chuck machine?
Machine delivers the goods before you buy.
State conditions of stock closely
Special conditions require special equipment.

W. S. Hawker Mfg. Company, Dayton, Ohio

Improved Machines for the Woodworking Plant

Rapid Thread Cutting Machine for Wood Work

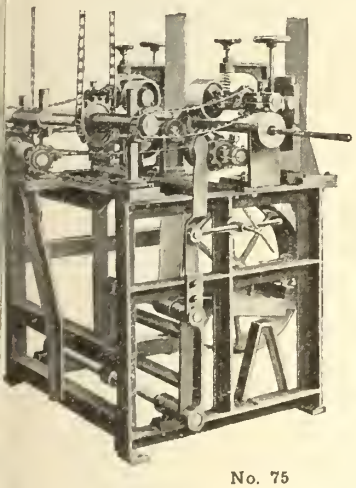


No. 20

This machine will cut threads in wood up to 2-in. diameter ell as all smaller sizes and do the work easily and with great d.

It is used for threading the ends of all kinds of handles such Mop, Broom, Brush, Sweeper and similar work, and will cut n at the rate of from 20 to 30 per minute. Also used for tapping.

The Rapid Automatic Sanding and Buffing Machine



No. 75

It Sands Turned Stock

70 Lineal Feet a Minute with a Finish Like Glass.

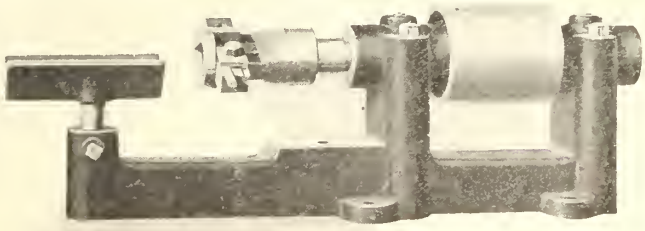
as the immense capacity that insures bed rock cost on all kinds straight and irregular stock from 20-in. long up to any length, from ¼ to 1¾-in. diamettr.

The stock revolves so rapidly that only No. 00 sand cloth need used, producing a surface smooth as glass. And a high-grade sh helps to sell your product.

The Rapid is practically fool proof, and is so easily operated t a boy can run it. In many shops it is replacing other makes sanders.

I am ready to answer questions and prove my claims

Rapid Chucking and Topping Machine

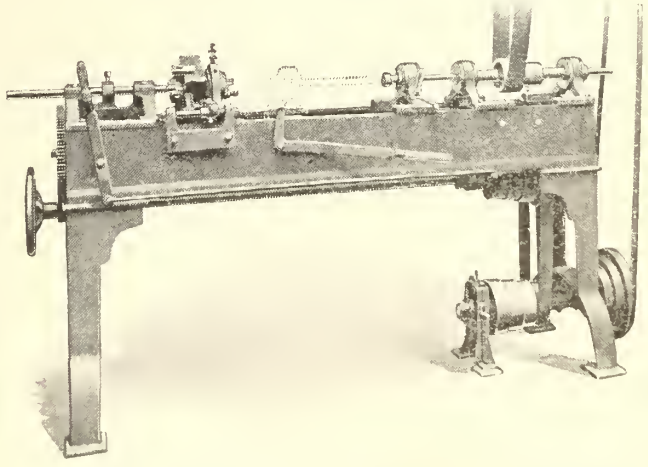


No. 31

Handle as chucked by above machine and ready for threading

Get descriptive matter—and for all kinds of machinery for handle turning, sanding and varnishing, as well as Automatic Machinery for Fancy Turnings.

No. B 42 Automatic Lathe



This improved Lathe is fitted up thruout with S.K.F. Self-aligning Ball Bearings, which do away with all mandrel trouble and effect a saving of 40% in power. The Ball Bearing Eye does away with all friction on the wood after it has been turned round with the roughing knife and for this reason, all kinds of woods can be Turned on the Self-feeder, including hard maple; there is no friction whatever, as the stick is tight in the Ball Bearing and revolves with this Bearing so the stick CANNOT BURN or heat the Bearing.

The No. B 42 Lathe is a Machine that you have long felt the need of and upon request, will be glad to send you descriptive matter and samples of the work done on this improved Machine.

The Future

What of the Future? Our insistance on the best--better machinery, better methods, better co-operation, better service --this justifies our optimism of the Great Future which is on the horizon. The tide is already turning, the Gates of Business are opening wide, we must be out in the limelight with up-to-date methods, scientific production, unfailing application and general co-operation. The Future is within our grasp--now!

If it's Machinery—write "Williams"

Excerpts from a booklet by
The H. K. Ferguson Co., Engineers and Builders

Advertising and Construction

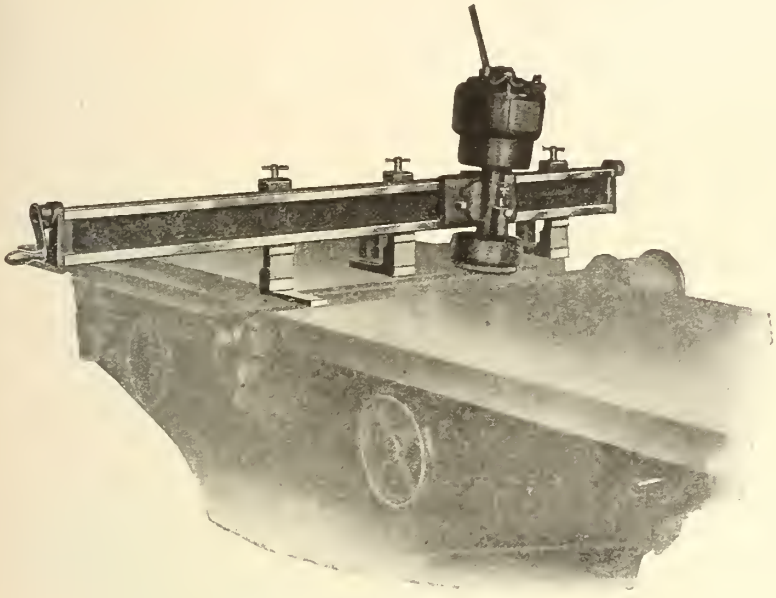
An actual and definite relation between the two

The past twenty-five years, marked by the ever-increasing application of the force called advertising to a wider and wider range of business problems, have, of course, built up a growing fund of general information with regard to the effects of advertising.

We have all recently seen the publication of figures indicating that 84% of all business failures in 1920 were of concerns which failed to advertise. An analysis of the factory-construction records of my own company shows that 83¾% of our customers are advertisers.

Stated differently, the figures indicate that the manufacturer who advertises is five times as likely to stay in business as his non-advertising competitor, and is five times as likely to need more factory space which he will probably buy in two and one-half times the quantity required by the non-advertiser.

QUICSHARP TRADE MARK Grinder



Method of attaching to Jointer

Summarizing some of the Features and Advantages

The knives are always in perfect alignment with the bed and with each other, making each knife do its share of the cutting, thus insuring smooth and accurate.

Machines will take care of from 25 to 40 per cent. more work than with the file and oil stone method, and with a reduction of one-half in the cost of knives.

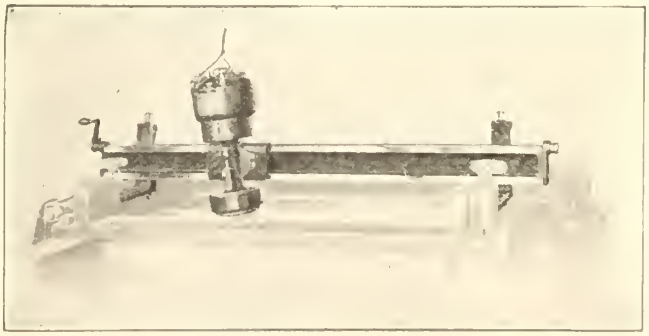
Harder knives can be used than is possible with the old method of whetting knives with a file and oil stone.

With cylindrical head planers the knives are so thin and flexible that it is difficult to grind them on an automatic and put them back on the machine in perfect alignment. A great deal of time is used up adjusting knives. With the Quicsharp Grinder, knives are ground to a keen edge right on the machine in ten to fifteen minutes. The tilted head grinds knives slightly concaved, giving a stronger and freer cutting edge; this, not only means more work, but a tremendous saving in power consumed. With a Quicsharp Grinder in the shop there is no excuse for idle machines. If a nail or gravel stone is run into, usually, instead of having to take off the knives and adjust a new pair, a few minutes with the grinder will clean up the gap and work started again without any serious delay.

A pair of knives once put on a machine are not usually taken off until worn out.

The constant pressure tension spring holds grinding wheel against knife with a uniform pressure and prevents all possibility of burning of knives.

If one man takes charge of the grinding of knives, using Grinder once a day, knives will be in better shape than the most expert operator could keep them. The care and adjustment of knives is the most important part in the operation of planers. This inexpensive grinder does all that the costly automatic does, and much more. It occupies no floor space, gets its power from a lamp socket, is simple and durable.



Method of attaching to planer

It will save its cost many times over

Stockbridge Machine Co., Worcester, Mass., U.S.A.

The Preston Woodworking Machinery Co., Ltd., Preston, Ont., Canada

WORKS LIKE A CHARM

the new

GLUE SPREADER

IN actual performance this new Plate Joint Glue Spreader has proved that it can more than double the production of Clamping equipment.

The operator presses the foot lever down, raising the perforated plate up out of the glue. Then by resting the edges of the stock on the plate and moving them backward or forward slightly, the edge will be evenly coated with the required thickness of glue. The release of the foot lever allows the plate to sink back to be impregnated for the next batch of stock. The tank is 5 inches wide and 5 inches deep. Perforated plate is 4 inches wide, $\frac{3}{8}$ inches thick and 1 inch shorter than tank. Self Acting steel cover supplied to order.

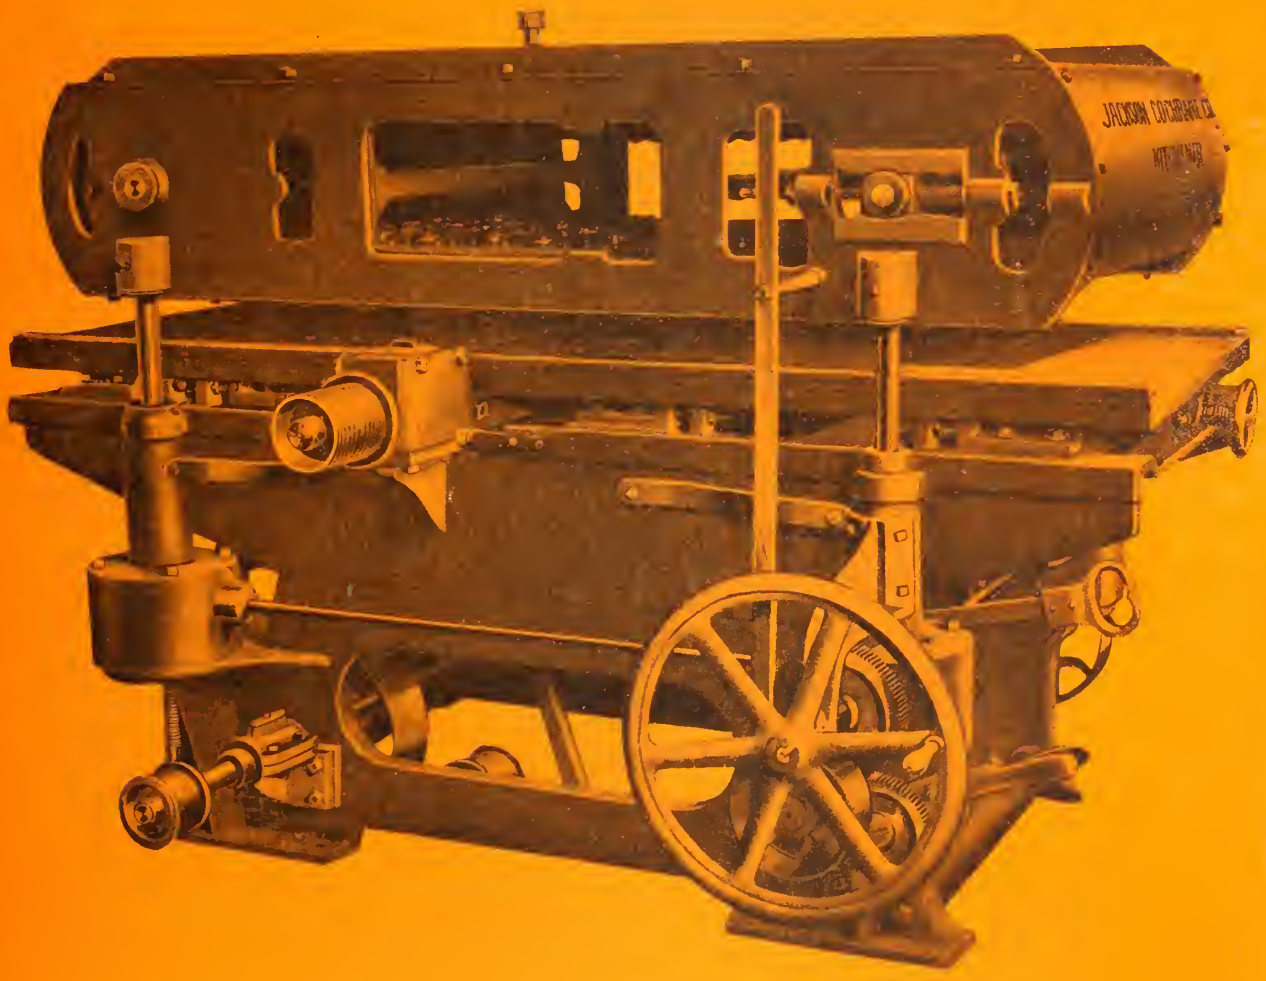
KITCHENER - CANADA

"HERZOG" SELF-FEED JOINTER



Two Boys Could Operate this Jointer for You

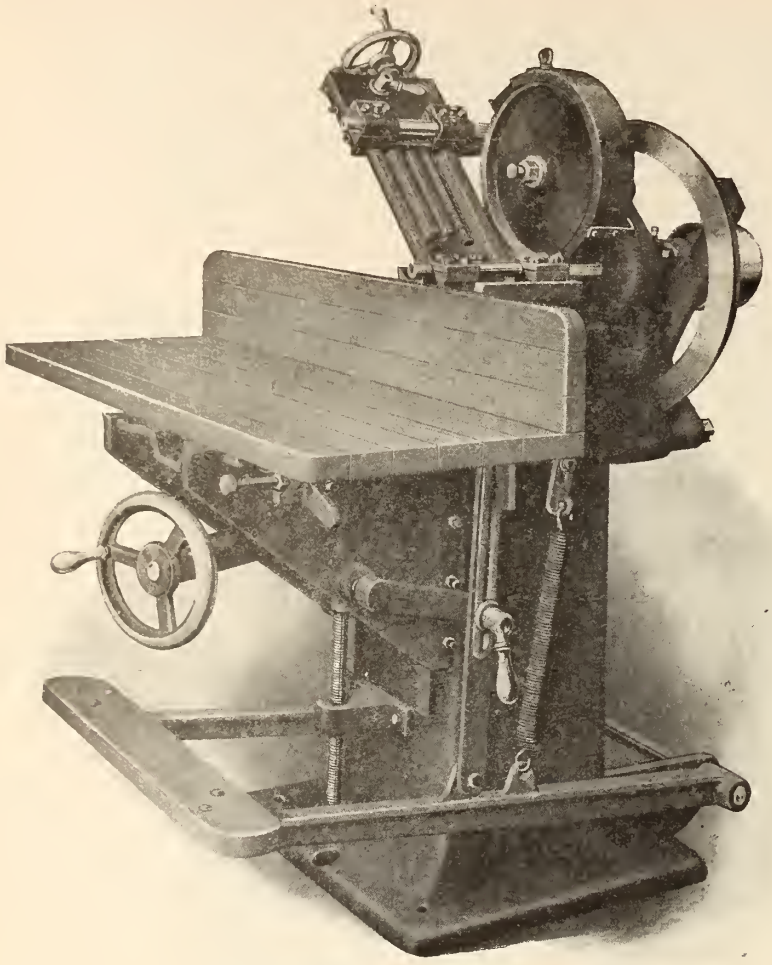
Think what a saving that would effect in your shop—two boys doing the work—better—and from three to five times faster than hand jointers. Such efficiency is made possible by the many splendid qualities the machine possesses, its simplicity of operation, its ruggedness of construction and its ability to work at high pressure without frequent breakdowns.

The Herzog Self-Feed Jointer handles stock varying in width from 1 inch to the full width of the machine. It will operate at fast or slow speeds while the knives require about one-fifth the attention given hand jointers.

We would like to send you full particulars and prices. May we?

Jackson, Cochrane & Company

KITCHENER - CANADA

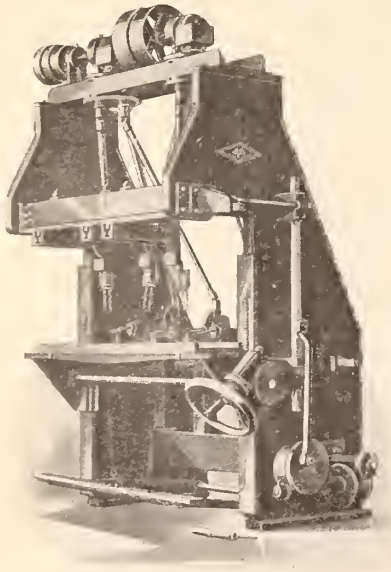


Double Spindle Radial Boring Machines
Built in two sizes
No. 1—To bore from 1¼" minimum to 18" maximum centers.
No. 2—To bore from 1 " minumum to 12" maximum centers.

Valley City Boring Machines

Lead The Way

This is the standard of the furniture manufacturing world. The machine is finished with accuracy and combines versatility with never failing reliability. The TABLE is actuated with a central connecting rod—preventing the bureau drawer effect. The large INTERMEDIATE GEAR is supported at any position by the large segment on the rear of the column—the machine has a backbone—eliminating the vibrations set up by the action of the teeth and prolonging the life of the spindles.



Double Direction Boring Machine

A new CLOSE CENTER ATTACHMENT has recently been perfected which is universal and will bore two 5/16" holes anywhere in a circle of 1¼" with minimum centres of ½".

The new QUICK ACTION CLAMP attached to the fence eliminates the old stick.

The New Double Direction Borer

was created to take care of the needs especially of the Chair Manufacturer. It bores horizontally and vertically and at ANGLES. Feeds are independent and selective. Remember we can bore all the holes you have in any piece with one operation if you want to

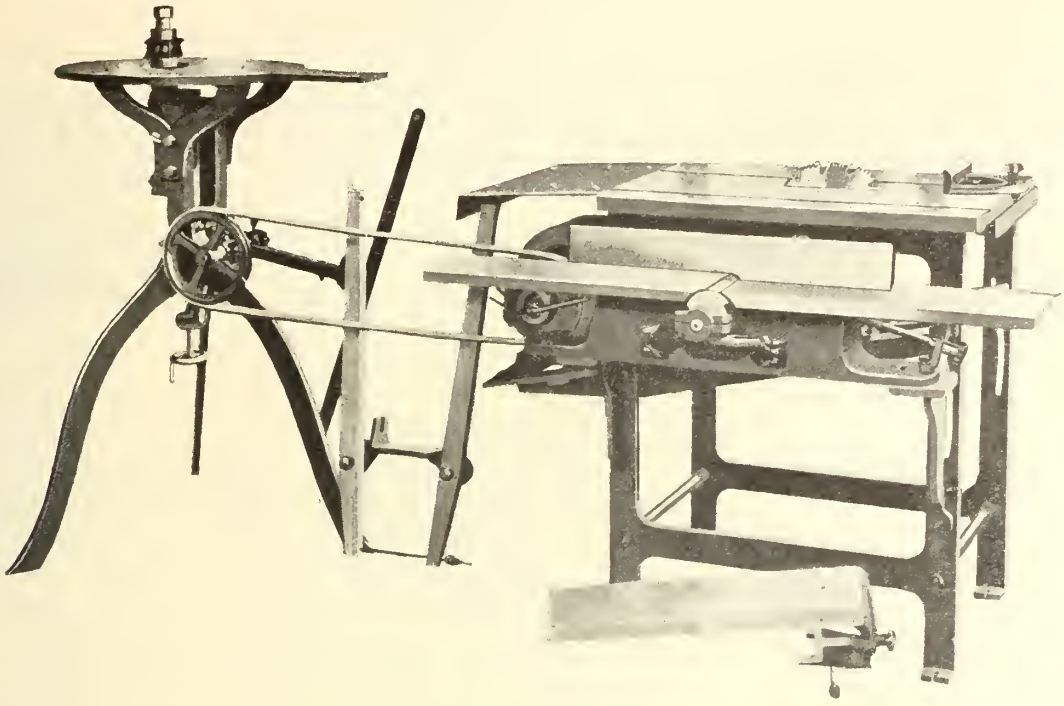
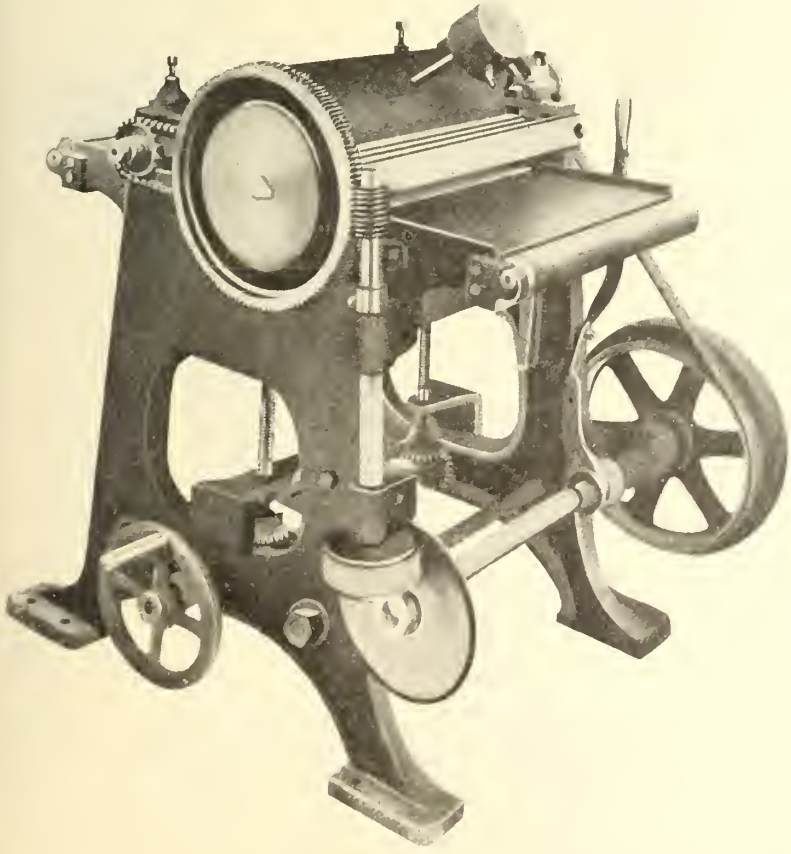
Valley City Machine Works

Campau Avenue and Fulton St. N.W. Grand Rapids, Michigan, U. S. A.



Our New No. 7 Woodworker

A compact, reliable machine that is particularly adapted for shop or factory use.
Our Combination Scroll Saw & Shaper can be run from the same Motor.
Motor supplied, if required, to run from lamp socket.
Notice the Jointer is on the front of machine so the operator does not change his position to rip or joint.
Put this machine in your bench room and save time running to the big machines.



The Elliott Bull Dog Planer

6″ x 16″

The facts that the head is run by a worm gear; no pinions on the head and that the feed rolls are driven independent of the head excludes vibration. Hence—it planes smoother than any other Pony Planer made. Also it uses less power.

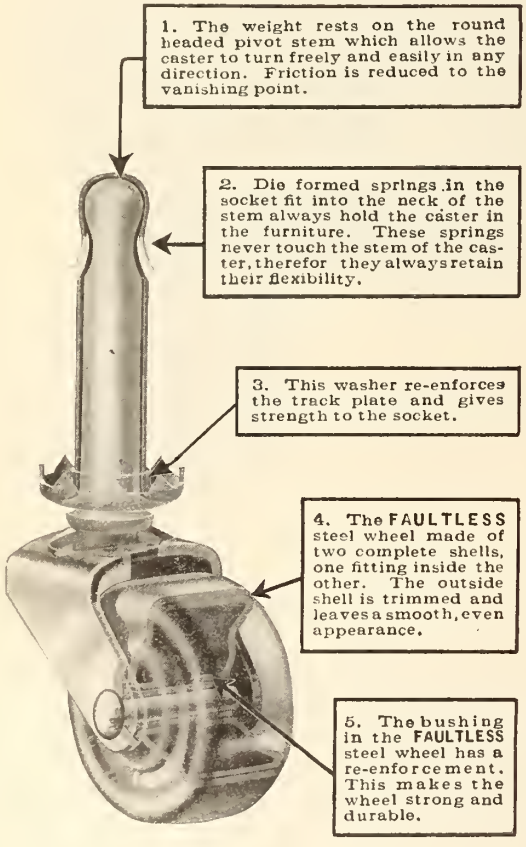
FAULTLESS CASTERS



1. The weight rests on the round headed pivot stem which allows the caster to turn freely and easily in any direction. Friction is reduced to the vanishing point.
2. Die formed springs in the socket fit into the neck of the stem always hold the caster in the furniture. These springs never touch the stem of the caster, therefor they always retain their flexibility.
3. This washer re-enforces the track plate and gives strength to the socket.
4. The FAULTLESS steel wheel made of two complete shells, one fitting inside the other. The outside shell is trimmed and leaves a smooth, even appearance.
5. The bushing in the FAULTLESS steel wheel has a re-enforcement. This makes the wheel strong and durable.

Swivel easily and quickly—rolls at a touch. Their simple construction is most pleasing, their smart design is most appealing and enhances the beauty of your furniture.

REPAIRS

Be sure that name of owner appears on each saw, and mail full instructions of work to be done, stating the hand, speed, and feed of mill together with shipping directions for return of saws.

THE Radcliff guarantee provides full protection to the purchaser of "Beaver Brand" Saws and is some indication of the pains taken in their manufacture in order to live up to the guarantee. These saws are made from the finest grade Crucible Steel—keen cutting and strong. They retain their tension and cutting edge longer than any others.

Let us send you the Radcliff catalog and price list containing just the information you want.

Radcliff Saw Manufacturing Company, Limited

1550 Dundas Street West, Toronto, Ontario

Agents for L. & I. J. White Company Machine Knives

IN 1890 C. L. Willey founded at Chicago what soon grew to be the largest veneer manufacturing establishment in the world. The company was launched on the platform of unvarying quality, a policy from which it has never deviated. Due to the death of C. L. Willey, five years ago, and the subsequent death of his son, Charles B. Willey, the present organization was effected last spring for the purpose of sustaining the business on its plane of acknowledged supremacy, and keeping intact Mr. Willey's traditions of sound, clean business practice. The fame of C.L. Willey as the largest manufacturer of fine veneers in the world finds expression to-day in the institution he founded and will permanently endure through the active administration of that institution under the Willey name.

The extensive and perfectly balanced battery of highly efficient veneer-cutting and drying equipment will function as always. The warehouses will continue to exhibit that scrupulous orderliness and cleanliness which have always made Willey veneers notable for their bright and undamaged appearance. The exceptional facilities for handling and caring for orders that so greatly contributed to the Willey prestige will be maintained and extended. The extensive log organization, which became famous under Mr. Willey's tutelage, will continue.

The C. L. Willey Company is a going concern, financially sound, with a thoroughiy organized sales force and experienced artisans trained in its factory, and will continue to turn out an exceptional quality product in hardwood veneers and lumber from walnut, mahogany, circassian, quartered oak, English oak, poplar, satinwood, vermillion, teak, rosewood and other foreign and domestic species.

The plant is located at 2558 S. Robey Street Chicago, and is splendidly served by the C. B. & Q. railroad and in addition by its own slip on the south fork of the Chicago river, an ideal combination for both rail and water transportation.

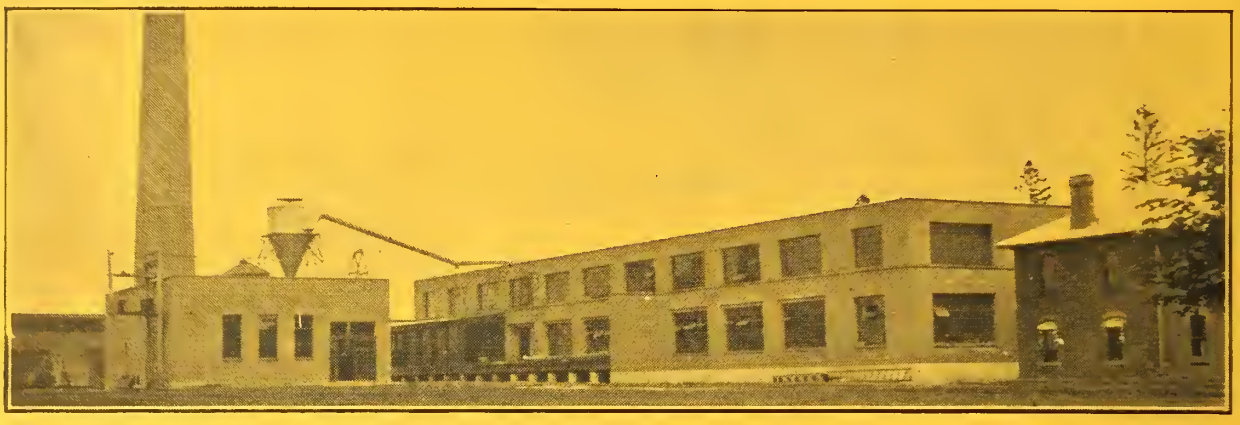
Specialists in Ball Bearing Woodworking Machinery

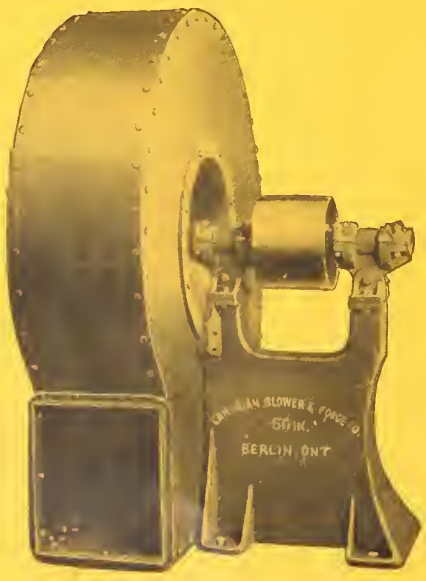


General view of office, plant and power house, Langslow, Limited, Cobourg, Ont.

"Modern Methods"

as applied by

Langslow Limited



IN the erection of this large modern, daylight furniture manufacturing plant nothing was overlooked that would reduce production costs and improve the quality of the work.

They were not satisfied with any kind of a shaving exhaust system, but secured the services of our experienced engineers who make a specialty of this work.

The result is a system which is not only efficient as far as removal of the refuse is concerned, but requires a minimum amount of power to operate.

When another building was added and a second system wanted, it was but natural that we should get the job, which is now being erected.

Our slow speed fans will save you money and our engineers are ready to give your plant the same advantages. Why not write us for full particulars?

Made of Canadian Birch

Supplied by Edward Clark & Sons, Ltd.

THIS splendid example of Canadian craftsmanship from the shops of John C. Mundel and Company, Elora, Ont. gives a good idea of the type of wood we manufacture and supply to many of the leading Furniture Manufacturers in Canada and the United States.

As the mills are not sawing the quantity of Hardwood lumber this year that they have been accustomed to manufacture in the past, we strongly advise you to place your order at the present prevailing prices which we firmly believe are the absolute rock bottom. A very good plan is to place an order for your requirements for the next six months, giving instructions as to the various shipping dates. This policy is being followed by the larger manufacturers.

Efficiency Courtesy and Service.

WE ARE TELLING THE PUBLIC: "BE SURE YOUR WALNUT IS REAL WALNUT."

AMERICAN WALNUT

"The Cabinet-wood of the Ages"

WE ARE TELLING THE PUBLIC: "BE SURE YOUR WALNUT IS REAL WALNUT."

SALES AMMUNITION:

Our "All-America" campaign for American Walnut *Trade Extension* through advertising is furnishing alert manufacturers and dealers with innumerable selling arguments. The *Walnut facts* alone are what clinch the sales. The best public is "all for American Walnut."

In all of our advertising, including the beautiful series of four-color illustrations in the leading magazines, we are continually driving home the long list of American Walnut's simple and enduring virtues—rich *natural* color, supreme stability and strength, easy working properties, and *unfading* beauty. No stain is needed to produce the royal elegance of warm browns so coveted by the best trade.

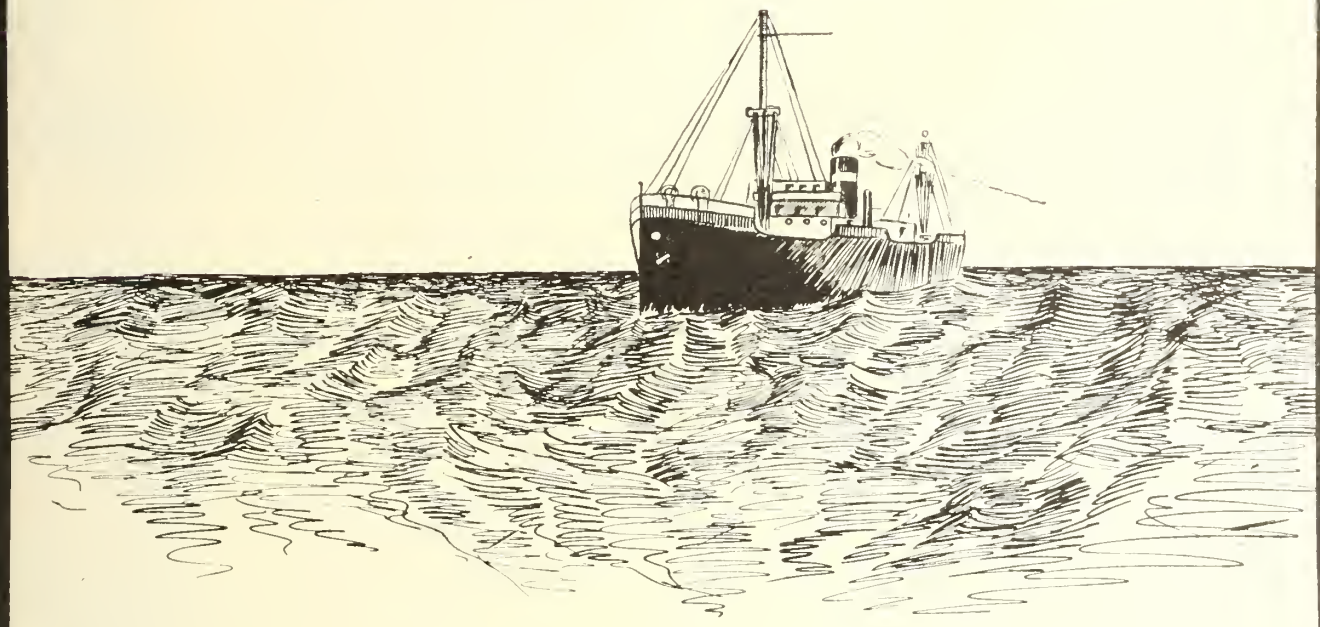
One of the chief causes of the steadily rising demand for American Walnut furniture and interior trim is its faculty for *growing in beauty with the passing of the years.*

"The Cabinet-wood of the Ages" is a true phrase.

Our Walnut Brochure, de luxe, is filled with ideas and suggestions of interest and value to the trade. A request will bring it, with our compliments.

AMERICAN WALNUT MANUFACTURERS' ASSOCIATION

ROOM 1019 616 SOUTH MICHIGAN BOULEVARD CHICAGO, U. S. A.



On October 17, 1906 the S. S. "Corinth" sailed from Axim, Gold Coast, Africa, to Pensacola, Florida, with the first full cargo of mahogany logs ever shipped from the continent of Africa.

Prior to 1860 complete cargos had sailed from Africa, but the holds were laden with human freights from which was manufactured the great American Civil war.

From the valuable cargo aboard the "Corinth" was produced the beautiful and the useful—a contribution to the prosperity and civilization of America.

To the successful venture of this pioneer ship is largely due the position and influence of African Mahogany in the wood artistry of today.

It is immaterial that the Mengel Company were the operators of this ship and the owners of this cargo.

NATIONAL DRY KILNS

"The First Kiln in 6,000 years in which Humidity is Automatically Controlled"

Personal Service

the link
between
the maker
and the operator
of "Nationals"

Mr. C. A. Fields
Our Canadian Representative

Service is the first essential, we believe, in the successful execution of our business. Personal service enables us to keep in close touch with the growing family of National Dry Kiln operators in Canada.

It is our duty and our pleasure to co-operate with you for greater efficiency in Kiln operation whether you now have one of our installations or not. This we are ready to do through the person of our Mr. C. A. Fields.

Mr. Fields will be happy at any time to call upon you and discuss the question of improved kiln drying in your plant.

THE NATIONAL DRY KILN COMPANY

"NATIONAL" SUPERIORITY

Uniformity of Temperature and Humidity

YOU probably have in mind something of the detail of some of the ordinary piping systems. We illustrate one of them at the bottom of the opposite page. This is one which we used for some years before we learned better. You will note that steam enters at one end of each coil and drainage is arranged at the other end. The pipes are laid in two horizontal rows and are usually supplied through one or two supply pipes.

Experience and tests in kilns so equipped demonstrate that there is a difference in the average kiln of several degrees between the two ends of the kiln. The exact difference varies considerably, depending upon whether steam is turned "full on" or not. However, even when "full on" a difference of 9% or 10% is usual. In other words, when you have (say) 147° at one end of the kiln, you will have 133° at the other end.

Ordinarily the steam spraying system is such that fairly uniform wet bulb temperature is secured. Assuming this to be (say) 126°, we find that your relative humidity varies from 54% at one end of the kiln to 79% at the other. In other words, the drying power is 1.46 times as great in one end as in the other.

This explains why a kiln equipped in this manner will dry some part of its charge of lumber perfectly, and case-harden, honeycomb and check other parts of it. It explains why, after part of the lumber is dry, you often have to wait days for the balance to get dry.

On the chart shown opposite we have tabulated the variation in temperature and humidity which occurs during the four normal periods of lumber drying. Note that during the primary period, when you desire 100% humidity, with the old type of equipment, it may be raining in one part of the kiln and lumber may be drying in another part, neither of which is correct.

During the initial drying period, in which the lumber generally contains considerable free moisture, it is best practice to use about 85% humidity, yet with poor equipment the operator may still find it raining at one point and too low humidity at another. And so on through the process, the operator constantly finds himself badly handicapped by the exceedingly unequal drying power of the air.

We provide for uniform distribution of heat in our compartment heating system, arranging it in the manner indicated by the diagram at the top of the opposite page. **Distribution is secured by making every run of pipe do the round trip, from one end of the kiln to the other and back again. This makes the average efficiency of the radiation the same in any cross-section.** The hotter part is parallel with the cooler part. This arrangement gives uniform heat throughout the length of the kiln. This is an exclusive feature of NATIONAL kilns.

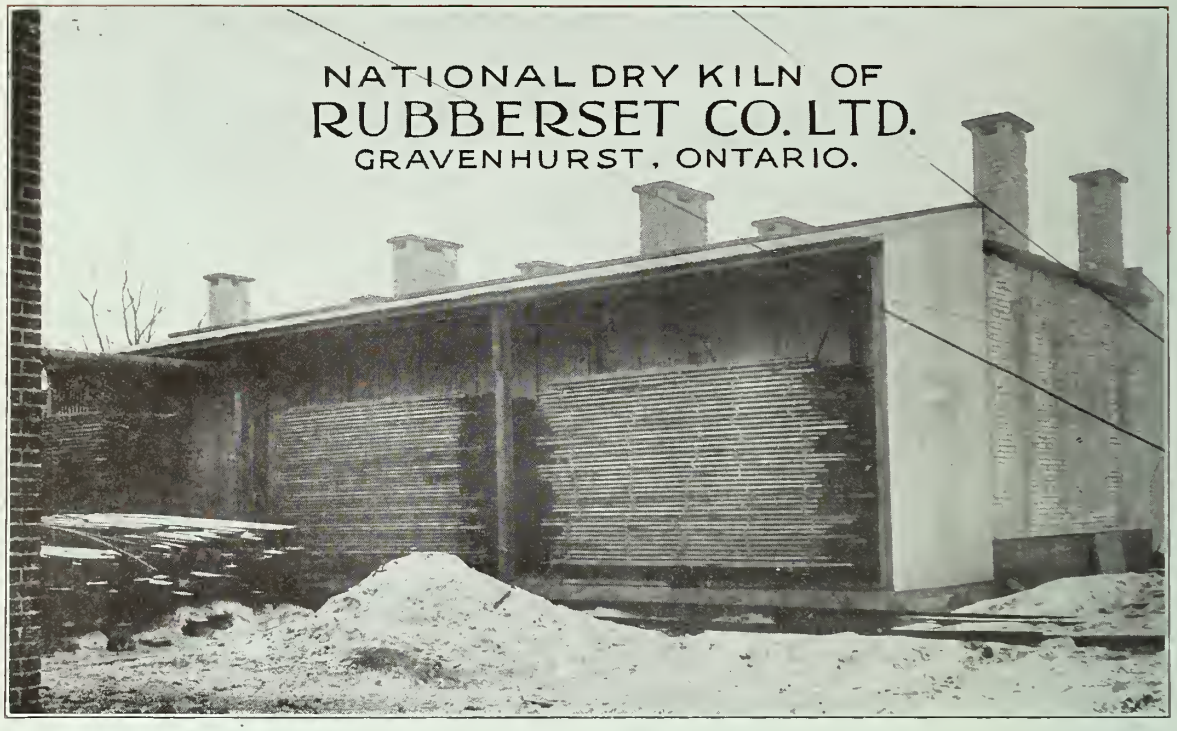
This letter proves the old adage in a very convincing manner. Similar letters from other Canadian firms using our equipment give further proof of the superiority of National Dry Kilns and the advisability of using the correct basic principles in making an installation of this kind.

THE NATIONAL DRY KILN COMPANY

1117 East Maryland Street, Indianapolis, Indiana

C. A. FIELDS, Canadian Representative, P. O. Box 55, Toronto

NATIONAL DRY KILNS



Installed in 1920

"Anything worth doing is worth doing well"

This letter proves the old adage in a very convincing manner. Similar letters from other Canadian firms using our equipment give further proof of the superiority of National Dry Kilns and the advisability of using the correct basic principles in making an installation of this kind.

The National Dry Kiln Co.,
Indianapolis, Indiana.

Gentlemen:

It gives me great pleasure to inform you that our National Kilns are working perfectly in every particular.

As you know, our kilns are equipped with all your automatic control devices, such as the automatic water supply tanks, dry bulb thermostat, wet bulb thermostat, scalo meters, recording thermometers, door carriers etc.

I thought, when installing the kiln, that some of the above were superfluous, but I can assure you that I would not think of doing without any one of them now. We have been operating our kilns for about two months, and find them to work better every day.

With the full information you give, along with the blue prints for installing, anyone who can read should have no trouble putting in the equipment.

We have just had all the pipes leading to the kiln covered with Johns-Manville insulating preparation, which we find is a great saving in heat.

I shall be pleased at any time to give you any information you may desire about our kilns.

Very truly yours,

Rubberset Company, Ltd.,
Gravenhurst, Ontario,
Per J. J. McIntosh,
Superintendent.

Why Bruce Hardwoods Excel

For many years before we became hardwood lumber manufacturers, we were makers of fine Oak Flooring and are to-day the largest individual producers of that material.

The producing of good Oak Flooring is an exacting science—where perfection is attained—and teaches the value of both skilful grading of raw material and accuracy in milling.

With a full appreciation of the value of these factors, we entered also upon the manufacture of southern hardwoods and in the operation of this department, have applied them in the production of all items in white and red oak, gum, ash and other species.

With our joint facilities, we are equipped to ship square edge parquetry strips, oak trim and mouldings, as well as Oak Flooring in the same car with hardwood lumber.

Inquiry and correspondence invited.

Vol. 22 Toronto, February, 1922 No. 2

What is the Basis for Lower Prices for 1922?

In making the February issue of the "Canadian Woodworker and Furniture Manufacturer" a special "Modern Methods Furniture Number," we believe we are suggesting the foundation for lower manufacturing costs in furniture factories and in woodworking plants. During the last decade woodworking methods and equipment have undergone vast, even startling changes; system has been applied to manufacturing operations, factory organization has been introduced and new types and designs of equipment evolved, with the result that to-day it is possible with modern methods to increase output, reduce costs and, at the same time, improve the quality and finish of the product.

It has been said, and truthfully, that woodworkers as a class are conservative, too conservative for their own best interests. They are too prone to cling to old theories, old methods and old equipment and as a result have failed to keep pace with the progress and development in their own field. This may have been alright in the past but it will not do for the present. To-day we are faced with a new set of conditions and whether we desire it or not, increased efficiency is becoming absolutely necessary, is, in fact, being forced upon us.

A struggle for business supremacy will, it is predicted, be witnessed during the year on which we have just entered. Throughout the coming months, all business offering will be more strenuously contested for than during 1921 and preceding years. In this contest honors and profits will go to those manufacturers who, for the least money, have the most to offer in the way of goods, services and deliveries; in other words, the successful ones will be those who can sell the cheapest at a profit.

The last phrase "at a profit," is not without its significance. In the furniture and woodworking industry there is a marked tendency to forget profits and cut, cut, cut, in an effort to overcome competition and secure sufficient business to keep plants operating on something approaching a normal basis. This is due partly to a lack of cost knowledge and partly to the fact that, in this important industry, salesmanship has degenerated to competition in price-cutting. This is to be deplored. It is a basic economic principle that all business should show a profit.

Present values in the furniture and wood fabricating industries are sound inasmuch as they are based on present-day costs figured on replacement values and with profits reduced to a narrow margin. This does not leave much room for price manipulations and reductions. If lower prices are necessary to maintain prestige, overcome competition or secure business, there is only one justification for bringing down values—decreased manufacturing costs. The basis for lower prices for 1922 must be increased efficiency.

Reference has been made in one of the preceding paragraphs to new and improved equipment. Some of these developments are touched on in articles appearing elsewhere in this issue. Descriptions will be found of saws which do the work of many old-time machines, double-end tenoners which end-tenon and dimension at fast rates, high speed shapers with greatly increased output, clamp carriers, double mitre saws, shaping lathes, sanders and finishing and veneer room equipment. The purchase of modern equipment of these types can hardly be classed as an expense. Many of these machines will, if given half a chance, pay for themselves in a very short period. All will tend to lower manufacturing costs.

It is hardly to be expected that any manufacturer will scrap all his present plant and replace it with modern machinery, though such a move would prove a revelation to many woodworkers. There are, however, weak spots in every factory which should be sought out and strengthened. A new machine here, a slight change there, often works a startling change, resulting in higher production and lower costs. Was it not Andrew Carnegie who said that a manufacturer should re-invest his profits in his own business rather than in a field with which he is not so familiar? Money placed in new equipment will pay handsome dividends and lead to still further expansion and growth. It is best to make a thorough study of all operations and every detail of the manufacturing process, outline a programme of improvement and development and then follow it persistently and consistently.

In striving for greater efficiency other phases of activity such as management, merchandising, factory organization, labor problems and purchasing should each receive attention. In connection with the buying of raw materials, supplies and equipment, the advertising pages of this and every other issue of the "Canadian Woodworker and Furniture Manufacturer" afford an interesting study. One Ontario manufacturer recently stated that making a practice of reading trade journal advertising has given him many new ideas and has been the means of saving him thousands of dollars. The educational side of advertising is often overlooked, yet many good practical ideas are to be found in other than the strictly reading pages. Would it not be well to scrutinize every page before you permit this number to leave your hands?

One good habit is better than a dozen rules. The safety habit is a good one.

Straight line handling: Railroad, then yard storage tracks, then kilns, then plant.

How to Save $3.00 per M. on Lumber Costs

Excessive Handling Adds to Cost of Lumber at Factory Door—Capacity of Kilns Automatically Increased—Overhead and Carrying Charges Drop—Lumber Lift Aids Production in Breaking-out Department

By VICTOR J. JOSE, Jr., Indianapolis.

Only two handlings "from car to saw" of the individual board, is the modern plan in lumber handling. And this is not merely theory, but actual practice now in many plants, for example, the Marmon Automobile plant as shown above.

Of course, the conditions to be found in every plant present definite engineering problems. No lay-out can be prescribed as good for every plant. The location of the switch, from which the inbound lumber is handled, the amount of space available for storage tracks of the green lumber, and for storage tracks of the dry lumber after it comes from the kiln as well as the relative location of these spaces, determine the general plans of each particular layout. The right kind of a layout not only saves cost of handling, but is valuable in producing savings in the quality of the lumber and thus indirectly in the results in other steps of production. The wrong kind of a layout means non-essential labor, employment of unnecessary men and actual waste in degrade material.

In the Marmon plant the straight line idea is worked out and adopted in addition to the modern plan of piling the lumber directly on the kiln cars as it comes off of the railroad cars. The railroad switch is run across the end of a series of loading tracks. From the railroad car door they have three portable roller conveyors. As the man in the car picks up a board, he puts it on to one of the three, according to its length. At the door is the lumber grader who scales it and grades it, making his record as the board goes past. It travels down the conveyor to kiln trucks on one side of three loading tracks. In this way they load separate lengths on each truck, which has a decided value in producing less warping and better dried lumber. It also facilitates the handling in their cutting room. The method of grading saves them the salary of one grader and sometimes two.

All the lumber is loaded on to kiln trucks in this manner. After loading the truck, it is pushed on to a designated storage track between the railroad and the kiln. These tracks are known as "green storage" tracks, and each track is used for a certain kind and certain length of lumber. As a result, they have a veritable "yard on wheels," with everything separated so as to facilitate speedy and definite handling when they are ready to load a kiln.

One of the big advantages of this storage system is that it actually increases the capacity of the present kilns. It does this in the obvious way of permitting the lumber to dry while standing out on the track waiting, because it is all stuck with plenty of air spaces, just as it is to go into the kiln.

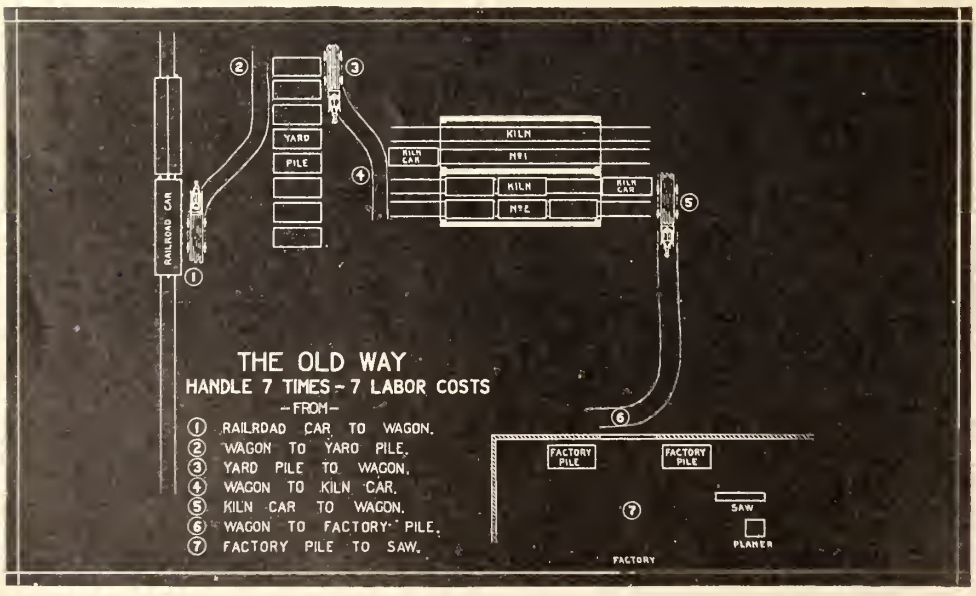

Fig. 1—Stock sometimes handled seven times before it reaches factory.

The more it dries there, the less moisture to be taken out in the kiln, and therefore, the sooner a charge goes through, leaving the kiln ready for the next charge. And, of course, it does lose more moisture, piled this way, than with the old methods.

But the big advantage is in providing a complete charge of lumber at all times whenever a kiln is emptied, without the usual wait for loading the required number of new cars. Few firms realize what a big portion of the time their kilns lie idle, due to this. When one charge is taken out, at many plants, the loads for the next one are being loaded and pushed in one at a time. This may take a day or may take three days, depending upon the weather, the size of the kiln, etc. But is should not take over 30 to 60 minutes. The cars should have been loaded either as in the above case, when the railroad car was unloaded, or, while the last charge in the kiln was drying; and should be standing on the green storage tracks ready. Pushing them onto a transfer car and into the kiln is a matter of minutes. The kiln then goes right ahead on the next charge.

Fig. 3—How two furniture manufacturers have applied this idea.

If the average time of drying a charge is ten days and three days are lost in loading and unloading, then in one month, at least six days have been lost on the two charges. Six days is one-fifth of the month; that is a loss of 20% and this is conservatively figured. The expensive building and all of its equipment on which are being charged overhead and other costs, is taking a vacation 20% of the time. Just take 20% of the fixed charges that are placed against the kiln equipment and see how many dollars are being wasted.

Then figure the amount that is paid for each handling of the lumber in labor costs, to say nothing of the costs due to breakage, improper piling in the yard, teams, hauling, extra men, etc. At least three of the handlings in Fig. 1 occur at the usual plant. The chances are that all seven occur in the average plant. In large plants, using efficient methods, the cost of bare handling is practically never below 50 cents a thousand when such items as overhead, superintending, etc., are taken into account. From that, the figure runs up to four or five dollars. At only $1.00 a thousand, if there are three excess handlings, it means that the product is being made out of material that is costing $3.00 a thousand too much. And if it costs more per thousand, the burden which the product is carrying is even more staggering. That burden follows it right on through to the point where it meets, in competition, the products of other manufacturers who have eliminated the unnecessary handlings—and of course gives them the advantage. The closer one can come to Fig. 2, the less the lumber will have cost when the saw cuts into it in the plant.

The lumber should come to the saw from the "dry storage" tracks, as shown in Figs. 2 and 3. The advantage of dry storage is two-fold: It increases the kiln's drying capacity by providing a space onto which all of the trucks out of a kiln can be moved at once upon completing the drying without waiting to unload any single truck. The kiln is not held up during long unloading periods. Another advantage is that a dry storage space enables one to always have dried lumber ahead of the daily production needs.

This last item is beneficial in many ways. It prevents delays, waiting for dried lumber in case of miscalculation, or of sudden increase in production. Most important and a feature which is assuming greater importance every day in progressive plants, the lumber is allowed to stand when it comes from the kiln. It is still separated by stickers and cools in a natural, normal way inside the plant under temperature and humidity conditions which are the same as those in other parts of the plant.

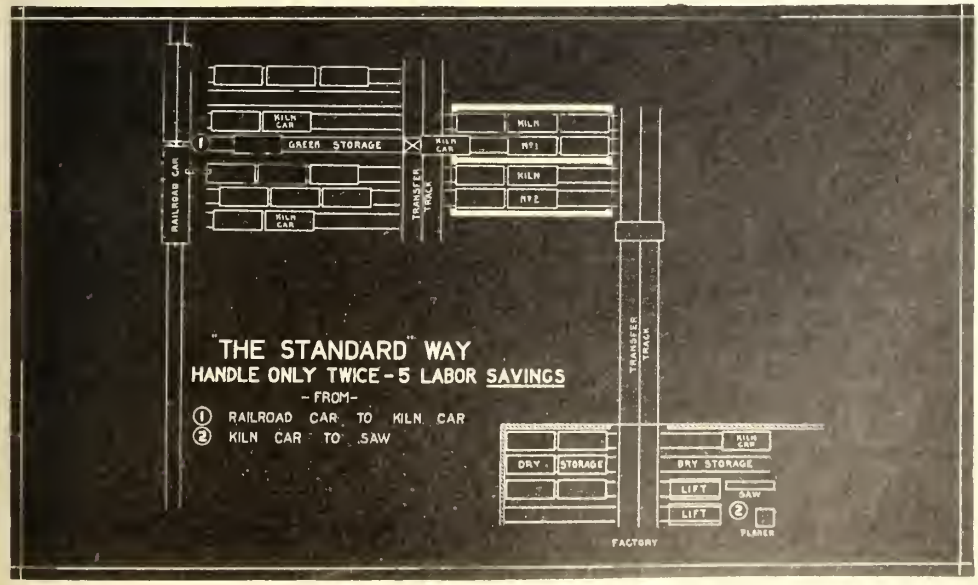

Fig. 2—How five handlings may be eliminated

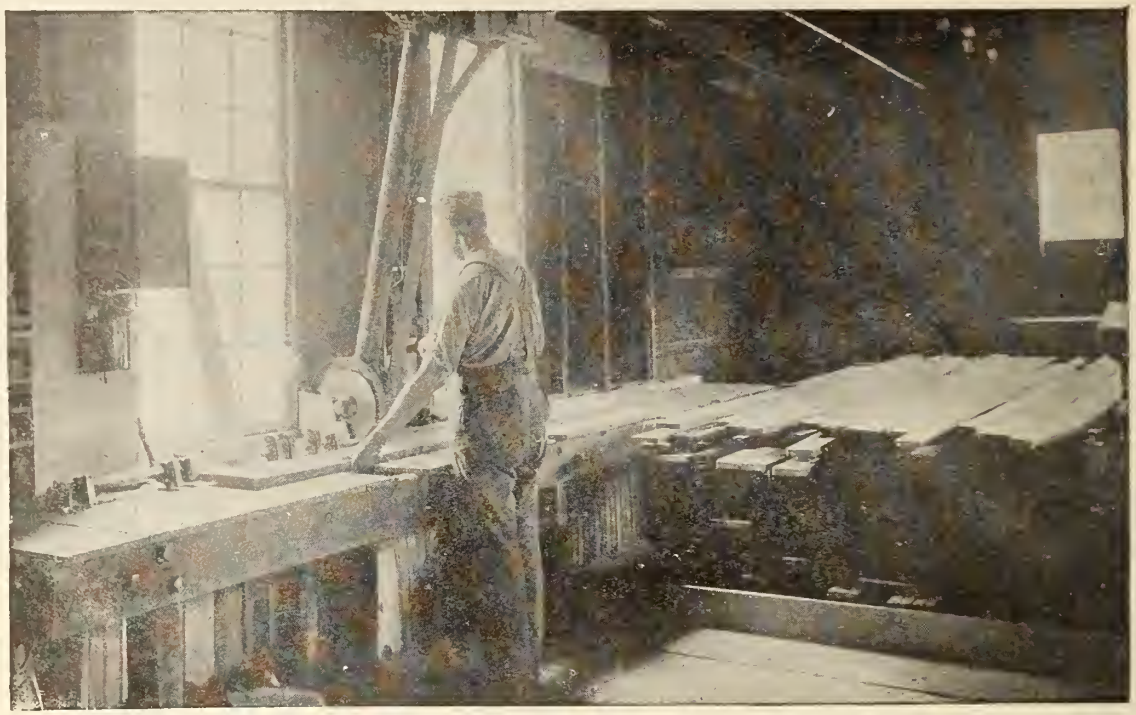


This swing-saw operator can do more work because top of car is always at convenient level.

The lumber is allowed to equalize. This means that its moisture content from outside to centre balances even better than it did in drying, and any defects along this line in drying may be overcome. Consequently the boards upon being resawn are in less danger of cupping. Joints and grooves do not swell when fresh surfaces are exposed to the air. These advantages show up throughout the plant in the many other operations which follow the drying. Glue joints hold. Closely machined pieces fit when matched in other portions of the plant after several days' standing. Many troubles in the varnish room, which would be traced to the lumber, are eliminated.

Having a dry storage track also enables the loaded car to be taken from that point and run it on to a lumber shift, as shown in Fig. 2. This eliminates another handling at this point because the boards are left on the kiln trucks. The entire car is not unloaded onto a flat pile at the saw. This handling is saved and in addition, you gain the increased speed that comes when using a lift. You also eliminate the helper who hands down the boards from the top of the loaded car—because the top of the car is now lowered to the height of your saw table. The lift is a sort of elevator platform, having rails onto which the kiln car is pushed. It is then lowered; that lowers the kiln car of lumber until the top course is at any point desired. The man at the saw can pick off the boards himself and he does it with less effort than under the old system because they are always at the same level. As he takes off one course, he pushes a button and the lift raises the load one course at a time. Therefore, the handling which the man at the saw does is only the second handling in the whole course of each individual board "from car to saw".

It does not require a large plant to make use of the advantages suggested above. The layout for the Canadian plant of Langslow, Limited, Cobourg, Ontario, gives an idea which can be adopted by most plants. For those using end piling, the other illustration shows possibilities. Both show the relation between kiln capacities and storage capacities suggested for plants of that size.

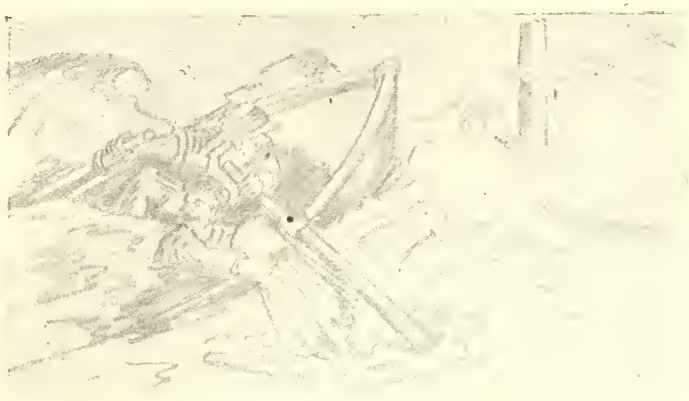
The numerous ways in which such a system effects savings are apparent to anyone applying the ideas in these sketches to his own plant. A large surplus of air-dried stock in unnecessary. This does away with a heavy investment in lumber, reduces insurance and risks when large stocks are carried. It makes it possible to get the oldest lumber into the kiln first. It enables different kinds and thicknesses of stock to be separated, which means better drying and less losses in the kiln. If no other saving resulted than the saving in re-handling the lumber, running as it does anywhere from 50 cents to four or five dollars a thousand, this alone would justify the installation of the simple system of storage tracks and the general method of handling "from car to saw."

Our Front Cover Design

The illustration in the centre of the front cover is particularly appropriate in view of the special character of this issue. It shows a mechanic in the plant of the Brunswick, Balke, Collender Co., Toronto, fitting the doors on phonograph cabinets. How much better and quicker is this than the old method of fitting with a hand-plane. In some plants a disc sander is used for fitting doors and drawers but the edge sander, with straight steel plate behind belt, is much more suitable. This is just one illustration of what "modern methods" mean.

One of these days circular and other saws will be made of such tough metal that cutting a 6 in. nail will not affect the sawing any more than cutting a knot.

Bailing a Boat vs. Operating Dry Kilns



Air is Vehicle for Bailing Moisture from Kiln—Emphasizes Need of Adequate, Uniform Circulation—Some Points Worth Watching

By Thos. D. Perry*

The bailing of a leaky boat is familiar to everyone and it is easy to make a mind picture of the number of "pails-full" that would be required to empty the boat. It is only a little harder to imagine bailing a boat with something porous and absorbent like a sponge, and it would be possible to compute the number of "sponges-full" of water contained in the boat.

Keeping this illustration in mind may help to make kiln drying a little more clear. In operating dry kilns the problem usually appears complicated and the principles obscure. Comparing with the boat, however, let us imagine that every cubic foot of air in a dry kiln is contained in a sheet metal cube so that it could be handled the same as a "pail-full" of water in bailing the boat. Air is absorbent, something like a sponge, and will carry water in the form of vapor. Ascertaining the total number of cubic feet of air in a kiln is easy. Tabulations tell us that each cubic foot of air will carry so many pounds (or fractions of a pound) of water vapor depending on the temperature, and the air in the whole kiln would hold a definite quantity. In order to remove any given amount of water (in the form of vapor) from the lumber in the kiln we would have to fill and empty the kiln with air a stated number of times.

Table Giving Absorbing Power of Air

Temperature	Weight Water Vapor in one Cubic Foot of Air
Fahrenheit	Grains	Pounds
50	4.08	.0006
60	5.75	.0008
70	7.98	.0011
80	10.94	.0016
90	14.72	.0021
100	19.76	.0028
110	26.11	.0037
120	34.11	.0049
130	44.09	.0063
140	56.41	.0081
150	71.51	.0102
160	89.76	.0128
170	111.71	.0160
180	137.89	.0197
190	168.85	.0241
200	205.37	.0293

From tables by Grosvenor and Goodenough

7000 grains = 1 pound avoirdupois

Moisture Absorbing Power of Air

The application of the tabulation used in the operation of dry kilns requires the observance of such variables as temperature and humidity, but the purpose of the above simile is to show the absolute necessity of a positive circulation of air in a dry kiln. The absorbing power of air varies with its temperature, from 4 grains per cubic foot at 50 degrees to 205 grains at 200 degrees as shown by the accompanying table:

The three important variables in dry kiln operation are circulation or ventilation, temperature or heat, and humidity. The third in a dry kiln is the humidity and it can be compared to the brake on a vehicle, because it is the retarding element that prevents too rapid drying of the surface of the lumber and keeps the surface of the lumber soft and plastic while moisture is coming out from the centre of the boards.

Natural Movement of Air

It is not the purpose of this article, however, to discuss the problems of heat and humidity, even though they are of sufficient importance enough to warrant it, but rather to emphasize the need of adequate circulation. The short comings of most dry kiln operators and the mechanical deficiency of most dry kilns lie along the line of inadequate ventilation.

Nature provides the force of gravity which when properly used will give all the power and speed necessary for ventilating lumber during the drying process. In other words the cubic foot of air illustrated above (if not saturated) will absorb moisture; as it absorbs moisture and drops in temperature it will have a tendency to settle lower and lower in the kiln. Eventually this cubic foot of air will arrive at the lowest point in the dry kiln, which should be considerably beneath the rail line, and from there proper means must be provided to release the air and lift it out through stacks or chimneys. A kiln with outlets at the bottom conforms more nearly to scientific facts in the removal of used kiln air than any other type of drying apparatus.

Why Circulation is so Important

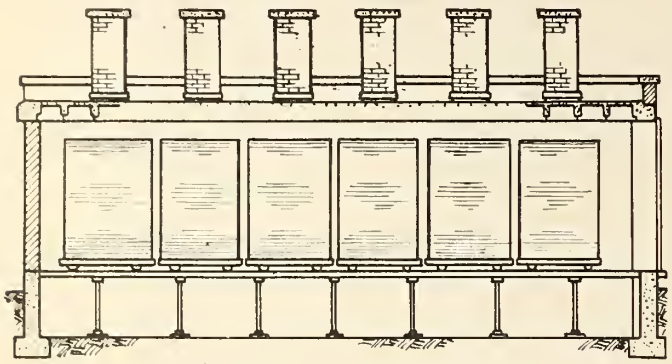
It is not easy to visualize the amount of water which must be removed from lumber. Suppose we take as an example 20,000 feet of gum lumber of 25% of moisture content and wish to reduce this to 5%, removing of 20% of moisture based on the dry fibre weight. Gum lumber (ovendried) will weigh 2250 lbs. per thousand. 20% of this is 450 lbs. water to be removed per thousand feet. The total weight of water when removed would be 450 x 20 or 9,000 lbs. or 144.3 cubic feet, requiring a square tank 6'0" x 6'0" and 4'0" deep, to hold it. This is equivalent to 1800 gallons or 36 barrels of 50 gallons each.

A kiln holding 20,000 feet of lumber (40' L x 18' W x 10' H), of which a cross section is shown, in the

*Grand Rapids Vapor Kiln, Grand Rapids, Mich.

accompanying sketch would contain 7,200 cubic feet, above rail line; 20,000 board feet lumber makes 1,700 cubic feet and allowance for stickers and trucks would bring this to 2,200 cubic feet; leaving a net of 5,000 cubic feet of air to be used for absorption purposes.

Basing our computations on the 1/100 pound of water that can be carried by one cubic foot of air at



Showing proportion of air and lumber

150 degrees and using only half of this as the useful range(from 20% saturation to 75%) we find that we require 1,800,000 cubic feet of air to carry off this moisture. If the net cubic content of the kiln is 5,000 cubic feet it would require 900 complete changes of kiln air. Two air changes per hour would be 48 per day and require about 18 days, three per hour 12 days, and four per hour 9 days. This is a theoretical computation based on scientific facts and calculated to make the dry kiln operator realize the tremendous importance of adequate circulation in a dry kiln. Unless a kiln removes the water from the lumber it is utterly worthless.

Some Timely Suggestions

Frequently kilns are operated on higher humidities, perhaps using only a third or fourth (instead of one-half) of the saturation limit, in which case either the air interchange must be increased or the time lengthened.

Many men, who pride themselves on being intelligent kiln operators, ignore or neglect the proper ventilation of a dry kiln to an inexcusable degree, in fact some even advocate a hot box in which all air removal is by leakage. Often kilns are so neglected that the outgoing air stacks are filled with rubbish or the dampers are allowed to get out of order or the top of the stacks are not properly equipped with hoods or other weather protection.

A few practical suggestions to kiln operators are: 1. Always follow intelligently instructions of the makers of the type of kiln in use. 2. Keep kilns tight and in good operating order. 3. Regulate them as directed. 4. Appreciate the principles involved in the proper combination of ventilation, temperature and humidity..

What Comprises Breaking-out Department?

Most Important Section of Plant—Lumber, Which Means Money, May be Saved or Wasted in This Department—Organizations and Equipment of Prime Importance—Foundation of Whole Production System

By H. H. Poole

It may seem peculiar to profound the question,—"What constitutes a breaking-out department, but a moment's consideration will serve to indicate that there is more to this query than at first appears. Not that it is important to make a clear distinction between the breaking-out department and machine shop proper, but where does the breaking-out section end and the machine department start? Often when conducting a visitor through a plant, the manager or superintendent will indicate a few saws with a wave of his hand and state that this is our breaking-out section. It is doubtful if the speaker himself has a clearly defined idea of what he means.

Before we attempt to outline what might constitute an up-to-date breaking-out department, it might be well to attempt a definition. The purpose of this part of the plant is to prepare the stock for planing, shaping, sticking and other operations in the machine room proper. If this outline is accepted, the equipment of the breaking-out department would include, in addition to swing cut-off and rip saws, a buzz planer, edge jointer, clamping devices, dimensioning saws and perhaps a resaw. We will discuss this department in the light of the broader definition.

Lumber Lift Reduces Handling

As the breaking-out might be termed the neck of the bottle through which all the raw material flows, the provisions made for facilitating the handling of lumber are of prime importance. In the modern plant we find the stock is run in from the dry storage on the kiln cars. As a loaded truck reaches the breaking-out department, it is placed on a lumber elevator, situated convenient to the first machine. Ordinarily the top of the car of lumber is above the head of the machine operator, necessitating the assistance of a

Straight-edging and jointing saw in breaking-out department of Bell piano factory

helper. This is not any too satisfactory, and, in addition, helps to run up the handling costs. Using a lumber elevator, the top of the car is always kept at a con-

venient height, and the operator is enabled to size up each piece and select the one best suited to the cut he wants.

The first operation may be either cutting off on the swing saws or rough surfacing on a planer. Some manufacturers make a practice of surfacing all the material before it goes to the swing saw. This applies more particularly to the better classes of wood. When this is done, the swing saw operator can work faster because he is able to see every defect at a glance and can also cut the material with a minimum loss from waste and the stock may be matched to much better advantage. If this practice is followed, the dressing is usually done on a double surfacer. In that event the lumber lift would be situated in front of the planer.

How Stock May be Handled

The latest development in swing saws is one in which an electric motor is mounted at the lower end of the frame and the saw attached directly to the motor arbor. This means a beltless machine. A swing-saw with motor mounted overhead is a common installation. Whatever type or make of swing saw is used, it should be fitted with automatic stops. These are saving time, labor and stock in numerous factories.

When the material leaves the swing saw, it is roughed to width. In this operation the power-feed rip saw, either chain or spur-feed type, is replacing the hand feed variety. The power-feed machine does more work with fewer operators and with less effort on the part of the machine men. As a rule one power-feed machine will replace from two to three of the older type rip saws.

The stock is now ready for straightening and further machining or jointing and gluing up. Here again our feed equipment effects a saving. Large undercut planers or jointers with overhead feed works or ordinary type jointers with special overhead feed attachmente are cutting costs and increasing production in many plants. These machines are capable of handling a large volume of stock during the course of a day. The safety features of the finger planer or flattener, as some call it, are worthy of consideration.

Labor Saving Production Equipment

The modern type of edge jointer is a continuous chain feed machine in which the stock is passed along one side and back along the other. By using special heads, all types of glue joints, with the exception of the dovetail joint, may be made. When in connection with the productive clamp carrier, the two form a production combination which is hard to beat. When the glued stock is removed from the clamps, it may be run through the power-feed straightener and then moved along into the machine room proper.

In view of the above, our modern breaking-out department would be equipped with lumber lift, swing cut-off saws, power-feed rip saws, undercut planer, continuous feed glue jointer and a set of revolving clamps. These machines should be so arranged that the stock moves forward as each operation is completed. The idea of having the swing cut-off saws and ripsaws arranged in groups as described elsewhere in this issue in the article on the plant of the North American Furniture Co., Limited, Owen Sound, is a good one. Each group handles one particular class of work, enabling the operator to become a specialist in cutting a certain kind of stock.

Importance Not Fully Realized

There is more to this department than its equipment. It must be so organized and manned by trained men that the work will go through without confusion and delay and so that all the stock will be worked up with a minimum of waste. The organization of this department might well start in the lumber yard. It is necessary that some accurate check be kept on the lumber in the yard and that somebody be made responsible for maintaining sufficient seasoned lumber in the dry storage room to take care of all the orders as they come along. This requires close co-operation between the management, which has a check on the different items in the finished stock room through some simple perpetual inventory system and also a check on the orders in hand, and the man responsible for the supply of dry raw material.

It might be well to emphasize the necessity of having trained, intelligent men in this department. While the operation of the swing cut-off saw may not call for a very high degree of skill, yet judgment of a rare order is required for selecting the cuts and

Spur or power feed rip saw is found in many plants

working the stock to the best advantage. Instances are not lacking where a swing cut-off operator who was interested in his work had cut twice as much material from the same amount of lumber as had a careless operator. A careful check should be kept on all lumber going through this department. A standard maximum waste allowance might be figured out and the operator given credit for all savings effected below this figure and penalized where the waste exceeded the maximum allowance.

This department plays a bigger part in the efficient operation of a furniture manufacturing plant than most factory managers realize. It is the very foundation and heart of their whole production system. Any weakness or looseness here will be reflected throughout the whole organization.

If the new year has come without you making any resolves, then start at once and make this one, that you will use the saw guard over the saw, not put it on a nail in the wall. When a man has a band saw break, and a piece flies within a half-inch of h's nose, he realises that a wire guard over the wheels and a plate at the side of the saw is of some real use.

"Play the Game Hard" but "Play the Game Fair"

Furniture Manufacturers' Association Holds Two Day Meeting—Many Practical and Instructive Addresses—Reports of Different Committees—Factory Managers, Superintendents and Foremen Have Interesting Session

With the above caption for a motto the furniture manufacturers of Canada are away to a good start for 1922. This is the slogan adopted at the well attended annual meeting of the Furniture Manufacturers' Association which was held in Toronto, on February 1st and 2nd. A new departure was made this year when the sessions of the first day were thrown open to the factory managers, superintendents and foremen for a discussion of their problems and for the presentation of interesting and instructive addresses on subjects pertaining chiefly to their fields.

In opening the meeting, the chairman, J. H. Baetz, touched on the vast strides which had been made by the furniture industry during recent years. The day of individualistic, selfish, for-myself-only effort is past. To-day's conditions require co-ordinated effort to overcome difficulties and to advance the furniture industry. To appreciate the great improvement made during recent years in the furniture industry, Mr. Baetz intimated that one had but to come to this meeting of managers and superintendents, listen to the addresses to be made and the discussion to follow; then if one can leave, feeling that these meetings are of no benefit, that our old selfish individualities still are as strong as formerly or that combined effort can accomplish no great good, then indeed our case is hopeless. "Speaking for myself," he continued, "I believe that our industry has made remarkable progress during the past seven or eight years; for instance, would it have been possible, even ten years ago, for a meeting such as the one of to-day in which we are gathered together to discuss improved methods for our industry and to listen to instructive addresses on practical subjects, not as individual manufacturers but as members of an industry having as our object the betterment of conditions in the industry."

Wm. Krug,
Krug Bros. & Co.,
Chesley, Ont., Chairman.

J. A. Minchner,
North American Furniture Co.,
Owen Sound, Ont., Vice-Chairman.

The first speaker to address the meeting was F. C. Lovett, of the Canadian Accident Prevention Association. Mr. Lovett dealt largely with the responsibilities for the many accidents which occur in the furniture industry. He thought that a large part of the responsibility rests upon the shoulders of the foremen and superintendents, also that the management should take their share of the blame. Of all the accidents which occur, fully 90% are preventable. During 1920 over 300 accidents took place in the furniture industry. The cost of these to the furniture manufacturers was in excess of $40,000.

Safety work is one of the most important phases of industrial activities. Accidents are unnecessary and it is for the superintendents and foremen to take a hand in instilling that thought into the minds of the employees. The foremen should see that safety devices are provided and used, but this is not enough. Safety appliances will only prevent 25% of the accidents. The men should be given thorough instruction covering the dangers of operating the machine at which they labor. If they do not

William Cawkell,
Toronto, Secretary
Furniture Manufacturers' Association

take full advantage of the safety appliances provided, it does not shift the onus of blame. If a workman will not carry out the instructions and play safe, he should be dismissed. The aim of all those in authority should be to prevent accidents, saving life and limbs and the management in our factories are the ones who should be the most interested.

Training Course Discussed

Mr. Lovett was followed by James E. Ferguson, of the Cost Accounting Department, who gave an outline of the scheme of training drafted by the special Training Course Committee. The question of future supply of skilled mechanics is a pressing one. The elegible raw material from which skilled workmen may be developed was being attracted by

W. J. Anderson,
Stratford, Chair Co.,
Stratford, Ont., Director.

other industries which offered a higher rate of remuneration. To counteract this a special course of training for apprentices is being developed. At the present time the first series dealing with cabinet-making is being worked out. It is believed that this work will be of great benefit to the furniture industry. While cabinet-making is being tackled first, if the course is found to work out successfully, it will be extended to other phases of furniture work. (This scheme was outlined in the January "Canadian Woodworker.")

A short treatise on the various adhesives used in the furniture industry was presented by W. J. Feldkamp, of the Canada Glue

H. M. Snyder,
Snyder's Limited,
Waterloo, Ont., Director.

Co. Brantford, Ont. Mr. Feldkamp dealt with animal, liquid and vegetable glues, explaining how they are manufactured and used. In describing the various processes through which animal glue passes, he showed samples of the raw material in different stages of manufacture. Hide glue, which is the highest quality animal glue made, is produced from the fleshings and cuttings taken from raw hides, while bone glue, is as its name implies, made from bones. To-day glues are tested and graded according to certain definite standards. The manufacturer of glue aims at uniformity of grades so that a woodworker buying a certain grade of glue can be assured of the same quality in each batch received.

Vocational or Part Time Schools

After the noon adjournment the discussion on technical training was resumed and a motion approving the efforts of the Labor Committee was unanimously carried.

Dr. Merchant, head of the Industrial and Technical Education Branch of the Ontario Board of Education, gave an interesting and instructive talk dealing largely with part time and vocational training. He stated that the resources of Canada, vast as they are, are worthless unless developed by human hands and human brains. The skill and knowledge necessary to take advantage of these raw resources, can either be developed in coming generations or we can import the necessary skill and learning from other countries. His department is endeavoring to provide proper education for our boys and girls to bridge over the gap between our day schools and our industrial and technical requirements. The passing of the old apprenticeship system has tended to throw more work on the technical school. There are some things which can be taught best in the schoolroom while other phases of the work can only be taught advantageously in the factory. This has led to the development of what is known as the part time school in which the pupil spends so many hours at school and so many hours in the plant. The policy of the department is to work with employers of labor and to try and meet the requirements of industry. He further stated that his department was in a position to, and was anxious to work with any industry which felt the need of imparting specialized training, covering the requirements of that particular field in an effort to develop boys capable of taking their places in that industry.

An interesting address on "The Kiln-Drying of Lumber" was given by Thomas D. Perry, of the Grand Rapids Vapor Kiln, Grand Rapids, Mich. This was illustrated by lantern slides. Mr. Perry intimated that we had only begun to delve into the science of drying lumber artificially, but that a few fundamental facts were available on which to base our methods and theories. Lumber should be dried so as to relieve all internal strain, reduce shrinkage and secure a un-

W. Gray Hay,
North American Bent Chair Co.
Owen Sound, Ont., Director.

form moisture content. Steam is employed largely to equalize the moisture content, relieve strain set up during air-drying and to heat the lumber equally and uniformly. The most important considerations in the artificial drying of lumber are heat, humidity and circulation. Lumber is dried not so much by warmth of the air as by the thirst of the air for moisture. Of the three factors mentioned, circulation is, probably, the most important for unless the moisture-laden air is removed and replaced by air having a lower relative humidity, the moisture cannot be removed from the lumber. The different types of kilns, such as blower, gravity and condensing types, were touched on briefly. One of the most important considerations in dry kiln operation was the piling of the stock. It should be piled so that the air will have free access to all parts of the pile and so that the boards, including the ends, will be well supported by stickers. Unless this latter suggestion is followed, considerable warping and twisting is apt to occur. Mr. Perry closed with a reference to the keeping of dry kiln records. He thought it highly advisable for every manufacturer to insist that records be kept. In this way if trouble occurs, a reference to the record for that particular run will, probably, show where the trouble lay, and suggest means for preventing its re-occurrence.

Reports of Various Committees

The business session of the general meeting was opened on Thursday morning. After the members were called to order, Mr. Cawkell, the secretary, presented the chairman with a mahogany gavel. Following this a communication was read from the secretary of the Retail Merchants' Association, asking the furniture manufacturers to pay more attention to the stamping of numbers and other indentification marks on their furniture, the dealers often having considerable trouble in ascertaining the number or identity of certain pieces of furniture.

A. Ford,
Interior Hardwood Co.,
Kitchener, Ont., Director.

G. A. Gruetzner,
Hespeler Furniture Co.,
Hespeler, Ont., Director.

The retiring chairman, J. H. Baetz, then delivered an inspiring address reviewing the work of the Association and conditions in the industry. This appears elsewhere in this issue.

In the secretarial report, Mr. Cawkell thanked the chairman and members of the various Committees for the support they had tendered during the year. He also complimented the association upon the good attendance at the numerous meetings held throughout 1921, a large number of manufacturers attending ten meetings or more, while fourty-four manufacturers attended four or more meetings. The finances are in a healthy condition, the year showing a surplus. The expense of fitting up the new offices has been completely written off.

Credit Section Does Good Work

The report of the Credit Committee was presented by the chairman, Mark Rowe. Mr. Rowe considered that the members of the Furniture Manufacturers' Association had every reason to congratulate themselves on the very small percentage of losses sustained by the membership during the past year. This was in no small measure due to the services of the "credit section." He suggested that they were not yet out of the woods but were facing another year of strenuous effort. Commercial failures during 1921 numbered 2,451 with total liabilities of $73,299,111. This was a record for Canada, the next highest total being $41,000,000. of liabilities in 1915. The credit bureau was exceptionally active during the year, as witnessed by the large number of reports issued. He was of the opinion that the credit section was one of the most valuable assets of the Association.

The labor situation was covered by James E. Ferguson, in a brief report dealing with labor conditions, also with accidents and other similar matters.

D. E. Macintyre,
North American Furniture Co.,
Owen Sound, Ont., Director.

Importance of Cost Knowledge

Mr. Ferguson also presented the report of the Cost Accounting section, dealing with the work of that department in extending knowledge of factory costs, which knowledge must always form the basis of proper control of business activity. The report covered prices on material entering into furniture, cost of furniture and by means of drafts and charts, the speaker was able to show the trend of general commodity and raw material prices.

The report stated that certain

sections of the furniture industry have suffered severely and goods have been sold at prices which bear no relation to costs. A continuation of this policy, if it can be called a policy, will eventually pull the whole industry down to a non-profit level. Regrets and

F. W. Trebel,
Kindle Bed Co.,
Stratford, Ont., Director.

good intentions are not recorded in the profit and loss statement, and unless facts are faced squarely, there will be many statements which will not afford much satisfaction. In the past our industry has been slow to respond to improvements in general conditions. Now is the time in the new cycle, to avoid errors of the past.

It is gratifying to report that some members have applied themselves whole-heartedly to the problem of cost reduction, and it would be a lasting benefit if everyone would take steps to examine all factory operations. Cost knowledge is absolutely necessary to any industry. It is the keystone of the whole structure, and once this knowledge is acquired, the problems of sales and profits become less formidable. Our hope is that during 1922 there will be an extensive and truthful examination of all costs and that there will be a real re-adjustment on a profit-making basis. If our costs take care of all elements of material, labor, overhead and a reasonable profit added, our price position is unassailable.

Mr. Cawkell on behalf of the Better Merchandising Committee, stated that this committee was only appointed in November. It had for its object the overhauling of the whole selling machinery which was such a powerful factor for weal or woe in the furniture industry. As a whole, the furniture manufacturers are not skilful salesmen and in this respect might learn a great deal from the retail furniture dealers who with a pro rata investment very much lower than that of the makers of furniture, are able to turn their capital over four to five time each year, while the manufacturers only turn theirs once. Meetings of this committee will be held frequently and a strong effort will be made to improve selling conditions.

Officials and Committees

The following officials were elected for the ensuing year:—

Wm. Krug, Krug Bros. & Co., Limited, Chesley, Ont., chairman; J. A. Minchner, North American Furniture Co., Limited, Owen Sound, Ont., vice-chairman.

Executive Committee:—W. J. Anderson, J. H. Baetz, J. E. Campbell, G. A. Gruetzner, P. R. Hilborn, J. S. Knechtel, James Malcolm, J. R. Shaw, H. M. Snyder, E. O. Weber, D. M. Wright, High-grade section,—D. E. Macintyre; Medium, L. Malcolm; Lower,—J. J. Spiesz; Table, George J. Lippert; Chair, W. G. Hay; Upholstering, W. Trebell; Office Furniture, H. Ford; Filing Cabinets, F. E. Mason.

Labor Committee:— W. J. Anderson, J. H. Baetz, James E. Ferguson, P. R. Hilborn, J. S. Knechtel, G. A. Gruetzner, D. E. Macintyre, A. Malcolm, A. H. Smith, H. M. Snyder, J. J. Spiesz, A. H. Watson, D. M. Wright.

Merchandising Committee:— J. H. Baetz, W. Cawkell W. E. Dolan, J. S. Knechtel, D. E. Macintyre, James Malcolm, J. McPherson, J. Orr, E. O. Weber, D. M. Wright.

Purchasing Committee:— W. J. Anderson, W. G. Hay, P. R. Hilborn, E. O. Weber.

Credit Committee:— M. S. Armstrong, W. J. Fleischaeur, James Garvie, R. Gomery, J. H. Kennedy, E. R. Purple, L. J. Salter, J. McPherson, Mark Rowe.

Tariff Committee:— R. J. Ball, Thomas Dillon, G. A. Gruetzner, O. A. Keffer, J. H. Kennedy, H. R. Magwood, N. Peppler, W. T. Sass, W. T. P. Seyler, I. Wegenast.

Transportation Committee:— J. Bailey, F. E. Coombe, W. G. Durst, C. Gruetzner, W. G. Hay, J. H. Kennedy, C. McMurtry, S. Taylor, F. W. Trebell, J. H. Weolner.

William Cawkell, Toronto, Secretary.

Chairman Asks for Active Co-operation

Upon the new chairman, Mr. Krug, taking the chair, he was presented with an attractive gavel to assist him in maintaining order at the various meetings over which he will preside. In a brief address he thanked those present for the signal honor they had conferred on him, and asked for the full support and active co-operation of every member of the association. He realized that a big task confronted him in attempting to fill the place of the retiring chairman, but with the full support of all members, he would do his best.

An interesting miniature model of the Sturtevant forced circulation dry kiln was on display in charge of Mr. K. Redman, of the B. F. Sturtevant Co., Boston, Mass. Mr. Redman delivered a short address dealing largely with the necessity for an adequate uniform circulation, and pointing out how this was obtained in the Sturtevant kiln. By means of a blower system heating coil and properly-designed ducts, the air was carried

F. E. Mason,
Globe Wernicke Co.,
Stratford, Ont., Director.

to all parts of the kiln and forced up through the centre of the piles, wiping each side of every board. In this way uniform and rapid drying was secured.

The meeting was then turned over to the Home Furnishings Bureau, when J. G. Gronberg, of

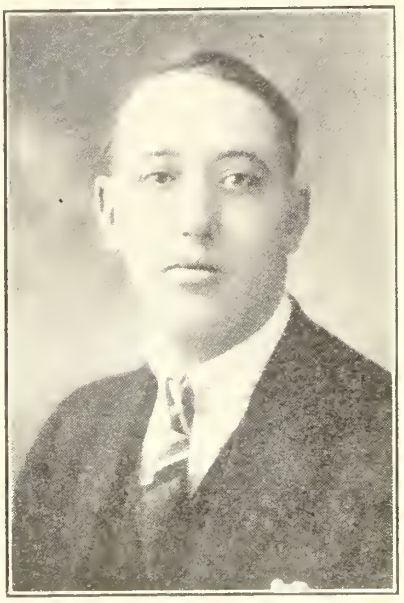
Foundation of Economical Production

J. E. Alain, Victoriaville, P.Q.
Vice-pres. and general manager

Sectionalizing of Departments Adopted by Victoriaville Furniture, Limited

Economical Advantages of Distributing Work in such a Way as to Ensure Maximum Output at Highest Efficiency



Geo. Cantin, Victoriaville, P.Q.,
Secretary-treasurer

In the final analysis, economical production is based on system—on methods designed to secure the maximum of output at the lowest cost, and to eliminate the many leakages so apt to occur, and which, small in themselves, in the aggregate, constitute a very important item in the cost of manufacture.

Such a system cannot be of a castiron character. Furniture factories, for instance, vary so much in size and in output that it is impossible to rigidly apply one method to every factory—there must necessarily be a certain amount of individuality in the application of a system. Location, sources of supply, proximity of market, and labour enter into the cost of production. But the great determining factor is the co-ordination of the work of every department under a plan which has for its object the economical production of the particular commodities produced by a given factory.

In the olden days of the industrial boom, the tendency was frequently to overlook the leakages referred to. Firms were making large profits, and the ever-growing expenditure was a matter for casual remark rather than for the adoption of drastic measures of retrenchment. Those days are over, and the close competition in almost every line of business has compelled greater attention to the question of reducing the cost of manufacture by the application of cost accounting and other systems.

Sectionalizing of Departments

One of the most important elements of factory management is the sectionalizing of departments, by which these are divided into sections and the men engage in definite operations. By this method workmen become very efficient in their particular work, by reason of the fact that they are employed on it, and it alone, month after month. This is the system which is adopted at the factory of the Victoriaville Furniture, Ltd., Victoriaville, P. Q. Founded in 1894, the Company was formerly known as the Victoriaville Furniture Company, Limited. In 1920 the Company was re-organized, and in March of that year was purchased as a going concern by Mr. F. Canac Marquis, of Quebec, who is President; Mr. J. E. Alain, Vice-President, and General Manager; and Mr. G. Cantin, Director and Secretary-Treasurer.

The main part of the Company's business for many years was the manufacture of medium grade case goods in surface oak. A radical change of policy has been decided on and is being carried into effect. The Company is now making solid walnut, quarter oak, birch, walnut, and surface oak furniture. The directors, in making the change, are of opinion that the Company possesses advantages which will make for success—a well-equipped factory, proximity to market (it is intended to devote special attention to Eastern Canada), cheaper freight rates as compared with other and more distant plants, economical manufacture, and a good supply of labor at wages which are not so high as in some other furniture making centres. The company has also the advantage of owning timber limits and sawmills. The limits, of 5,000 acres, contain principally birch, and are situated, with one mill, at Paul de Chester, fifteen miles from Victoriaville, the other mill being at Notre Dame de Ham. To use the words of Mr. Alain, the company is in a position to make furniture from "tree to crate."

Changes and Improvement to Plant

In entering upon the manufacture of a better grade of goods, the directors have made alterations in the plan of factory management, and in the arrangement of the departments, with a view to securing the utmost efficiency. The work has been more thoroughly systematised and greater attention given to certain details as to the routing of work, etc., so that the company starts with a clean sheet, so to speak, in the manufacture of the new lines of furniture.

All the furniture is designed by the staff of the company. In addition to the detail drawings, rods for factory use are made. These rods are of clear basswood, and are given castings of shellac and of varnish. They show the full size of the pieces, eleva-

tion and width, cross-graining being in red and blue markings. Every piece shown on the rod is numbered and indexed—as for example—1, top; 2, front parts; 3, back parts; 4, gables; 5, front rails in frame; 6, back rail in frame, etc. The rod accompanies the job through every department, and is so explicit in its character that a mistake as to the details of the work is almost impossible. Its labor-saving quality consists in the fact that it supplies the workman with all the information necessary, and obviates waste of time in seeking instructions from the foreman.

Three stock bills are used—one for the office, one for the superintendent, and one for the break-out man. The index number on the stock tag corresponds with that on the rod index, so that a workman by looking at the rod can at once obtain full details of the piece referred to. Besides this, the tag contains on the back a list of the machines to which the

piece must go. The tags are of red and white cardboard, the red being for special orders. They are made out in the general office and are checked over by the superintendent before being sent to the factory.

Equipped for High Production

About 125 men are employed in the factory, which consists of a ground floor and two storeys. It is a well-lighted building with a floor capacity of 95,200 feet and is equipped with a sprinkler system. The lumber yard is of ample size, the company maintaining a minimum stock of a million feet. The kilns consist of four sections, with a total capacity of 100,000 feet of lumber. The kilns are on the moist air system of the National Dry Kiln Company, Indianapolis, and will accommodate 56 trucks. After being dried the lumber is conveyed on the trucks to the machine shops on the ground floor. In this department every piece or job is routed through in order, and at each operation the pieces are counted and sorted, this rule being strictly enforced. There are two elevators running from this floor to the top portion of the building. One elevator is used to take all the pieces up to the other floors, and the other, at the opposite end of the factory, to send down goods and pieces.

We need not describe in detail the various operations in the machine shop, where the work is prepared for the cabinet department. The machines include breaking-out and cut-off saws by MacGregor, Gourlay; Yates' self-feeding rip saws; automatic log lathe, by the Wood Turning Machine Company, Detroit; dovetailing machine, by the Advance Machine Works, Toledo; lock and keyhole machine, by the National Lock Company, Rockford, Illinois; and other machines by Cowan & Company, Galt, and the Canada Machine Corporation, Galt. Among the newer machines acquired is a lathe for Queen Anne legs, made by the Empire Machine Works, Mount Morris, N. Y. The company also operate a Linderman automatic jointer and gluer. The merits of this machine are too well known to be referred to at length, sufficient to say that it is regarded as one of the most efficient machines in the plant. Here and in other departments, trucks are used to convey the various pieces from machine to machine—these trucks have proved great labor savers, eliminating the loss of time involved in piling pieces on the floor and then removing them. It is more economical to spend money in purchasing trucks than in paying wages.

The repair shop and filing room is at one end of the machine shop. The company use chiefly the saws of Henry Disston & Sons, Limited, Toronto.

Well Arranged Cabinet Department

The cabinet department, on the next floor, is admirably arranged for economical production. All the benches and machines are arranged around the sides of the room under the windows, thus securing the maximum of light. The department is divided into three sections—sanding, assembling, and chair. In the first-named, two new machines have been installed. One, made in the factory, is for sanding Queen Anne legs, and the other by Chimmel-Reid & Company, Faribault, Minn. The various parts next go to the assembling section, where the idea of section work is carried out to the fullest extent. Thus all the gables are assembled at the gable clamp, and the cases at the revolving case clamp. The latter machine, by Jackson-Cochrane & Company, Kitchener, Ontario, will take a six-foot case. One man does nothing else but assemble drawers, another assembles toilets, a third makes dining tables only, while others are engaged in fitting the cases with drawers, doors, and so on—the work being so arranged that the men attain a high degree of efficiency from working for long periods at their special jobs. In place of a central glue kettle, each man has a glue kettle fixed above the bench, heat being derived from the boilers. This saves a considerable amount of time—it is in fact one of the small but effective changes which have been made in the factory arrangements. The surface oak goods are assembled in this section, after having undergone a printing process. The printing machine was supplied by the Grand Rapids Panel Company, Grand Rapids, Mich.

The machinery in the cabinet department includes a multiple boring and mortising machine by the Wysong & Miles Company, Greensboro, Carolina, three spindle borer, double borer, bed case clamp, and toilet case clamp. The latter was made in the factory and is controlled by hand wheels and screws, giving a uniform side pressure. It will take any size toilet case. In the chair section, the chairs are assembled and clamped. It might be mentioned that the company has in view a plan for supplying the cabinet-makers with tools especially adapted for the particular operations.

Finishing Department on Efficient Basis

From the Cabinet department the goods pass on to the finishing room, which is divided into five sections,—1, staining and filling; 2, sanding and shellacing; 3, varnishing; 4, rubbing and cleaning; 5, enamelling. The DeVilbiss air brush is used for shellacing, while in the varnish room another DeVilbiss sprayer is employed with excellent results. The company also use with good effect the Paasche pneumatic rubbing machine. Three coats of varnish are

We Should Consider Ourselves

"Directors of Furniture Industry"

Inspiring Address by J. H. Baetz, Retiring President of Furniture Manufacturers' Association—Day of Individualistic Effort Rapidly Passing—Outline of Various Association Activities

In presenting my report as retiring president of the Furniture Manufacturers Association of Canada, I wish first of all to pay a tribute to the officers whose whole hearted interest in the continued progress of this association has made possible, even during the difficult year through which we have just passed, the maintenance and improvement of the services which this association renders its members.

J. H. Baetz, Kitchener, Ont.,
Director and retiring president of Furniture Manufacturers' Association

It was a year ago that dire predictions were made that our association would not have strength to weather the storm of deflation; that members would again resume their individualistic selfishness and that the industry would slip back once more to the position it held seven or eight years ago. That these dire predictions failed is due in large measure to the broad gauge methods of our officials, and to the extension of our selves.

The day of successful individualistic effort may not yet be passed, but no one can successfully deny that it is rapidly passing, and that the day of co-ordination of effort and experience has dawned. The furniture industry in Canada, unfortunately, had largely gone the way all industry employing craftsmen, and those industries relying mainly on machine production had benefited at our expense, until the present organization was formed some eight or nine years ago. Since that time continuous progress has been made. Service after service has been inaugurated, until our members realize that the small cost of maintaining our organization is often paid for in the service rendered by one branch alone. If we can, in maintaining our association as an efficient organization, make the furniture business a staple, well maintained business, then we can feel our business is worth 100 cents on the dollar and one that would not have to be discounted from 50 to 75 per cent., as has been the case in the past, when the organizer of the business passed to his reward, or the business was sold to other interests. This phase alone is sufficient reason for maintaining our association as an efficient body.

Day of Co-ordination of Effort

But the day of co-ordination of effort is here. By considering ourselves not as individual furniture manufacturers, but as members of the furniture industry, who meet at our association offices as directors of the industry, further great progress can be made. More efficiently operated factories, better furniture, more artistic designs and more practical finishes, can be arrived at by exchange of information. Better marketing of our products and creating a demand for our products is another phase of this effort to really establish our industry as a basic industry of Canada, and one which can be accomplished only by co-ordination of effort, such as this Association provides for.

We can recall without any effort, because the changed conditions came about during the same time as the progress of our association, the improved roads in our province. Probably all of us remember the rutty, muddy, bumpy roads that formerly connected Toronto with Hamilton, and over which a motor ride was anything but a pleasure, especially to the owner of the car.

Let us consider the comparison of the former unimproved roads of the province, and the many still remaining to be improved, with our own industry of seven or eight years ago. The going was bumpy, rutty, and muddy. Let us then compare the present concrete highways with these unimproved roads. I do not think that anyone of us would choose to go over unimproved roads where pavements are available on which to drive.

To carry the comparison along a little farther, let us compare the joint efforts of our furniture manufacturers to the efforts of the men who had vision enough to build permanent improved roads. The road builders are not getting the most out of these roads, as they are there to be used by anyone, the builders included. They are there for the good of the community, and once having been establised, we would not do without them. The road we have built is the Association Road.

The Association Road

It is not necessary for every manufacturer to travel this road. He still can, if he chooses, use the old bumpy, rutty, muddy, side roads and probably reach his destination. The paved road of development of industry by association or by co-ordinated effort is, however, a much safer, smoother, cleaner method, and the destination is reached earlier. Travelling over a pavement leaves the mind freer of worry, and also avoids the tendency to constantly remain in the same rut in the road.

Continuing the comparison of association effort with improved roads, let us consider the various

services offered by our association as service stations along the road to success: First we have the service station of Assistance in Factory Problems. This station is equipped to assist our members in efficient operation of factories, to secure accurate records of production and costs, and to render any general service in the maintenance of an efficient organization. This service station is being enlarged so that it will also provide,—purchasing information, standardization of material used in the industry, tests and inspections of materials such as coal, lumber and other supplies.

When these are added, the service will be complete. Even now this service provides for the installation of cost systems, a guide through schedules as to average prices, and general information as to business conditions as issued in periodical bulletins.

Next we have the service station of Marketing. This is also being enlarged so that modern marketing methods will be used in distributing our merchandise. The first branch of this service. The Home Furnishing Bureau, is operating successfully, as witness the great interest taken by dealers, and the public generally. A special Merchandising Committee has been appointed, and information is being gathered to be placed before this committee for early consideration.

This committee should also consider the advisability of bringing our salesmen together for joint meetings such as we had yesterday for our superintendents. At these meetings addresses on salesmanship, design, etc., might well be given, from which everyone could learn of both methods in selling, and the fundamentals of the furniture business.

The service in existence for the longest period, and consequently a very efficient one, is the Credit Service. This serves as a check on overbuying on the part of certain dealers, and also as a check against unfair claims on manufacturers. It reports as to payments, renewals and other matters of interest to members on any furniture dealer in Canada. This indeed is a valuable service, and alone pays, I believe, in savings to members the entire cost of association services.

Future services planned include the adoption of a practical apprenticeship training course; one which will fit the need of changed educational and economic conditions, and which we heard discussed yesterday. A system of re-afforestation to provide in Canada at least a portion of the cabinet woods required, and a scheme of lectures of technical subjects by experts, some of which were discussed yesterday, and which among other subjects will include dry kilning, fabric construction, etc.

I do not feel that I am drawing an unwarranted parallel between association methods and improved roads; one is as necessary to progress as the other.

Rights of Others a Consideration

I further appeal, however, to our association members to recognize the rights of others on this association road. While as on modern roadways, certain rules have to be observed, so they must also govern our conduct towards other members on the same road. The road is wide enough for all, and recognition of each others' rights will help to make the journey more pleasant, and we will reach the end in a better frame of mind and in better condition.

Reports of the various standing committees which have had any work to do during the year will be submitted to you this afternoon, among them being the Labor Committee, Mr. Ferguson, Chairman, and Credit Men's Committee, Mr. Rowe, Chairman. A report on business conditions by Mr. Ferguson will also be presented. The Tariff Committee has had no occasion to meet during the year, nor has the Transportation Committee.

In regard to transportation, I am informed that no important changes will be made in Freight Classification No. 17 as compared with Classification No. 16 now in force. Proposed Classification No. 17 will probably come before the Board of Railway Commissioners some time this year, when our new Transportation Committee should carefully scrutinize the proceedings, so as to at least maintain the status quo in Classification.

A strong Tariff Committee should be appointed this year to deal with any tariff questions that may be raised following the change in Government.

Volume of Sales by Members

During the year the total business of our members fell from 19 millions to 12 millions. The figures for the various years in the immediate past are as follows:

Sale of Household Furniture in Canada by members of the association.

1915	6,162,133,00
1916	7,283,388.00
1917	8,835,589.00
1918	10,822,441.00
1919	16,566,546.00
1920	19,153,803.00
1921	12,000,000.00 (estimated)

Just at this point it would seem well to point out that in 1921 total sales dropped from 19 millions in 1920 to 12 millions in 1921, the reduction in prices of approximately one third during the year leaves the physical volume of shipments at about 90 per cent. of the physical volume of 1920. That the reductions in prices early in the year 1921, while not warranted by conditions prevailing at that time, were wise decisions nevertheless is proven by the total volume of sales. We assumed our loss early in the period of deflation, and the whole industry has benefited by the fact that the situation was handled well by our association.

Failures in these trying times, however, in proportion to volume of turnover are remarkably small. Averaging definite returns of failures made by many of the larger members, for 1921, we have estimated, and I think safely, failure losses to members of this association at 0.38 per cent. of sales. The failure losses registered in the period from 1921 to 1917, a six year period, were 0.85 per cent., so that during the past year we have, as a result of our Credit Service to members, reduced our losses through bad debts by over 50 per cent. This saving alone has paid for the entire cost of maintaining our association for the year, and besides paid a dividend on our investment in the association of 100 per cent. on the year's operation.

Our Imports and exports of furniture for the first eleven months of 1921, or to the end of November, which are the latest available figures, are as follows:—

	Imports	Exports
1921	1,174,728	298,336
For the same period of 1920 they stood at	609,217	773,886

The Home Furnishing Bureau Campaign in 1921 was carried on with an expenditure of $19,000.00.

with, I am sure, good results, although direct results are hard to check. An attempt to provide some check on results was the issue of the series of advertisments in portfolio form, which were sent to enquiries on payment of a normal charge of 10 cents each. Approximately 1,000 of these portfolios were mailed to those enquiring, which illustrates to some extent the interest of the public in Better Home Furnishing. Quite a number of appreciative letters from furniture merchants were also received.

During the Fall of 1921 your officials endeavored to call personally on all members. Unfortunately it was not possible to complete the program. Waterloo, Kitchener, Hespeler, Preston, Ayr, Hamilton and Eastern Ontario Centres were not visited, owing to lack of time. The visits made, however, were of considerable value.

I have endeavored to outline in condensed form the various activities of our association. Much work was done that cannot be touched upon in such a review. Needless to say, it has been a great pleasure to have been of some slight service to my fellow manufacturers, and I have very much appreciated the opportunity. To the best of my ability I have lived up to this position of honor and wish to record my thanks to every member for the kindness, consideration and assistance which they have rendered Mr. Ferguson, Mr. Cawkell and the other officials of the association as well as myself during the past year. In this way all have helped to maintain our association as the most progressive and best organized Trade Association in our Dominion, as it is recognized to be.

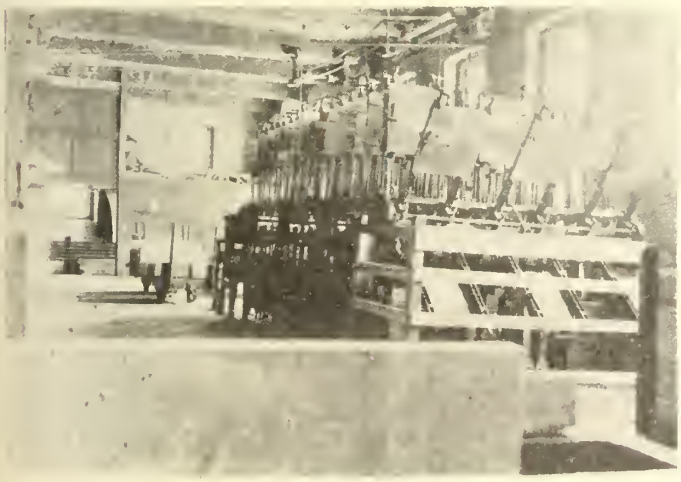
In conclusion may I bespeak for my successor, the various committees to be selected to govern this association in 1922, and the officiers, the same loyalty, and co-operation you have given the various committees, officials and myself during 1921.

The Development of Edge Gluing

How Clamp Carriers Cut Costs—Production Report Wood-Mosaic Co., Louisville, Ky. —Continuous-feed Glue Jointer Important Factor—Special Operations

by B. MATTHEW BURNS*

Probably the most primative method of clamping edge glued stock on a production scale that has persisted to the present day is the wedge method. It is true there are very few factories where one sees this method in use, and for his reason a brief description will be of interest. A heavy ten or twelve foot wooden beam of 6″ or 8″ squares cross section is secured



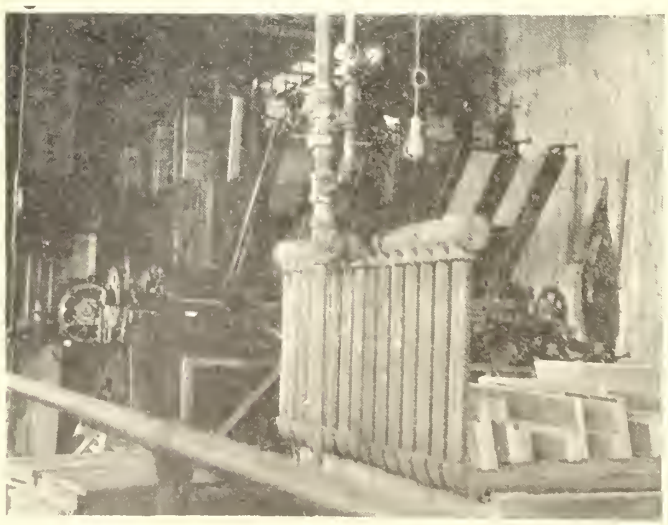
Clamp carrier in plant of North American Furniture Co., Limited, Owen Sound, Ont.

firmly at both ends just high enough above the floor to allow chair seats, say, to slide on edge easily underneath. The workman applies glue with a brush to the jointed edges of the pieces composing the seat and then, after fitting them together, slides the seat edgeways under the beam and drives a wooden wedge between the chair seat and beam.

This process was replaced with hand clamp on account of its obvious faults, namely, besides being a one-purpose process it was laborious work driving and removing the wedges, the workman wasting energy in alternately stooping over his work and travelling back and forth to the glue pot, and finally owing to the percentage of open joints resulting from pressure applied only at the centre of length of seat. The hand clamp while they permitted of wider varieties of production and fatigued the operator less, still retained many of the disadvantages possessed by the wedge method.

Development of Dovetail Joints

With these difficulties in mind an ingenious inventor produced a combination jointing and gluing machine which automatically machined a tapered dovetail in one piece of wood and a tapered tongue



Power driven clamp carrier in factory of Langslow, Limited, Cobourg, Ont.

in the other, applied the glue automatically and, by a sliding motion, forced the two pieces together, thus gradually building up the panel to about the width desired, when it passed through the sizing saw to be

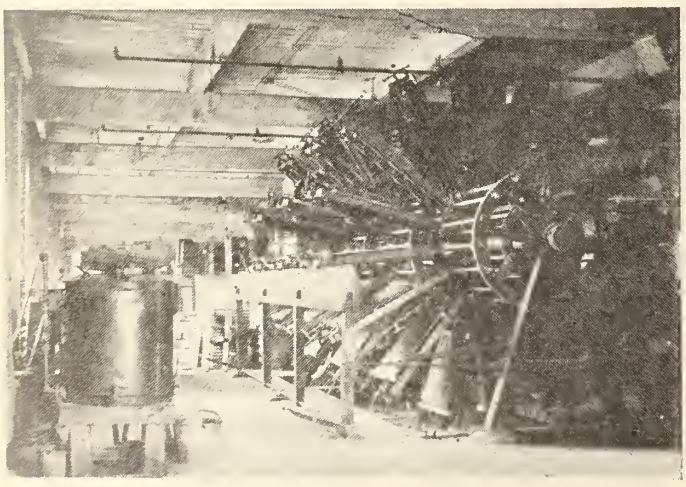
*Jas. L. Taylor Mfg. Co., Poughkeepsie, N.Y.

trimmed to the exact width. This machine was a big time saver over any that preceded it and although very expensive was rapidly installed in one factory after another.

Soon however, its disadvantages began to be apparent. The machine was very complicated, requiring one highly specialized operator, not easily replaceable, with two assistants to run it. If the glue was not of the proper consistency it was either pushed out of the joint when gluing hard wood or was absorbed into the soft wood leaving none in the joint in either case. In order to play safe 3/8" to ½" in width of lumber had to be sacrificed to the dovetail in each joint. Although this machine far surpassed any method yet produced for speed it produced a large percentage of open joints in spite of the effort to provide specialized operators to overcome the troubles which arose in connection with its operation. The machine being very complicated was very sensitive and was often down hours and many days at a time waiting for repairs, thus curtailing the production of the factory until the broken part was replaced. Although this machine is in use today in many factories and in some is giving satisfaction, the degree of success is due mainly to the skill of the operator and the character of the work. In general, however, manufacturers have realized that a big percentage of open joints result, and that apparent advantage of speed must be discounted by the time required to the work over again and keep the machine in repair; therefore, many manufacturers have already replaced this machine with a later improvement.

Clamp Carrier Placed on Market

At the time the combination jointer and gluer was at the height of its popularity inventive genious again conceived the idea that, as far as uniformly perfect joints were concerned, the hand clamps were superior to any existing machine, and therefore, set about to devise a new method that would speed up the process by eliminating the labor in connection with it, and finally brought out the clamp carrier. This machine is in principle an endless chain conveyor to which clamps are attached. It concentrated the manipulation of the clamps and work at one point so



Revolving type of clamp carrier

the workman was not required to travel back and forth across the floor. It raised the clamps to such a height as to enable the operator to insert and clamp up the work in a natural standing posture. It enabled him to make use of the small accessory glue roll by which he applied glue to all the jointed edges at once, and finally it enabled him to remove the work from the clamps after the glue had set at the same point where it had been inserted.

When provided with roller bearings this machine is easily hand operated as compared with the 25 or

Continuous feed edge jointer in North American Furniture Co's plant. Note warning on motor starting device

30 horse power required on the combination jointer and gluer mentioned above. For very heavy work on the very large machines an automatic power drive can be provided which at the outside does not require more than 2 h.p. motor. This machine is now manufactured to suit the requirements of the small as well as the large manufacturers, namely, 8 and 12 section wheel type 16, 20, 30, and 40 section chain type—4, 5 or 6 clamps per section for stock up to 42" wide and 6-½, 7-½ and 8-½ ft. long, the number of sections required depending on the character of the work, since only enough sections are required to allow glue to set before work is removed.

Cuts Costs and Raises Output

A brief consideration of the method of operation will indicate how the great speed possible with this machine is attained:—

1. Glue is applied to all jointed edges with one motion of the arms over the glue roll
2. Another motion of the arms slides the glued pieces one over the other onto the clamps.
3. The quick strong clamps then "weld the wood" —100% perfect joints.
4. And the succeeding set of clamps is brought down in front of the operator to receive new work.

The extreme speed possible is well shown by the records of Wood-Mosaic Co., of Louisville, Ky., who manufacture panels for the Victor Talking Machine Co. They have ten large Taylor clamp carriers in constant operation manufacturing chestnut, poplar, and oak glued-up stock, some of it made with a straight edge rip saw, some with a square and some with a "V" joint, according to the specifications of their customers. A week's production report from them dated last March, reproduced herewith, shows they are averaging between 20-½ to 24 revolutions per 40 section machine per nine-hour day and producing from a minimum of 1705 to a maximum of 3150 finished cores per machine and a minimum of 6528 to a maximum of 7827 surface feet of finished stock per machine per nine-hour day.

The same production can be obtained on solid work. In this connection it is interesting to note that a large

manufacturer of kitchen cabinets has gone a step further in cutting their gluing costs by taking their solid work directly from the chain feed rip saws to the clamp carrier, thereby eliminating the operation of jointing the work. It should be noticed that this is on solid work and produces very satisfactory results—results only possible because of the highly developed, strong individual clamps with which this machine is provided. Gradually manufacturers are coming to use the straight, flat joint in their work, having proved that it is reliable and is stronger than the wood itself.

A review of the clamp carrier would not be complete without a consideration of the "thick stock clamp" and "end clamping attachment," now found on certain machines. The former is applied to the carrier in the same manner as the regular clamp and is used for clamping built-up stock, having an extreme width capacity of 6-½". This clamp is provided with two draw bars to secure double the pressure and as tight a joint at the top as at the bottom. The end clamping attachment is used for applying pressure to the ends of the work at the same time pressure is applied to the sides and is widely used by piano factories in putting veneer on all four edges of their work at once and gluing moulding to the three edges of their key bottoms at once, by using caul boards to distribute the pressure and is being used for regular end clamping in other factories. This attachment does not interfere with the use of the machine for plain edge gluing.

Core Production Reports

Wood Mosaic Co., Louisville Ky.

Each unit comprises two 7½ ft. - 40 section Taylor Clamp carriers, each provided with 160-32" clamps. Two operators to each machine.

Makes Ideal Combination

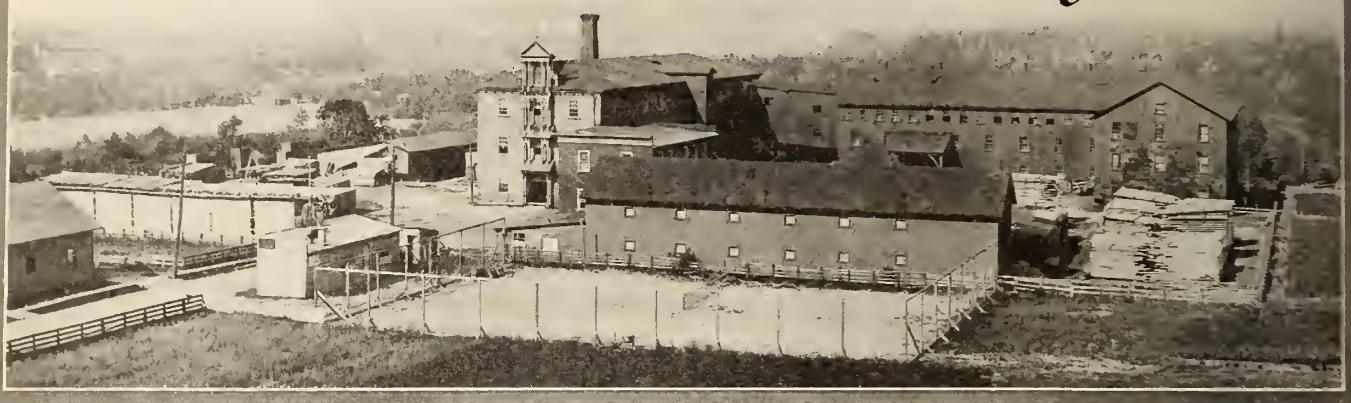
The clamp carriers represent the highest point of development of the art of edge gluing today, is faster then any other method, produces 100% perfect joints, requires a very small comparative investment and the upkeep expense is practically negligible. In the modern plant the clamp carrier is employed largely in connection with the continuous feed edge jointer or as it is sometimes called the automatic glue jointer. This machine is too well known to require a detailed description. The pieces to be jointed are carried over the cutter heads by a combination chain and roller feed works. The stock is held rigidly between rolls and chain and as the movement is a straight line the jointer is capable of doing extremely accurate work. By using special cutter heads practically all types of joints, such as square, "V", tongue and groove, etc., can be made. In some machines an adjustment is provided to make either straight or hollow joints. The pieces are fed through one side, turned over and fed back on the other side so that in reality two streams of material are going through continuously, tending for high production.

Some manufacturers have put this machine to special uses, such as squaring up dresser posts and the other thick material, running rabbits on door stiles for case goods, end matching certain stock and for running simple forms of edge mouldings. When put to special operations like this, suitable heads must be provided. It is often found that cost may be reduced considerably by putting various machines to new and original uses.

Sanding Wood Turnings

The sanding of wood turnings by mechanical means has developed to such an extent that it is possible with the modern type of special sander to clean up turnings of various kinds without losing any of the details. What this means to the manufacturer of turnings or to the manufacturer of furniture into which turnings enter largely, is hard to realize. One manufacturer of a general line of furniture found that one of these special machines for sanding turnings replaced six operators, who did nothing but sand turnings, and has resulted in a saving estimated at $12.00 a day. Another manufacturer, this time of four-post beds, stated recently that since he installed a special turning sander a little over a year ago, he considers it has paid for itself three times over in the saving on the cost of the sanding operation. Another saving made through the use of such special equipment is that by sanding down to the solid wood, removing all roughness and fuzz, the stock does not absorb nearly the same amount of varnish or finishing material,

A Picturesque Furniture Factory *with a Power Plant at its Back Door.*



On the Great St. Lawrence Waterway at Riviere du Loup the St. Lawrence Furniture Company Lives, Moves and Has Its Being. Remote from the Larger Industrial Centres, the Conditions under which it Operates are of more than Usual Interest. In this Article the Reader is Given a Brief Pen Picture of the Plant and Is Told Something of the Peculiar Advantages Which it Enjoys.

Ever been to Riviere du Loup?

If you know anything of the greatest waterway in the world, our wonderful St. Lawrence,—particularly if you have ever sailed out of Montreal or Quebec on the far-famed Saguenay River trip, you will know just where Riviere du Loup is, when we tell you that it is nearly opposite Tadoussac, on the south bank of the St. Lawrence River,—which is twenty-two miles wide at that spot.

Apart from the fact that the town possesses a woodworking factory which contains features of interest all its own, Riviere du Loup is no name to juggle with.

In the first place it has a population of 7,500,—and is therefore, a city, not a town at all!

Riviere du Loup is within hailing distance of Rimouski, the first point of contact one makes with home after a summer sojourn in the Old World.

Riviere du Loup is well-connected. It is one hundred and fifteen miles from Quebec, the Sentinel City of the St. Lawrence, and two hundred and sixty-eight miles from Montreal, the commercial metropolis of the Dominion.

But we are led back to our original reflection that Riviere du Loup is on the south bank of the St. Lawrence River,—opposite Tadoussac.

Tadoussac! That jewel of the St. Lawrence "where the flying fishes play," and where industrial excitement is forgotten in the wonders of Nature and the exhilarating environment of the place where river and ocean meet.

Don't miss Riviere du Loup if you haven't been there. Take a trip down the St. Lawrence on your next summer holiday. It will repay you.

A week or so ago, a representative of the "Canadian Woodworker" braved the winter storms, crossed over from Quebec City to Levis, and ran up to Riviere du Loup to look over the plant of the St. Lawrence Furniture Company. He had been told that it was worth while, and it was,—even in winter!

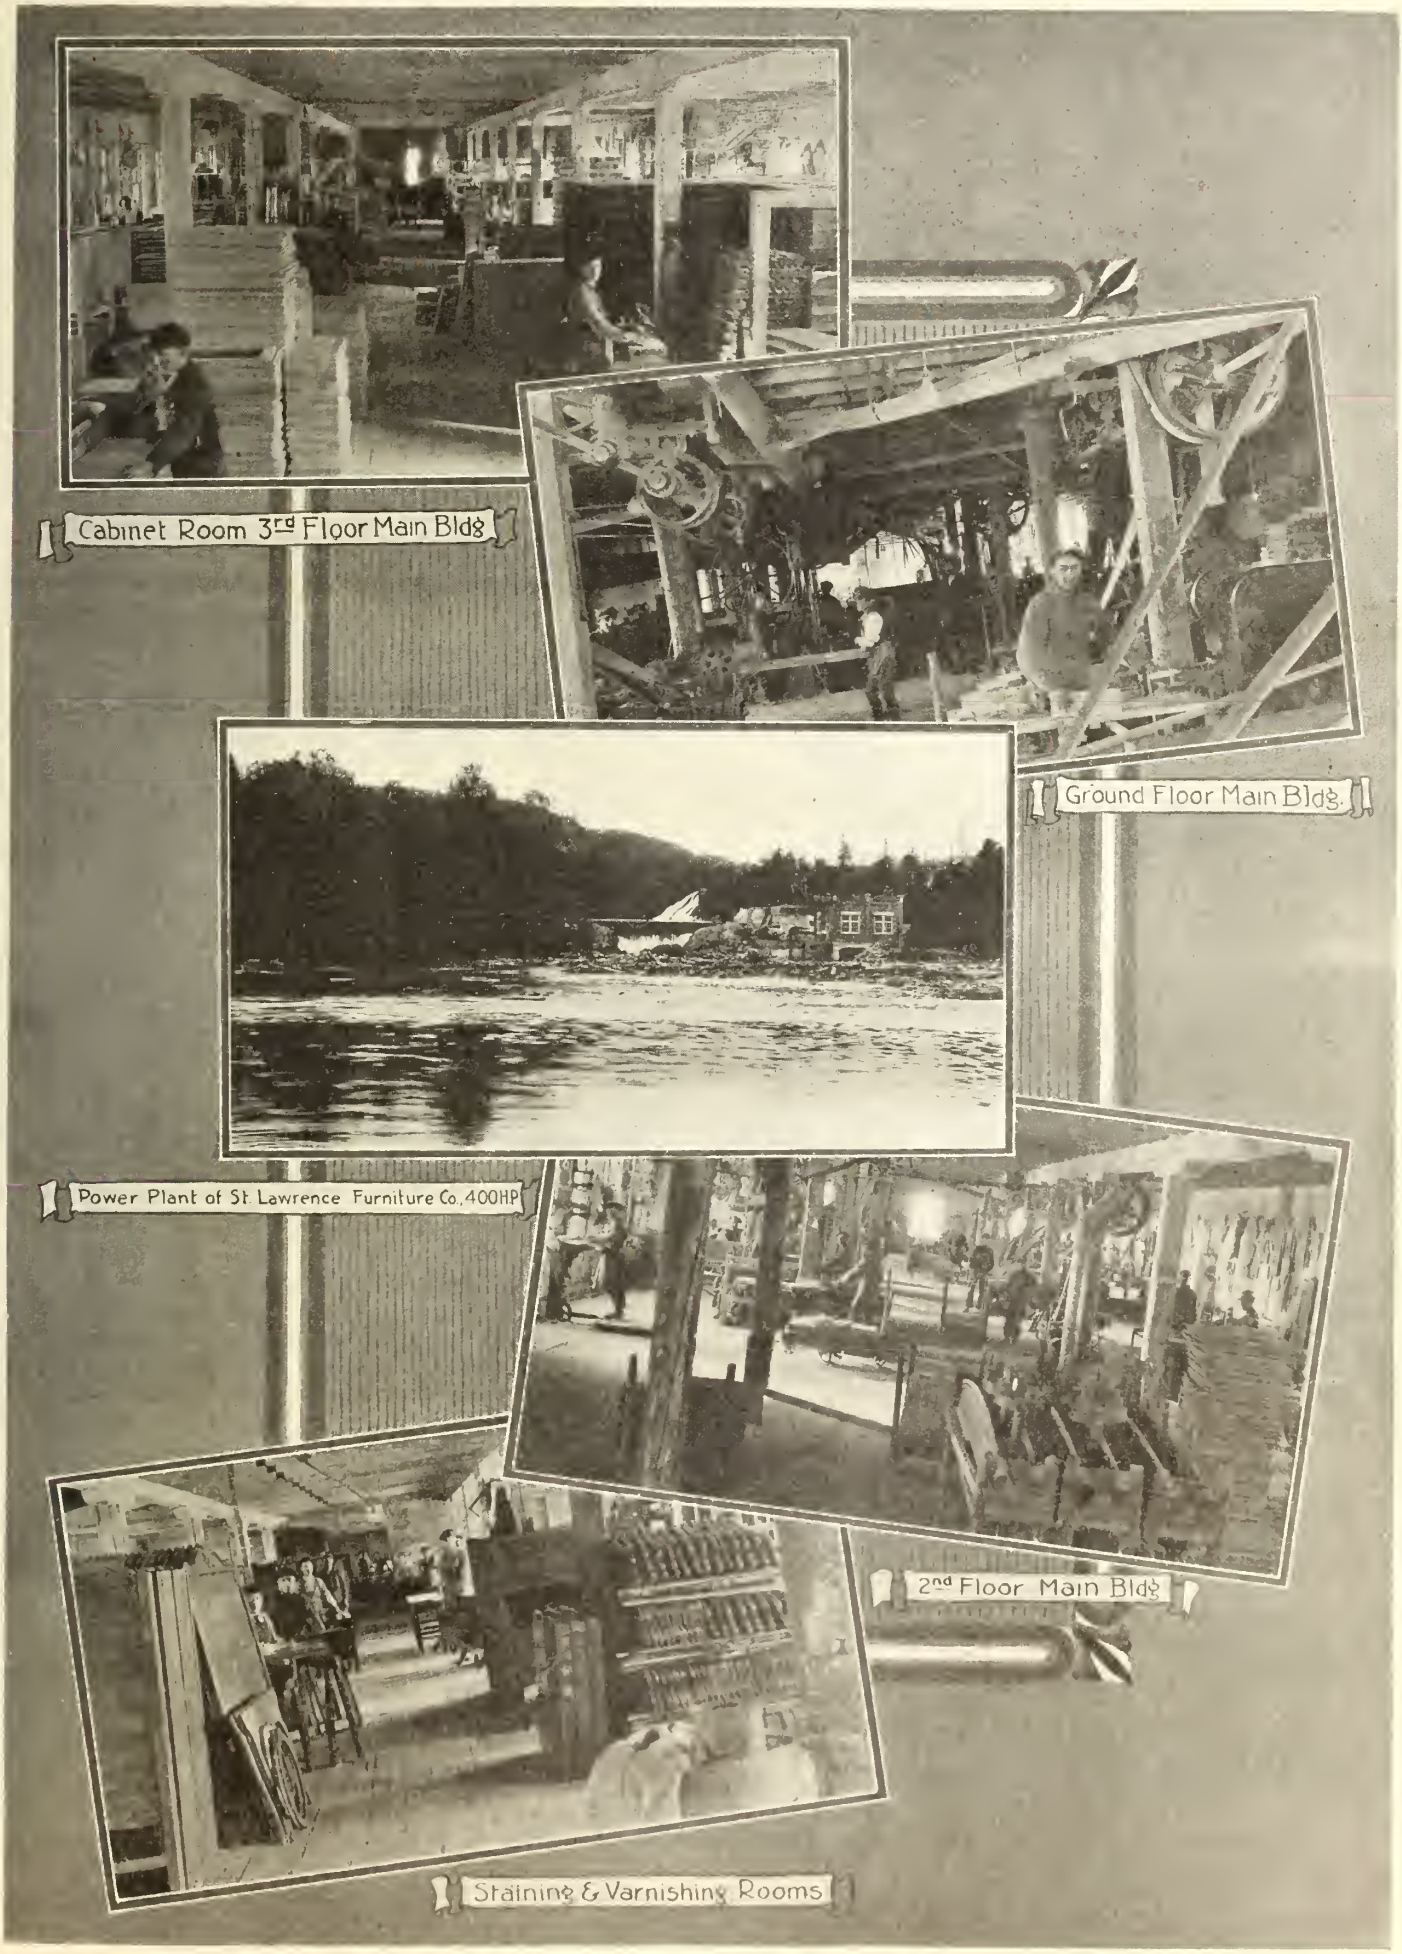
A Picturesque Location—With a Power Plant at the Back Door

An idea of the picturesque location of this plant may be obtained from the general view published herewith, and from the photograph of the company's power plant which is situated at their back door, only a thousand feet from the factory.

The development by this company of their own power is conspicuous among a number of advantages they enjoy. How many woodworking plants in Canada develop their own electric power? Here is a nice little problem for the readers of The Woodworker. We venture the opinion that the fingers of one hand only will be necessary in arriving at the solution. The power-house shown in our illustration is situated on the Riviere du Loup. The company develop over 400 h.p., of which they use 150 h.p. for the operation of their plant. Surplus power is thus available for two other factories—engaged, say in the manufacture of chairs and high-grade furniture.

Apart from the company's power development, the municipality have a plant at which they develop 2,500 h.p., electric energy being available at very low rates.

The St.Lawrence Furniture Company are engaged in the manufacture of cheap and medium grade household furniture. Their market is an extensive one—the territory stretching from Newfoundland to Vancouver. They specialize in bedroom and dining-room



Cabinet Room 3rd Floor Main Bldg
Ground Floor Main Bldg.

2nd Floor Main Bldg
Staining & Varnishing Rooms

suits, manufactured out of native hardwoods secured within a radius of one hundred miles of the plant. They have their own saw-mill, in which they cut some 500,000 feet of lumber each year—approximately one-third of the material used by the plant.

Factory Plan Facilitates Routing of Material and Provides Breathing-Space at the Same Time

From the general plan of the factory it will be seen that the plant enjoys many advantages. First and foremost is the manner in which the plant itself is laid out. While the various departments are not sufficiently removed from one another to interfere either with the routing of the material through the various stages of operation, or with efficient supervision on the part of the management, they are so placed that there is ample breathing-space and light in every corner of the industry.

The advantage of locating a factory where plenty of land is available at a reasonable figure needs no elaboration. Only too often the problem of space in city districts make it necessary to sacrifice health and efficient working conditions to considerations of production and productivity—within the narrow con-

A product of the St. Lawrence Furniture Co.

fines of a limited area which stunt both growth and enterprise. In such factories as the one at Riviere du Loup, healthy conditions and effiiciency go hand-in-hand with maximum production—and there is always room to grow.

Little explanation is required of the general plan to which we have referred. In the centre there is the main building,—of brick construction; on the left the Kiln Sechoir—dry kiln; on the right the stabling and warehouse for dry lumber; and in the middle background there are the varnishing and shipping departments. Piles of lumber uniformly arranged at sufficient intervals to admit ample ventilation and drying space are grouped around the buildings. The lumber is seasoned in the piles for a period of twelve months and at the end of that time goes to the kiln, which is a modern moist air dry kiln (capacity 40,000 feet of lumber) by Sturtevant.

The total floor space of the plant is approximately 70,000 spuare feet, of which area 25,000 sq.ft. are contained in the floor space of the main factory, where all the machinery is located.

The main building is solid brick, three storeys high. Light, airy offices and show-rooms are situated on the main floor annex, while there are sample-rooms on two floors.

The breaking out of the lumber is done on the ground floor, which is well equipped with the latest improved makes of machinery. The superintendent's office and drafting room are also on the main floor. Here, too, there is a machine shop where repairs of every description are made.

A dust and shavings exhaust fan, situated on the main floor, takes all the sawdust and shavings to the boiler and thus contributes an important element of efficiency in clearing the atmosphere and in preserving the life of the machinery.

The accompanying photograph of the second and third floors and working efficiency, location of the machinery and stock reveal careful planning. There is no congestion, no delay: from the raw material to the finished product is an uninterrupted and direct sequence of operations.

From the second floor, after the inspection of the veneer presses and the operation of that department, we pass to the third floor, which is the cabinet-assembling floor. Here there is a complete equipment of buzz planers, disc and drum sanders, veneer presses, and so on. This is where the graining is done.

From the third floor the goods are taken to the staining room and then on to the varnishing room, both of which are 100 feet by 40 feet in dimensions. A Mattison electric polishing machine is conspicuous in the varnishing room.

The plant is fortunate in the possession of ample shipping facilities both by land and water. It has two rivers—the St. Lawrence and Du Loup—and two railroads, the Temiscouta and the Canadian National. The company have two motor trucks for the loading and unloading of their cars.

An efficient fire alarm system is situated in this building, direct connection being made with the city system. The municipality provides a water pressure of 125 pounds to the square inch. Stand pipes and hose are provided on each floor. The company enjoy a clean record in respect to fires—either great or small.

Under normal conditions the St. Lawrence Furniture Company employ a staff of one hundred hands. During the war they operated to capacity day and night for three years making shell-boxes on Government contracts.

Mr. Mailloux, the Manager, is optimistic concerning the future and anticipates a greatly increased output upon the resumption of constructional development—particularly house-building, which he regards as no longer possible of much further delay.

Twenty-One This Year: A Man-Sized Plant

Mention of this firm is particularly appropriate at this time in view of the fact that it is just attaining its majority. The St. Lawrence Furniture Company was founded in 1901 by Mr. Octave Laurin, who became its President and Manager and died three years ago. Mr. Laurin was succeeded as Managing Director by Mr. J. H. Mailloux, who has had upwards of a quarter of a century in the furniture-making business and has been with the company since its formation.

The Superintendent of the plant, Mr. H. Desrosiers, is an old and experienced hand in the woodworking business. He has been with the firm twenty years, and he can tell you of the early days of furniture manufacturing ten years before that. A connection

Officials of the St. Lawrence Furniture Co., Limited, Riviere du Loup, P.Q.

of no mean standing is that of Mr. J. L. Beaulieu, the Secretary, who has been with the company seventeen years. J. L. started in as an office junior and is considered to know something about book-keeping and finance.

The present directorate consists of Mr. Jos. Viel (President),—who by the way is Mayor of Riviere du Loup; Mr. J. H. Mailloux, Managing Director; Mr. J. L. Beaulieu, Director and Secretary-Treasurer; Mr. Nelson Carson, Vice-President; and Mr. H. P. Monsarrat, Director.

Our friend, Mailloux, will tell you that they know nothing of labor troubles at Riviere du Loup. Plenty of help is available, comfortable homes are obtainable at low rentals, and the "city" is sufficiently removed from the whirl of the large industrial centres to escape their temptations. It's early to bed and early to rise at Riviere du Loup! The workers there have their own community life and are happy in it.

Thus the plant whose history and operations are reviewed briefly in these columns is noteworthy by virtue of advantages seldom enjoyed in their entirety by larger competitors. It is a pleasant picture—a well-lighted, well-equipped factory operated by an efficient and contented staff—a factory situated in the heart of a picturesque district which yields raw material in abundance and supplies the power to turn that raw material into the finished product of household furniture.

The St. Lawrence Furniture Company's plant is a conspicuous example of French-Canadian business enterprise at its best.

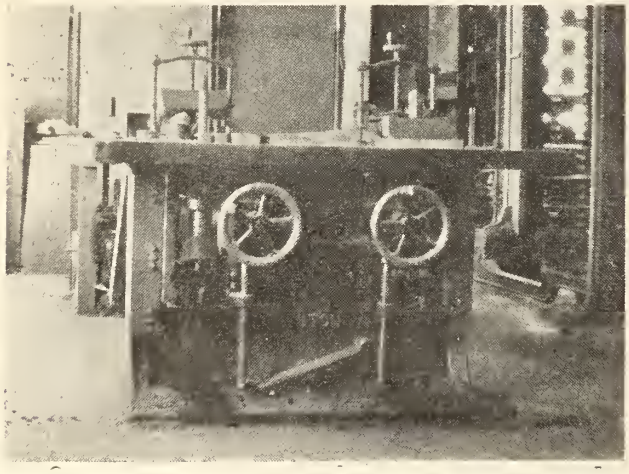
Doubling Up On Shaper Operations

Increase in Spindle Speed Has Worked Transformation—Works Well Either With or Against the Grain—Smoothness of Cut Reduces Sanding—Comparison With Slower Speed Machines

By C. H. PRATT

During recent years the humble shaper has come into greater prominence as an efficiency, production machine, the development being toward heavier machines with high speed, rigid, non-vibrating spindles. As the advantages of high spindle speeds were demonstrated and higher speeds were demanded, it was found that the older types of bearings would not stand up under the added strain. As a consequence a resort was made to ball bearings which had proved their ability to stand up under unusually high speeds. The result is that to-day there are many makes of ball bearing shapers on the market, ranging in speed from 7,000 r.p.m., to 12,000 r.p.m. and even in some cases to 15,000 revolutions per minute.

Naturally the first question asked by the practical man is,—Why such excessive speeds and what are



Double spindle, ball-bearing shaper in Malcolm & Hill plant, Kitchener

the advantages accruing? It has been found that a high speed shaper will cut considerably faster than a slower-running machine, in some cases more than twice as fast and that the cut is smoother, requiring considerably less sanding. All this means increased production from both the shaping and subsequent sanding operations. In fact, the efficiency of the rapidly-revolving shaper spindle is so high that it has been found practical to build a single spindle machine for ordinary forms of variety work. This cuts with equal facility either with or against the grain. This must not be taken to mean that the cut made against the grain will be as smooth and perfect as the one run with the wood, but the edge finished against the grain will be found to be smooth enough to require very little sanding. In demonstrating this point a triangular piece of wood is shaped on the three edges without losing the corners.

How Time is Saved

Another advantage of high cutter speeds is that a heavier cut may be removed. This means that when shaping to forms it is not so necessary to band-saw to the approximate size as is the case with the slower-speed machine. In many instances the band-sawing operation may be omitted entirely, the work being performed on the shaper right from the rough planks. This saving, taken in conjunction with the increase in output, demonstrates just how efficient the ball bearing shaper is.

A manufacturer operating three different makes of shapers,—a plain babbitt-bearing shaper with a maximum speed of 5000 r.p.m., a bronze-bearing shaper running at 6000 r.p.m., and a ball-bearing shaper with a speed of 7500 r.p.m., decided to make a test on three machines to see how one compared with the others. One man used all three machines on exactly the same kind of work for a stated length of time. As he moved from the slow speed to the high-speed machine, the quantity as well as the quality of his work showed a marked improvement. Under this test the ball bearing shaper turned out twice as much work as the babbitt-bearing machine, and the product had a much better finish. Another instance is where a manufacturer found that on a certain class of work it was necessary to remove from ½ to 1 inch of stock. With the old machine it was often necessary to cut this material away on the band saw, and even when this was done, the work was rough and required considerable sanding. With the ball bearing machine it was found that this work could be run through without any band sawing and the resultant cut was so smooth as not to require any sanding.

Sanding Operation Lightened

The cost of sanding is no small item in connection with shaper work. Often it is very much more than the cost of the shaping itself. With the high speed shaper this sanding is to a great extent eliminated, which in itself is a very important feature. In some plants it is estimated that 75 per cent is saved on the sanding operation alone.

While power consumption may not be of very great importance, yet a saving is made here as well. In plain bearings it is estimated that from 60 to 70 per cent of the power delivered by the belt is lost in overcoming bearing friction. Ball bearings reduce this loss by about 65 per cent, which means a saving of from 40 to 45 per cent in power used. This means that where 5 h.p. is required to run a double spindle shaper, fitted with plain bearings, 3 h.p. would be all that is needed for the same machine when equipped with ball bearings.

In view of the above facts, it would appear as if with the ball bearing shaper, production is increased, the quality of the work improved, less sanding is required, the power consumption is lower and finally but not the least important, bearing troubles are reduced.

Elm-Wood Works, Winnipeg, Man., was recently organized to conduct a general woodworking business. The two partners are W. C. Tidball and A. Doloway, both of Winnipeg.

Basic Time Standards---Their Relation to Production, Cost Accounting and Estimating

Eliminate Guessing from Many Phases of Woodworking Management and Place Industry in Position to Carry-on with Greater Degree of Assurance

By Wm. SNAITH, C. E., Associate Engineer, Forest Products Engineering Co., Chicago

Nothing can be measured accurately without a measure or standard. We measure lumber by the board feet, iron by the pound or ton, water by the pint or gallon. We understand very clearly how much lumber we expect to get when we specify so many thousand board feet, and we can determine more or less readily how many board feet will be required to build a buffet, table, door or sash. Knowing the cost of our lumber we readily arrive at our material cost. No one would consider it an accurate estimate of the material in a dresser if the estimator figured that because there was so much lumber in a dresser made last year a new design would probably require so much more. Such an estimate would only be a guess and should be labelled as such. Most of the estimates in some such hit-or-miss fashion and amount to nothing better than a guess. It is only fair to say that many of these guesses come very close to the actual cost.

Even when these guesses are backed up by the records of past performances supplied by an accurate cost system they still lack the positive quality of the estimate of material. Furthermore it would make little difference what kind of a factory the work was to be done in the amount of material would not vary to any great extent. This would very emphatically not be the case in the matter of labor. The nature of the equipment and the methods of doing the work would affect the cost to a very marked degree. It is quite possible, knowing certain readily ascertainable facts about the available machinery for doing the work to determine how many hours of labor will be required for the various machine processes, for assembling and finishing. Such an estimate involves a certain amount of work to prepare but it has the merit of being extremely accurate.

Value of Knowing Costs in Advance

Accurate estimates of future costs are destined to be increasingly valuable. Many lines which have to be sold at a loss would never have been manufactured had the maker known what the final cost was going to be. In an era of generally falling prices it will be a much more serious matter than formerly to absorb such losses. It will pay to spend a little more on clerical work if thereby unprofitable lines can be prevented.

Estimates are useless and misleading unless the cost of the work is kept within them. Cost records are almost equally valueless if there is no certainty that costs will not be increased the next time the article is made. It is not enough to know that the cost should not exceed a certain figure if steps are not taken to positively prevent such a thing happening. In a plant with a very excellent cost system which accurately records actual costs with a surprisingly small factor of error it is more or less common for costs to fluctuate from 20% to 50% and even higher in some of the departments. These fluctuations occur in spite of the fact that they are always the subject of investigation. Naturally this prompts the query as to what variations occur where the cost system is only partially complete and accurate, and further when there is no real cost system. It becomes easy to understand the discrepancies disclosed in recent numbers of the "Canadian Woodworker" in estimates of sash and door costs.

Of course there are plants where it is a point of honor to keep the office staff down to a minimum—in every sense of the word. In the conditions existing in a period of expansion such plants may not only exist but even have a modified share of the general prosperity thrust upon them. In times of deflation and reconstruction these are the first concerns to go to the wall. They are followed by those whose methods are slipshod and who deceive themselves by inaccurate methods of accounting and cost accounting so that inefficiencies of manufacturing and merchandising are not brought to light. Among these concerns are those which have tried to carry on with the same overhead as in good times and without adequate retrenchment in other expenses. Over-staffed and not securing either quantity or quality of work in proportion to the wages expended the balance sheets of such firms tell a story which is not likely to have a happy ending.

Do Woodworkers Lack Business Acuteness?

There are not as many woodworking firms as there should be up among the leaders in modern business methods. Genius, they say, is an infinite capacity for taking pains and the clerical work involved in modern methods means the taking of no little pains with a variety of details. The success of the leaders is built largely on the genius and courage which digs deeply into fundamentals and despises not the day of small things. Minutes saved in minor operations and waste motions eliminated loom large in a balance sheet after being multiplied many fold in a twelvemonth. Too much emphasis can not be laid on these facts because of the disposition of those unfamiliar with the type of records called for in scientific management to regard them as excessive "red-tape". As a matter of fact the actual time taken from productive work is really less with properly designed production time tickets than is generally the case when the workman reports his own time on a single slip of paper towards the close of the day, distributing his time over the various jobs worked to the best of his recollection and in any case so as to forestall criticism as far as possible.

If production costs can be cut down the profits of good times can be equalled if not exceeded in the present lean years. Here we enter the province of

the industrial engineer and any study of modern methods would be incomplete without a consideration of the contribution to cheapening and increasing production by the engineer. Woodworking is one of the last great branches of industry to attract the services of the engineer, and the extent to which it will benefit is only beginning to become apparent. The engineer, by training and experience is led to delve deeply into fundamentals, to take nothing for granted. In the words of scripture he "Proves all things, holds fast that which is good." The human element is not neglected in the analysis of the problem and the result is a solution which is not coldly mathematical and theoretical, but intensely practical.

Wage Payment on Definite Basis

The foundation of scientific control of production involves several distinct steps. After an analysis of the product and the available means of producing it, the materials and methods as well as the product are standardized to the fullest possible extent. The problems of each individual plant are different and no system could be devised which could be transplanted bodily from one factory to another. Principles do not alter, but there is infinite variety in their application. The principle of reward in proportion to effort is cardinal in securing maximum production. In practice this involves the use of piece work or a bonus system, preferably the latter. The Earned Hours, or Earned Time Plan of the Forest Products Engineering Company, recently described in the Canadian Woodworker, retains all the advantages of the day-work system without the disadvantages which make that system unfair and unworkable. At the same time it is essentially different from straight-piece-work with its obvious disadvantages.

In this plan the worker is given an hourly rate and guaranteed his nine or ten hours per day. The work is estimated to take a certain time per hundred pieces and the worker is credited with all the time earned and is paid for the "earned hours" when they exceed the clock hours. The determination of the rates or standard times for the various operations is the result of careful time-study observations and comparison with other data. The whole system rests on the foundation of these time standards. On this foundation a great deal of building can be done. Their application to estimating was hinted at in the opening paragraphs and when so used the accuracy of an estimate of the labor on an article as complicated as a buffet or dresser will equal the accuracy of the estimate of material in it. Further, such an estimate will not amount only to a general idea of what the article ought to be manufactured for, it will represent exactly what that manufacturer will pay his own men in his particular plant for doing that certain piece of work. This ties estimating and cost accounting together in a perfectly satisfactory way.

Studying Possibilities of New Equipment

In considering the purchase of new equipment the manufacturer again falls back on basic time standards. He knows the speeds and feeds of his present machines and he can compare rates based on these with others based on the specifications of the machine he proposes to buy. As long as he has even an approximate idea of the number of hours work he will have for the machine in the course of a year he can determine whether the investment will show a profit or not. It is a common experience to find the machine salesman's promise of a 50% or 100% increase in production not at all substantiated after the new machine is installed. That the machine is better than the one it replaced may be admitted, but the fact will remain that the increase in production is discouragingly small, nothing approaching the 50% promised. The explanation will lie in the nature of the work done. Perhaps a few figures will serve to make this clear. Consider a machine such as a shaper in which the operation consists of the two elements, handling and cutting. Let us concede that the new machine will cut twice as fast as the old one. Assume that the handling time is the same in three cases, but that the cutting time is .08, .32 and 1.40 minutes for the old machine and half these figures in the new.

Old Machine		New Machine	
Handling time	.16	Handling time	.16
Cutting time	.08	Cutting time	.04
	.24		.20
		Saving 16.7%	
Handling time	.16	Handling time	.16
Cutting time	.32	Cutting time	.16
	.48		.32
		Saving 33.3%	
Handling time	.16	Handling time	.16
Cutting time	1.40	Cutting time	.70
	1.56		.86
		Saving 45%	

Since the time for setting-up and trucking, etc. would be constant and the same in both cases the actual saving would in fact be less than the figures given above. The point the buyer would have to consider would be how much of his work would consist of small pieces with short cutting times. Here the saving is small and unless the machine were constantly in use there might be no return on the investment. While the possible saving with long cuts would fall short even of the promised 50% increase it would still represent a decidedly profitable investment.

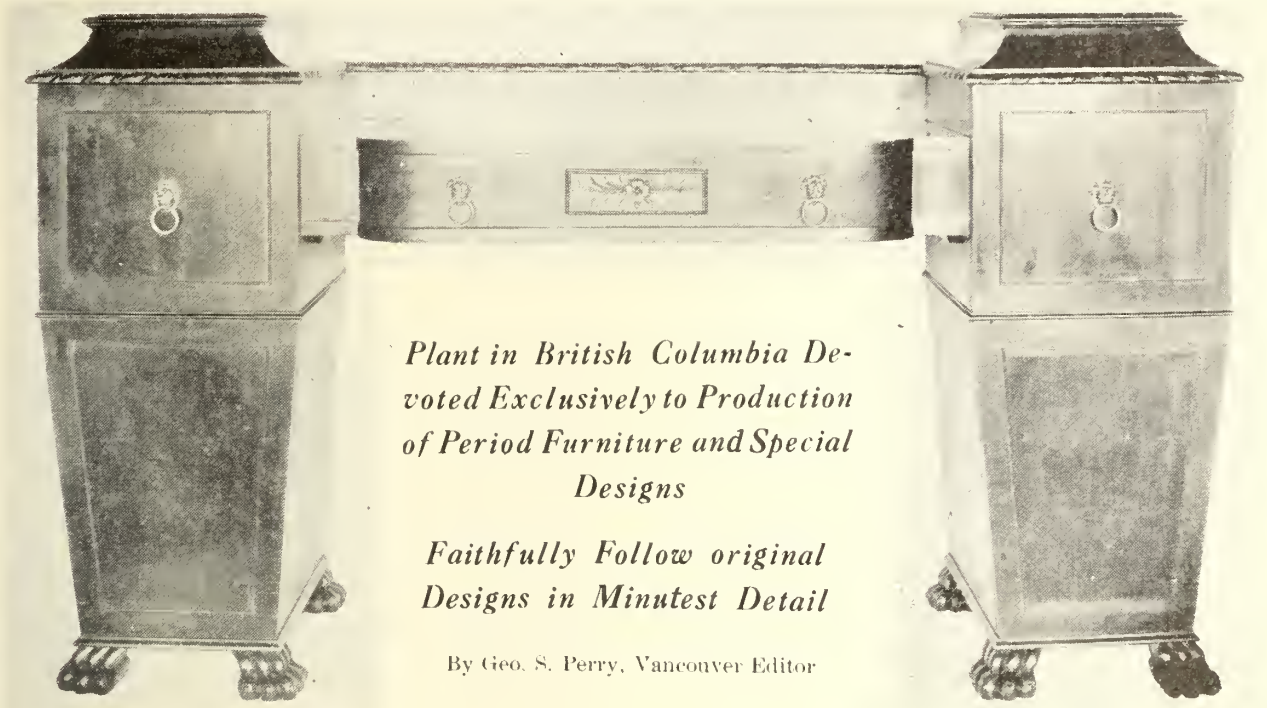
Accurate Knowledge Basis of Changes

In arriving at the most economical routing of work there is frequently room for doubt as to the machines to use. Here again a few calculations with basic time standards will give the solution. Lay out both routes and calculate the times for each set of operations and the one which shows the least time will be the most economical. When changes in design or routing are to be considered the exact effect they will have on the cost of the article may be readily figured and whether the change will be profitable may be known before it is authorized.

Time standards are but one of the instruments or tools devised by the engineer for the manufacturer to use and as outlined in the foregoing paragraphs many uses already are made of them besides the original purpose for which they were designed. They are of the nature of foundation work which is ever unspectacular and always involves digging and all that is implied in the word. The foundation they afford is exceedingly safe and solid. It is worthy of the kind of structure which leaders have built in all times.

The fret saw is only a small machine, but if it is not fastened securely it will set up a considerable vibration much beyond its size.

Modern Factory For Hand Made Furniture



Plant in British Columbia Devoted Exclusively to Production of Period Furniture and Special Designs

Faithfully Follow original Designs in Minutest Detail

By Geo. S. Perry, Vancouver Editor

"Modern" usually strikes a sharp note of contrast with times and methods that are past. But if the word means something of the present time, then one Vancouver furniture shop can claim the paradox of being "modern" while working on methods associated with the early days of the industry. Entirely hand made is every piece turned out from the factory of the D. C. Timewell Co., Ltd., Vancouver, B. C., where thirty skilled men, most of them trained in old country shops in their various branches of the cabinet maker's trade, are constantly busy on choice specimens, reproducing faithfully some of the very best designs of every period.

The Pride of Workmanship

The contrast with modern furniture factories, where labor-saving machinery enables quantity production at low cost, is made sharper by the fact that the Timewell factory has scarcely any machines. Four or five, such as small bandsaw, planer, spindle machine, turning lathe and rip-saw, covers the entire plant operated by power. These are used to facilitate the various hand processes, carried on by the skilled craftsmen. A jig-saw for fret-work may be added, but beyond that the company does not plan to extend their use of machinery.

"There is incentive to a man, when he is handed a working drawing of a piece of furniture and he sees the finished product of his handicraft result from his effort and skill," said Geo. Laidler, member of the firm and superintendent of the factory, discussing and describing the methods of work in the business. "Practically every order is special and individual. In most cases no repeat orders are likely. In fact we have a trade which demands exclusive work.

"It is interesting to follow the inception of an order from the first idea of the customer or suggestion from ourselves. Often a rough sketch, giving the general form of the piece or a set of furniture is all we have to work on. Occasionally a photograph or a published design is brought to us, and quite frequently a single piece of old furniture is sent in by the customer. At other times, we are asked to submit a finished sketch for approval. In every case," said Mr. Laidler, "before working plans are given out to the cabinet-maker or wood-carver, we make a sketch showing the appearance of the piece desired. The correct detail for every period or design is adhered to strictly."

"How about material used?" we asked.

"None but the best grades of the special cabinet woods required for each piece are used," said Mr. Laidler. "We make every piece 'solid', so that there are no veneered or faced frames. In the interior work of dressers, sideboards and tables we use yellow pine, tops and fronts as well as the frame are solid wood, whether Honduras mahogany, black walnut, oak or other wood is used."

Jacobean Always in Plain Oak

In the factory when visited, work was proceeding on a complete dining suite of Jacobean design, in heavy oak. One detail pointed out, to show the care in following correct canons, was that no quarter-cut oak was used. "It was not known when the design was first made," was the comment. Two men were busy on the heavy

sideboard, another was at work on one of the two arm chairs, others were making the dining table frame, and in the upholstery department swift needles were fashioning the padded back of the other arm chair. It was interesting to find that one of the employees of the factory was the designer and owner of a special machine, combining a lathe and a spindle machine in one, for turning out at one operation the distinctive twisted legs for chairs, table and sideboard of this Jacobean suite. The man had only completed his machine two months ago. Prior to that the Timewell factory had had the work on all such pieces done by hand, execpt once when they had obtained a set of spindles from an Eastern Canadian factory. The employee is encouraged by being given piece work orders for all these Jacobean legs and he keeps his invention at home in his basement where he does his work.

A silver cabinet, carried out to suit a customer who had handed in a very rough sketch with a few verbal instructions, was an item being made at one bench. In another corner the arms of a Sheraton settee were being shaped. Up in the varnishing room, the finishing touches were being given to a pair of twin beds in dark stained mahogany to match a wide bed sent in by the customer. Cane panels were being put in the head and foot boards, and an exact reproduction was being achieved. One of the lines on which the Timewell factory finds itself often called to work is where a family has divided up an old set of furniture, heirlooms prized perhaps for generations. One or more members may wish duplicates of the original pieces and here a faithful copy is called for. Many rare pieces of old furniture have come direct from the old country to British Columbia and these are frequently sent in to be copied and in some instances to be restored.

Another interesting feature of the demands made upon this unique factory is when a big furniture store in Vancouver or Victoria asks to have an additional piece made to add to some expensive set they have in stock, and which it would cost more to have specially shipped from the original factory. Sometimes too, prospective buyers ask to have an additional piece of uniform design added to a set on display in a show room of a down town furniture store. Many such orders gravitate to the Timewell factory.

Has Enjoyed Steady Growth

Starting in a modest way ten years ago in Vancouver, D. C. Timewell, founder of the company, from the first paid special attention to hand work. An upholsterer trained in the Waring & Gillow shops in Liverpool, England, he knows every part of the business. Geo. Laidler, his associate from the first, has a training as cabinet maker received in big shops at Newcastle on Tyne. Up to two years ago the company continued its business in premises attached to its down-town show-rooms. For the past two years all manufacturing has been carried on at the factory on Dufferin Street, where the company owns the building, and also has additional ground space to erect an extension. Steady increase has marked their progress, and the building up of a staff of thirty hands has been no small task, as each man is trained for some special line of work. Almost all were trained in old country shops where more hand than machine work was the rule. To prepare for further increases in staff and to provide against shortage of trained help, the company has a policy of training up its own men, and a number of lads who have been learning their trades in the factory for some time, are already advancing to the position of skilled workmen. In this way a sufficient supply of the right kind of help is being insured, while incidentally teaching some young Canadians skilled trades they are always sure of employment in at good rates of pay. "We pay a little over the union scale and stick to the eight hour day, and we find that we get the very best of results and co-operation from our men," commented one of the principals.

Do Your Own Thinking

For fifteen years, old Tom Smith had been running the pumping engine at Brown's Falls. For fifteen years old Tom climbed up twelve feet on a ladder every day to squirt oil in a little hole in a valve-motion rockshaft.

One day he slipped and nearly fell. The Superintendent saw it and investigated.

"What were you doing up there?" the Superintendent asked.

"Shot a little oil into that hole up there."

"What hole?" returned the Superintendent.

Tom showed him.

"Why man!" exclaimed the Superintendent, "that's no hole; that's only a lathe center—what they turned the shaft on when they made it!"

So it was. We all know how old Tom felt when he found out that the hole he had faithfully oiled so long was only a blind alley. That's the difference between men—some use their brains and some don't.

That's the difference between the Tom Smith and the Tom Edison type of man. The fellow that does his own thinking gets paid for it.

Did it ever occur to you that the man who needs much supervision pays for it?

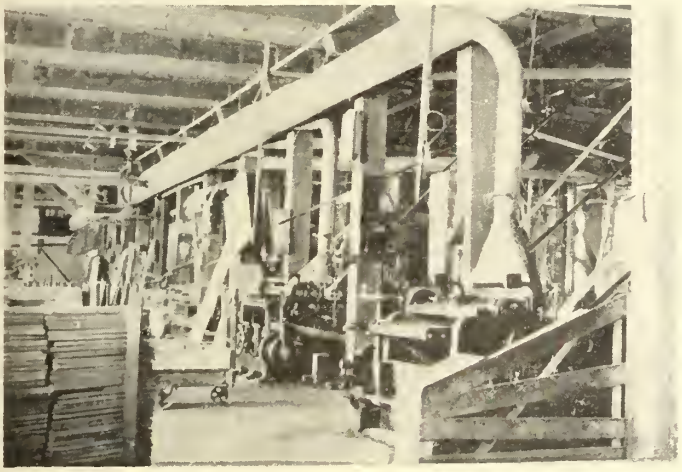
He certainly does. He pays the difference between what he might be getting and what he is getting paid for his work. The more you know and the more thinking you can do for your work, the more you are eventually going to be paid. Then,too, the more you know and the more thinking you can do for your boss, the sooner will he put you where you can supervise the work of others and be paid accordingly. Do your own thinking!

The man whose main aim at work is the weekly stipend will never get anything else unless old good luck takes a liking to him.

The Customer is Always Right

Good-will of Buying Trade Desirable Asset—North American Furniture Company have built Substantial Business on This Foundation—Plant Well Organized and Equipped Welfare and Comfort of Employees Not Overlooked

More than one successful business has been built on the premise that the customer is always right. Without regard to the character of the complaint or the merits of the case, the customer's story is accepted at face value and a satisfactory settlement made. That this policy is productive of a large volume of business, has been amply demonstrated in the case of the North American Furniture Co., Limited, Owen Sound, Ont., which since its inception some ten years ago, has lived



General view in plant of North American Furniture Co., Limited, Owen Sound, Ont.

up to this principle in a most liberal manner. Naturally it presupposes a well-designed, honestly-made product, for it would be ruinous for any concern to even attempt to stand behind a line that was fabricated in a careless, slipshod manner or which could not be counted upon to give satisfaction under average conditions.

In discussing their policy with the "Canadian Woodworker and Furniture Manufacturer," the manager, J. A. Minchner, intimated that the retail furniture dealers appreciated this attitude on the part of the North American Furniture Co., and that with one or two exceptions there was no evidence of any attempt to take advantage of this policy. In the case of the chronic kicker, when once it was found impossible to satisfy him, a polite intimation was forthcoming to the effect that his orders were not looked upon with favor.

Comparatively Young Organization

The North American Furniture Co., Limited, was organized in 1910 and has made steady progress from the first. Today it is recognized as one of the most progressive furniture manufacturing industries in Canada. The building and the equipment is thoroughly modern, the factory itself being an imposing four-storey structure 400 x 60, well lighted and having exceptionally high ceilings. These features tend for greater comfort and convenience on the part of the employees as well as having a desirable effect on production.

Before selecting the machinery, a thorough study of the methods and equipment of some of the best American furniture factories was made, and the knowledge thus gained was put to good advantage. Some of the principal machines are as follows:— Double-end tenoner, automatic turning lathe, stickers, single and double surfacers, sanders of various types, ball bearing shaper, automatic glue jointer, revolving clamp carrier, band saws, resaw, three DeVilbiss sprayers, etc. This equipment is so arranged that a semblance of straight line production is secured, all the stock moving in one direction.

Raw Lumber is Conserved

The kiln consists of five compartments 35 x 80 feet, each compartment being used for a different wood. In this way each wood receives special treatment, as it should. The cars of dry lumber are first permitted to cool and set and then are run into the breaking-out department, which is at the far end of the factory. A slight drop in the tracks makes it easy to move the cars. In the breaking-out department there are three sets of swing cut-off and power feed rip saws. One cuts nothing but high-grade stock, such as gum, walnut, etc., another handles all the core material, while the third set handles all the crating and other rough material. One advantage of this is that the men operating each set specialize in one phase of the work and are thus able to handle the stock coming to them to the very best of advantage. It also permits of an efficient arrangement of the equipment, for the bulk of the stock from any one set of saws goes through practically the same operations, permitting the equipment to be placed accordingly. Thus one finds the automatic glue jointer in line with

Employees rest and cloak room fitted up by North American Furniture Co., Limited

the saws handling the core stock. As a result handling costs are kept very low.

As the machined stock reaches the far end of the factory, it is taken to the assembling floor and from there to the finishing department by a special elevator.

This particular conveyance is used entirely for handling material between floors. To avoid confusion and delay, another elevator has been provided to carry the completed articles to the shipping floor. This gives a slight indication of the efficient lines along which this plant is organized.

Plant Organization Not Overlooked

Mr. Minchner is a firm believer in systemization, but sees the danger of over-organization with its accompanying red tape. As might be expected, the work moves along freely and smoothly, without the use of multitudinous forms, yet production is always under close control and every phase of each operation is subject to close check. A special perforated form accompanies each order as it starts through the plant, and as it progresses from department to department, the particulars are noted and a section of the form filled in, torn off and sent to the office. This information is entered in a book, which shows at a glance just how far along each lot is. In case something is required in a hurry, it might be a complete order or just some one part which may be holding up an order, a special, red rush card is attached. Anything bearing this card is given precedence over all other work and put through as quickly as possible.

Form used to check progress of different orders

In the finishing room in order to maintain uniformity in shade and tone, special panels have been finished in what might be termed standard shades. These are kept prominently before the finishers and enable them to compare their work with the standard. These panels are about two feet by three feet, and sets showing the different woods and different finishes are found here and there throughout the finishing room.

All veneering is carried on in a special department. The veneer and crossbanding is carefully stored in racks in a dry, well-ventilated room. The usual run of veneer equipment is found, such as glue spreader, hydraulic press, taping machine, etc. A large hot box heats the cauls and other material before gluing, none but animal glue being used. After the veneered work has been removed from the retaining clamps and allowed to air-dry slightly, it is placed in a special panel-drying kiln and all the remaining moisture is removed. This kiln is kept at a temperature of 110°. Ventilation is maintained by means of a fan. The stock remains in the kiln from twenty-four to seventy-two hours, depending upon the thickness.

Favor Electric Drive

A little over a year ago a change was made from steam to electric drive. The group type of drive was adopted and eight motors totalling 280 h.p., were connected up. Since then they have had ample time to give this form of power a thorough try-out, and today they are sold to the idea of the electric drive for furniture factories. Not only does their power cost less, but they have found it convenient and reliable. Using electric power, it has been found that the factory refuse is sufficient to maintain steam in one boiler to take care of the dry kilns, glue heaters and in winter the heating of the factory. The steam plant is maintained in running order, so that should the electric power be turned off for any reason, or a break occur in the transmission lines, it would only be a short while before the steam engine would take up the load. Happily as yet such an emergency has not arisen.

The question of fire protection has not been overlooked. Not only is the factory completely equipped with automatic sprinklers, but fire buckets and various forms of extinguishers have been placed at strategic points throughout the plant. Fire hydrants and hose have also been located where they will be found convenient in case of need. As a final precaution a fire brigade has been organized from among the employees, and thoroughly drilled in its duties. Sometimes an alarm is sounded and it is not many seconds before a stream is playing on any part indicated.

Retaining Good Will of Employees

The company has always had the interests of their employees at heart. Every effort has been made to make their work pleasant and desirable. In addition, a watchful eye is kept on home affairs. In the case of sickness or trouble, help is forthcoming in a quiet,

NOTE

Any job, having the above Order Number is to receive preference over all other work and must be rushed to destination without the least delay.

Special rush form, printed on red stock, used to hurry along an order or part

unobtrusive way that cannot help but commend those responsible to the heart of the recipient. A short while ago a comfortable, attractively furnished club and lunch room was completed and given over to the men. This is fully equipped with hot and cold water and heating appliances to take care of the lunches. The management also supplied a phonograph and a good assortment of records for noon-hour entertainment. The room itself is fireproof, having gypsum board partitions and a painted concrete floor. A supply of magazines, including the "Canadian Woodworker," daily papers and other reading matter, is provided.

The clubroom is situated about midway from the main portion of the city and outlaying districts, and is always open to the employees and their families to use for a rest room, should they so desire, when visiting or shopping down town. Needless to say, it is very much appreciated by the men, who are showing a fine spirit in assisting and helping to keep it clean and orderly. This is all the management requests, and should an employee persist in disobeying this rule he will be barred from using the room.

One of the newest developments is an attractive display room for the convenience of visiting buyers. This is finished in ivory and old gold, with decorations to match. Here is found, displayed to advantage, the complete line of the North American Furniture Co., consisting of medium and high-grade dining room, living room and bed room furniture in walnut, oak and birch, the better being finished in that attractive shade known as "Chrome Walnut." A sister organization, the Owen Sound Chair Co., Limited, is also making use of this display room to show their line of medium and high-grade chairs.

The Owen Sound Chair Co.

This latter firm was organized in 1912, with the same officials and directorate as the North American Furniture Co., but is conducted as a separate and distinct organization. The chair factory, while separated from the furniture factory by a lane or driveway, is practically a continuation of the latter building, being four storeys, 250 x 60 feet. The two factories are separate in every way, each having its own power plant, dry kilns, etc.

The equipment, which is up-to-date in every respect, consists of the usual run of chair factory machinery, and includes lathes of various kinds, shapers, band saws, special boring machines and an array of special sanders. The bending department, which is in a new building a little distance from the main factory, is equipped with a number of bending machines, two steaming retorts and a drying room, in which the bent stock is placed to set and dry. With the exception of veneered stock, all chair back and bent rims for Windsor and other chairs are handled here. Latterly they have adopted the plan of bending the back posts of certain of their chairs, instead of cutting them out on the band saw. The saving in material is obvious and a better post is the result.

Have Well Balanced Line

The product consists of numerous medium and high-grade chairs in both wood and upholstered seats. Also a line of Windsor chairs which is particularly attractive and naturally is in strong demand. A number of designs in substantial office chairs complete the list.

The same policies are followed in both organizations. At the present time this company is completing a rest room for its employees similar to the one in the furniture plant. The production of chairs is in charge of F. W. Harris.

The personnel of these two organizations is as follows:— North American Furniture Co., Limited; H. B. Smith, president; D. E. Macintyre, vice-president; J. A. Minchner, manager and of the Owen Sound Chair Co., Limited; H. B. Smith President; D. E. Macintyre, vice-president and F. W. Harris, factory manager.

Can You Make Your Sticker Earn More?

One of Most Important Production Machines in Plant—Handles Large Variety of Work—Tendency Toward Faster Feeds and Quicker Set-ups—Hopper Feed for Handling Short Stock

BY J. C. WILLIS

The superintendent of a furniture factory recently remarked that he was convinced that fully 75% of the work in his plant went through the sticker in some form or other. In a straight front dresser having a square frame, for example, practically all the items are machined on the sticker with the exception of the case top, gable and back panels and the drawer bottom. This only goes to show the importance of this machine for furniture work and the necessity for having a sticker which will carry a fair rate of feed and for having special heads and knives to cut down the time lost in changing from one run to another.

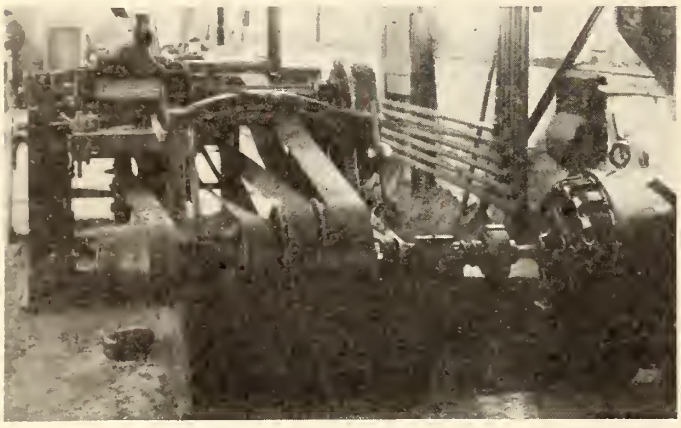
There are so many phases of sticker work in the production of furniture that it would require a lot of space to discuss them all. It is used for all manner of four-sided surfacing, plain or patterned tongued and grooved, rabbeted or bevelled, etc., from the smallest sizes up to practically the full capacity of the machine. Some plants make it a fixed rule to run all stock under 6 inches in width through the sticker, detailing it as required. A few points, which should be considered, are uniformity of size and contour of finished material and quality of finish at satisfactory rates of feed. Practical efficiency is what is required in production departments of a furniture factory, and the modern moulder is standing by its reputation and proving its efficiency in continuous daily operation.

What Feed Should Be Carried?

In a key machine of this type, the question of feed is important, perhaps not so important as in a moulding or flooring plant where long runs on one pattern are the rule and where rates of feed from 50 to 250 feet per minute are found; yet in its affect upon production and costs, the rate of feed is a factor which deserves special consideration. Where some of the older stickers handle the work at feeds of from 10 to 20 feet per minute, the newer machines give a good finish at feeds varying from 50 to 100 feet. For short runs such high feeds may not seem either

desirable or advantageous, but even on the shortest run, an increase in rate of feed means lowered cost and increased output. As much of the material in the furniture factory is handled in short lengths, feeds varying from 20 to 35 feet per minute are about all that could be carried.

It might be of intesest to call attention to the differences which exist between the earlier types of stickers and the modern machine. In the former type the lightness of frame and working parts, including the cylinders, journals, yokes, etc., resulted in vibrations which affected the finish of the stock and which precluded the use of any but the very slowest feeds. This has changed. To-day the heavy upper works are mounted on a solid base, sometimes a one-piece base. The journals are extra large and long and are mounted in heavy, well-lubricated bearings so that vibration is reduced to a mimimum, if not eliminated, and the quality of the work improved. All fast re-



Sticker being driven by direct connected motor

volving parts are perfectly balanced and the feed works actuated by a powerful drive which gives a positive feed. Guides and hold-downs keep the work in alignment in the machine and prevent chattering. All cutting parts are made read ly accessible by removable hoods or drop tables. Another noteworthy feature of recent development is tilting side-legs which allow the use of ordinary jointing heads for running bevelled matched stock. This feature makes the modern moulder particularly useful for bevelling stock for such items as pedestals for extension and parlor tables.

Saving Time in Making Changes

On account of the many different kinds of work the sticker is called upon to handle, there is probably no machine in the plant on which more time can be wasted in changing from one set-up to another. Where the operator is called upon to grind and work out his own patterns from thick knives, the setting-up time is often out of all proportion to the actual work to be run. Time is a factor which must be reduced and conserved in order to keep down production costs. The equipment, construction and operation of a modern moulder all tend for lowered costs, increased production and quality finish. Contrast the plant in which the sticker operator must make a set-up for every change in pattern, with one which has forty-eight special set-up heads. In the latter plant all the operator does is to take a slip-on head, which has been fitted in the grinding room, put it on the pull-out spindle and make the necessary adjustments of guides, hold-downs, etc. A set-up of this kind takes very little time in comparison to one in which the operator must bolt the knives on the head and make various adjustments before he secures the dimensions and details required. With the slip-on type of head, the operator is certain that the cutters are in balance and that good work will be produced. Again, while the machine is running on one pattern, other slip-on heads can be fitted up and held in readiness for the next run. It will be seen, therefore, that the time required to set up can be cut down to a small item.

Milled Bits and Hopper Feed

In considering milled-to-pattern bits, it is well to bear in mind that the bit can be used almost its entire length because of special devices for holding them in the head and patterns run to-day will match those run a year from now or a year before, as the milled bit always remains the same, something which is impossible with the old style ground knife. Faster feeds are made possible by the use of milled bits furnished four or six to a head. They are clamped in seats provided in the head and as nearly as possible to an even tracking. The bevelled ends are then ground equally and in some cases jointed in the grinding room after which the head is ready for use. In other cases the head is put on the mach ne and clamped in position in its relation to the guide, the jointer is attached and a stone, shaped approximately to the contour of the cutting edge of the knife is inserted. The head is turned slowly by hand and the jointer stone cut exactly to the shape of the knife. Then the machine is run at full speed and the stone adjusted to the head until the knives just touch. Then the jointer is removed and the machine is ready for operation. With this method all knives are brought to the same cutting circle and, therefore, cut equally, giving a better finish at higher feed than with one or two knives making uneven cuts at each revolution.

An attachment which has been used to quite a large extent on boxboard resaws and which has been adopted to stickers, is the hopper feed table, whereby a continuous stream of stock is kept going through, increasing the output of the machine. The operator sees that the hopper is kept full with material. He does not have to over-work himself to do this as he can handle a number of pieces at one time and is not required to move as fast as if no hopper has been provided. Stock formerly run in long lengths can be dimensioned in the saw room, leaving all waste and cull pieces there and then only the useable material run through the sticker. Such stock as table legs, chair legs, table aprons, drawer fronts, and sides, door stiles and cross rails, phonograph cabinet mouldings and work of a similar nature can be handled to advantage on an up-to-date sticker.

Driving Screws on Quantity Basis

Special screw-driving equipment is proving its usefulness in many plants. With Some of the types of screw-driving machines on the market such as the Reynolds, the screws are dumped in a hopper from which they are carried down to the driving bit and are there ready for instant use. Where a lot of screws are to be driven, a machine of this kind would seem to be desirable as it can do the work of six to eight men driving by hand. This is one machine that might be used advantageously in many departments in the modern furniture factory.

Production Control in Furniture Factories

Lower Costs and Increased Production Result From Efficient Routing—Items Entering Into Production Control—How all Factors are Handled—Analysing Delays and Wastage—Keener Competition Requires More Efficient Methods

by JAMES J. MARTINDALE*, Detroit Mich.

Every factory has some kind of production control. Therefore, it must be borne in mind that it is quite possible certain of the elements discussed here are already in effect in many shops. Further it is believed that the complete general methods described are possible of application to all woodworking factories. Each shop, however has its own peculiarities and a form which fits a condition in one does not necessarily satisfy similar demands in another shop. Every job of production control development is a special one—special to the plant in question. Furthermore, in introducing new methods the human element must always be reckoned with. The plan of installation must be carefully considered and more carefully carried out. It is a job requiring experience in the handling of similar cases.

Woodworking factories of today lack many of the essential elements of a control of production. A weak control causes some of the following results:— 1.Use of verbal orders; 2. Spasmodic production; 3. Too frequent and in many cases unnecessary switching of production crews; 4. High unit costs; 5. Delayed shipments; 6. Dissatisfied customers.

Elements of Production Control

A production control to remedy the above evils, must have the following qualifications:— 1. Simplicity Requiring but few clerks and a minimum of system or red tape. 2. Elasticity: To satisfy demand for increased production, and when necessary, quick changes in planning. 3. Accuracy: Must be built up on reliable information and turn out the product in specified time, quantity and quality. 4. Allow of minimum output costs: (a) Eliminate majority of material follow-ups on the part of the foremen and unnecessary foreman conferences. (b) Permit as "long runs" as possible. (c) Permit and encourage most economical use of labor. (d) Encourage improved methods. (e) Increase production per employee. (f) Shorten time of production.

The essential elements of a production control are developed as follows:—These elements are shown in that sequence in which they might be installed in the average plant. A discussion presents the main characteristics of each element or set of elements under their respective headings: Material Control; (a) Requisitions; (b) Perpetual inventory on: Raw material, Expense material, Finished parts, Complete output; (c) Control of material in process.

Necessity of Following Work

It hardly seems necessary to point out the advantages of the control of material in its various stages, yet unfortunate to relate, a number of shops have been served where a lack of such control existed. A planning system to be successful must have a control of material. Without such control, the production may be likened to that of a boiler plant suffering from intermittant coal handling. Steam, output of the boilers, is most irregular as is shown by the graphic recording gauge. If such a simple device could be used to record the output of the average woodworking shop, the woodworking industry would be in a much better producing stage than it is at present.

The issuance of instructions effective on a certain date, that no material is to be dispensed without a properly signed requisition, puts a stop to unnecessary visits to the stock rooms, reduces stock demands and soon installs the requisition writing habit. Figure 1 illustrates a convenient stock record sheet (size 8½ x 11).

A finished parts stock room can be maintained with considerable advantage in many furniture shops. Its use relieves the production floors of many loaded trucks and insures delivery of the part when required for assembly.

A traveller or card to accompany material (for control of material in progress) serves the purpose of identification, furnishes a continuing count and can be used to show the stages of processing. Such a form is shown in Fig. 2. A traveller should be of comparatively large size (5 x 8 is rather a well dimensioned form) to prevent its being lost. It also should be colored for easy recognition. Frequently where the card is liable to be soiled in handling, it is advisable to place it in a manila envelope for protection. In many planning departments the operations could be placed on the traveller in sequence before sending the traveller to the department. If such a procedure is inadvisable, this information can be placed on the card by the departmental clerk or foreman before it is given out.

Proper Sequence of Operation

The placing of the operations in their correct sequence on the traveller reduces the possibility of wrong processing. On some other parts it is absolutely necessary that, say operation 2 be performed before operation 3, because if the reverse sequence takes place the part would have to be scrapped. When the finished date is placed opposite an operation together with the number finished, the completion of the operation is indicated. The truck load of material is then ready to be moved to the next operation.. The proper design and use of a traveller can only be specified after a careful analysis of the plant operating conditions.

Operation Sheets: Operation sheets when filled out with required information become the Bible of production. They should be bound in a loose-leaf manner and carefully filed for ready reference. The paper should be of good quality to withstand the continual reference and turning of leaves. A form of operation sheet is illustrated in Fig. 3. In many cases this sheet should be of lettered size (8½ x 11) in order to permit of convenient filing and the recording of necessary information.

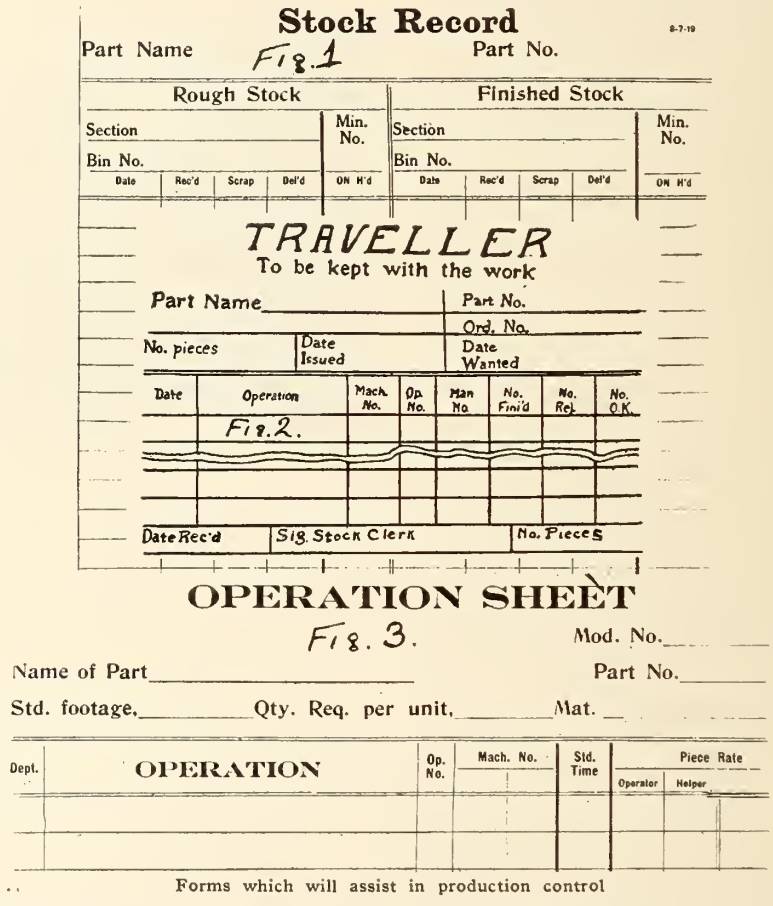
The development of operation sheets requires the

*Vice-president James E. Morrison Co., Industrial Engineers.

noting of all operations in sequence. This further entails a development of standard nomenclature for the various operations. This in itself is quite a valuable addition to shop control as it is frequently found the same operation will be indicated by the use of two or three or even four different names—thus causing unnecessary confusion. The operation sheet should have spaces for standard times and piece rates (or premium rates) and then becomes the official file for standard times and the incentive rates.

Bill of Material or Cutting Bill

Bills of material: A bill of material furnishes complete information as to the parts entering into the make-up of an article. A sample is shown in Figure 4. It should specify the kind of wood, number of pieces per each unit, finish and rough sizes. When issuing orders to the shop, such a bill of material should accompany the order for ready reference by foremen interested. For such a purpose it is well to have the bill of material sheets prepared by type-writer or draftsman in order to permit the obtaining of blueprints for issuance. In time the foremen will have received blue-prints of bills of material covering all articles manufactured. These should be kept in a loose-leaf file supplied to the foremen for the purpose. Any corrections to be made on these bills of material should be made by some person, designated by the production or superintendent's office, on all sheets affected and date and initials of party making alteration noted after change. This form can well be in letterhead size (8½ x 11) for greater convenience.



Forms which will assist in production control

General Office Orders: General office orders give the plant authority for the manufacture of a certain number of different units such as 100 dozen of model 30-A chairs or 200 model X phonograph cabinets. They are issued by the general manager to the superintendent and production department. It is essential that the shop should be loaded sufficiently far ahead with work contained on general office orders in order that plans can be made to carry forward production most economically.

Purpose of Shop Orders

Shop Orders: Shop orders are based upon general office orders and give the detail to the shop as to the number and name of parts to be made to fill the requirements of the general office order. They are issued by the production department under direction of the superintendent to the foremen of all departments affected. The stock of parts in finished parts stock room should always be considered by the production department before issuing shop orders.

In many wood-working shops it will be found advisable to issue the shop orders as a Part Order Progress Record rather than one order or sheet covering many parts. It is called a Part Order Progress Record because it fills both the function of a Part Order and a Progress Record of the processing of the part. Such a sheet will give authority to the foremen of departments affected for the manufacture of a certain number of pieces of one part only. This means that if there are 25 parts required to fill the demands of the general office order for a particular article, there will be issued 25 Part Order Progress Record sheets.

The clerk or foreman should carry forward a record of the progress of the parts by noting on the order the date and quantity finished under each operation. This information is obtained from the job tickets. When the part order is completed the sheet should be so marked by the foreman in charge and forewarded to the main office for filing. A sample form is shown under Figure 5. It can also be used in the same manner as authority to the assembly department to assembly the number of units called for by the General Office Orders.

Another type of order frequently called plant, alteration or repair orders have to do with plant or machine repairs or machine installation. They carry a different series of numbers than the General Office and Shop Orders and should be distinctively colored or marked to quickly distinguish them from productive orders.

Accurate Recording of Time

Job Tickets: In obtaining a control of labor and labor costs, it is most advisable that a labor work ticket be issued to a workman for each job upon which he is engaged instead of one work ticket for the whole day's work of each employee. Such procedure enables the cost department to quickly file the various job tickets to their respective employee numbers and later to the order number. This permits the obtaining of quick costs with a minimum of labor or transcribing of information.

Of course there are exceptions to this rule as where a man has many dissimilar jobs during a day—perhaps 10—15. In this case he should be given only

one daily productive job ticket and distribution of his time to the jobs can be forgotten as more money would be lost in an endeavor to obtain such distribution than would be gained.

A sample form of job ticket which has been used in the woodworking industry is shown in Figure 6. A job ticket should be of sufficient size to enable the clerk to so incorporate his information that it is perfectly readable by all parties through whom the ticket passes after leaving the workroom. It should be in duplicate, the duplicate being of different color than the original.

Non- productive job tickets are necessary. These should be of a color different from the production tickets, probably red. They should be issued whereever an employee is a non-productive worker, or wherever a productive worker is temporarily engaged on non-productive work, or is held up in producing by delay of material or broken-down machinery. A comparative compilation of non-productive hours, period by period, is of considerable value in controlling costs.

Development of Standard Times

This work is most important and is something which is going on continually in all up-to-date plants. There is one best way of doing any operation. It is advisable to determine this way and then have the operator perform the work in this manner. The use of jigs, fixtures, and special machines can frequently greatly increase output. If by the use of such appliances the rate of production can be raised, naturally it would be foolish to set a standard time on the operation until the improvement has been accomplished. In this regard care must be exercised to not spend more money than the savings warrant.

However, it will be discovered that many operations are being performed in a proper manner. These should be immediately covered by standard times and recorded on the operation sheets mentioned. The use and advantages of standard times have been rather fully explained in previous articles published by the Canadian Woodworker in the August, September, October and November issues of 1920. Therefore, it does not appear advisable to enter into a lengthy discussion on this subject in this article.

Standard Hours of Work Ahead

The development of standard hours of work ahead is accomplished by taking the orders which are in front of any activity and translating them to standard hours by the use of standard times. This information is most valuable as it enables the planning department to obtain a true knowledge of the work ahead of each machine, group of machines, or departments, and to anticipate any "neck in the bottle" congestion. It is probable that certain machines or departments will be found to have too much work ahead of them to be accomplished in the required working time. To turn out the orders in the specified period requires overtime on the part of the departments affected, the introduction of other methods, or new machinery.

The development of standard hours of accomplishment is obtained by translating work done into standard hours by the use of standard time. The information on the job tickets is used for this purpose. For instance, if 1200 pieces on a certain operation were manufactured in a day and the standard time is .7 hours per 100. then the standard hour accomplishment in this case is 8.4 hours This standard hour accomplishment added to similar standard hour accomplishments of the other producing units in a department, will furnish a complete standard hour output figure for that department for the day. The standard hour measure of result is the only true comparable method.

Accurate records are a vital necessity in modern plant

Development of Efficiency

The development of efficiency of man, group, department or plant is necessary in order to determine production possibilities of these various activities. This is naturally obtained by the relation of the standard hours of accomplishment to the actual hours used in obtaining such standard hours. If a department is operated at sevent five per cent. efficiency and the standard hours represented by new work is 15,000, then the actual hours of work ahead of the department is 20,000. With a department pay-roll of 50, the time required to complete this output would be approximately eight weeks. With this information the planning department is thus able to determine the production program.

This determination further shows up the possibilities in increasing the worker's efficiency. In the case assumed, if the efficiency was increased from 75% to 90%, the reduction in actual hours of work ahead would be approximately 3,000. Using the same payroll of 50 people, this gain in efficiency repre-

sents a reduction in time of the orders in process of approximately 1.2 weeks.

Assembly Progress Record

In the methods thus far outlined, it appears advisable to carry in the production or superintendent's office only the assembly progress records. This record will be maintained from information taken off the assembly crew job tickets or final inspector's daily report as to completed output. Such a progress record will answer the great majority of questions as to the progress of orders. If any further detail is required, it would only be necessary to make a visit to the various departments and in a short time ascertain the conditions, from the Part Order Progress Record sheets, of parts manufactured.

In large shops it might be advisable to consider the installation of graphic control board where the progress of the orders through the shop are shown by various colored markers. Considerable expense can be devoted to progress records and management of the average woodworking shop should be careful as to the extremes to which this may be carried.

Analysing Delay and Wastage

Many managers fail to realize the enormous losses occurring every year in avoidable delays to production. This loss is difficult to ascertain and visualize unless methods are in vogue which allow them to be first obtained and then summarized. Job tickets, as previously described used under strict adherence to rules will furnish the vital facts.

All delays should be listed and divided into two sets. One will have a reason for their happening and the other set will be in the nature of excuses only. The second kind of delays are not allowable. A fair reasonable figure should be determined for the first kind and expressed as a percentage of the available hours of the plant and department. When this percentage has been agreed upon, plant management should be continuously urged to equal and better it. It is a standard of accomplishment.

In all woodworking plants there is considerable waste which is unnecessary. It is advisable to determine both the average necessary waste and the unnecessary waste, and key the organization up to the endeavor to eliminate all unnecessary waste.

A standard percentage of waste for various kinds of output is a figure which can be obtained upon analysis. A reduction of unnecessary waste in woodworking shops to a minimum, is much more necessary today due to the high prices of labor and material. Furtherfore it is an economic crime to waste such a valuable resource as lumber. It should be the duty of the woodworking industry to establish minimum waste percentages and hold out strong inducements to their executives to reach this figure.

Incentives for Foremen and Workers

The incentive for foremen can frequently be based on the accomplishment of the workers directly under their charge, and the reduction of delays and unnecessary waste to a minimum. Incentive for workmen is based upon their efficiency. An incentive, if properly applied, will bring out all the latent possibilities in employees. Lasting and beneficial results can be obtained from its use. Such a subject is an article in itself and cannot be discussed in the space permitted here.

Inspection of the accuracy of jigs and fixtures should be made, perhaps once every month. A certain amount of floor inspection is advisable. Such inspection keeps the employees on their mettle as to workmanship and saves many a dollar in scrapped output. Final inspection of the article before it leaves the assembly department for the finishing department is necessary.

All inspection should be governed by certain specifications and understanding as to quality. A daily final inspection report should be made to the superintendent's office. This question is very important. Before making any drive for production or lower costs, inspection methods must be carefully considered and developed.

The finishing departments (varnishing, upholstering, etc.,) of a furniture factory have their own peculiarities. Although all the principles here outlined are applicable, yet the use in such departments of one or two of the forms illustrated may not be advisable.

Does not Require Large Staff

It might appear to handle such plans as outlined above, a considerable force would be required. This conclusion is erroneous. Considering the average Canadian furniture factory, once the various elements of control are established it would only be necessary to have in the superintendent's office one assistant. The man should be production clerk and time study man and exercise detailed supervision of the production control. He might require a clerk (depending upon general plant and main office conditions) to assist in handling the Part Order Progress sheets, Operation Sheets, Bills of Material, Job Tickets compilation and efficiency information. A stock clerk is necessary. His time is, however, seldom fully occupied with stock duties. He therefore, can be called upon for considerable assistance every day.

Necessity for clerks in the plant departments is dependent upon the type of foremen and number of employees. When the outlined production methods are in operation the foreman finds himself much relieved from previous duties and can devote some of his time to certain clerical duties of the new methods.

In general however, it is bad practice to ask a foreman to perform clercial operations and unless the force of employees under his charge is rather small, a clerk should be supplied for that purpose. Frequently two or even three small adjacent departments can be handled by one clerk with the help of the foremen in emergencies.

Competition and the consumers' demand for low prices will force many a manufacturer to better methods whether he likes the thought or not. The wide awake executive will put his house in order before conditions compel him. It can be stated without reservation the methods outlined if properly installed and fostered, will return large dividends..

Small leaks sink great ships—neglect of detail will entangle and swamp the largest business.

To have a very fine finish on your cabinet work use O O paper or cloth. The abrasive is so fine that it will leave the wood with a good polished surface.

Woodworkers Get Together on Costs

Prices on Special Millwork Should be Based on Accurate Tests—Applying Fixed Burden Charges on Definite Units—Should Estimator or Manager Make Prices?

A representative gathering of woodworkers met recently in Toronto to discuss millwork costs and correct burden application. This meeting was called by E. R. Eaton & Sons, Orillia, Ont., Canadian director of the Millwork Cost Bureau, in an endeavor to arouse a greater interest in this important subject. W. B. Flint, Chicago, secretary of the bureau, was present and gave an interesting and instructive outline of cost work in this field.

He first traced the growth of the Millwork Cost Bureau, which is a co-operative association of sash, door and millwork manufacturers organized to promote cost knowledge. The idea originated eight years ago when twelve millwork manufacturers in the Middle States got together and engaged cost accountants to make a detailed study of cost work in each plant and to devise some efficient uniform system which would be applicable, with slight modifications, to all plants. Other woodworkers wanting to come in on these cost studies, the scheme was enlarged and the Millwork Cost Information Bureau, now known as the Millwork Cost Bureau, formed. Since then the membership has grown until it now embraces 500 woodworkers in the United States and Canada.

How Cost Figures are Compiled

The cost data issued by this organization is the composite average costs based on figures submitted by the 500 members. Cost exhibits, covering various classes of special millwork, are sent in by members. These are assembled, analyzed, the times studied and an average composite figure issued. Mr. Flint claimed that these composite costs were more representative than actual cost studies made in any one plant, and as such provided a better foundation on which to base prices.

The reason for this is that the cost of any job will be found to vary almost from day to day in each plant. One week the men will take so much time to do a certain piece of work. The next week they might do it in half the time or might take longer. Estimates based on such varying cost factors are of doubtful value, while estimates and prices based on the average costs taken from 500 plants are applied on a known standard.

Fixed Overhead Charges

There are many ways of applying overhead. Some add a percentage on lumber; others on labor, while still others on labor, plus material. Percentage is not the most equitable or the most accurate way to apply overhead. A machine may be operated by a 60 cent man one day and a 40 cent man the next. The actual overhead is the same in each case but the burden charge will vary if it is applied as a percentage on the per-man hour rate. It costs practically as much to handle 1000 feet of oak as the same quantity of hemlock, yet if the overhead is applied as a percentage on value, the charge will be nearly three times as much in one case as in the other.

A better way is to divide the overhead and apply it as a fixed charge on a definite unit. On lumber add a fixed charge per M feet to the f.o.b. price. If the material goes through the kiln, add a fixed kiln-drying charge per M. This gives the lumber cost at the factory door. In the plant add a fixed burden charge, not percent, per man hour. This charge will vary for machine and cabinet men. Then for commercial burden add a percentage on the factory cost which really amounts to a fixed charge per dollar. Thus we have three definite units for applying burden,—unit per M feet, unit per man hour and unit per dollar on factory cost.

Average Burden Factors

It has been found in studying the figures submitted by the members of the Millwork Cost Bureau that the average burdens are $5.30 per M for yard burden, $6.00 per M, kiln burden, 57 cents per hour machine burden and 34 cents an hour, bench burden, while the commercial burden averages 20 per cent on factory cost. The average wage paid is 60 cents per hour for machine labor and 66 cents per hour for bench labor, average set-up for sticker work, $1.32 net.

Mr. Flint emphasized the value of basing higher prices and estimates on standard lists. A woodworker hires an estimator and hopes against hope that he has secured a man with almost supernatural knowledge so that he is able to estimate, or guess, not too high so as not to lose business, neither too low so that money will be lost on the order. It is out of the question to expect one man to be able to keep in close touch with labor and material fluctuations on all classes of work. The better way is to have certain standard lists and for the manager to fix the price by instructing the estimator to add or subtract a certain percentage from the prices shown. These lists would be based on a definite cost factor. By figuring costs and then adding a profit, competition may be met in an intelligent manner, as, if the business is considered desirable, the amount a person may cut before reaching the cost line, is definitely known.

Who Takes the Chances?

Why should a woodworker hire an estimator and then gamble by backing him with his profits and even with his capital? It appears to be far more logical to establish certain known costs and then base the selling price on these figures and tell the estimator that these are the prices at which he must figure the material or the items in the various jobs. In this way the person with the most at stake is fixing the prices, not the estimator who has little or nothing to lose.

The estimating course which is conducted in connection with the work of the Bureau, was described by Mr. Flint. This is a service to members, who may enrol any number of their employees. The work consists of a study of plans, the taking off of quantities and the application and use of Cost Book A and the universal price list. The student is given in addition a thorough training in the taking-off of material, in drawing up specifications and in making out estimates. Cost Book A is in reality a basic cost list for special millwork details.

In the general discussion which followed Mr. Flint's talk, the comparative cost estimates which have been appearing in recent issues of the "Canad-

ian Woodworker," were used to show the lack of uniformity which exists as to the ideas of cost and to the necessity forr woodworkers giving greater attention to this end of their business. All present displayed a lively interest in the work of the Bureau and in the points outlined by Mr. Flint, and a number intimated their intention of becoming members.

The following is a list of those in attendance:—
W. P. Flint, Millwork Cost Bureau, Chicago, Ill.
W. A. Hadley, S. Hadley Lumber Co., Ltd., Chatham, Ontario.
Chas. S. Dunnett, Walter Piggott Lumber Co., Ltd., Windsor, Ontario.
James Walt, Robert Stewart Co., Ltd., Guelph, Ont.
Chas. S. Anglin, Chas. S. Anglin & Co., Kingston, Ont.
Wm. Pillar, Chas. S. Anglin & Co., Kingston, Ont.
J. H. Eaton, J. R. Eaton & Sons, Limited, Orillia, Ont.
E. R. Eaton, J. R. Eaton & Sons, Limited, Orillia, Ont.
A. L. Bennett, P. W. Gardiner & Sons, Galt, Ont.
M. J. Bray, Midland Wood Products, Ltd., Midland, Ontario.
John H. Cole, Knight Bros., Burk's Falls, Ont.
F. Hutcheson, Muskoka Wood Mfg. Co., Huntsville, Ontario.
Jaffray Smith, John B. Smith & Sons, Ltd., Toronto.
Frank A. Kent, Seaman, Kent Co., Limited, Toronto.
E. C. Woods, Kingston Road Lumber Co., Toronto.
H. W. Hope, Hope Mfg. Co., Toronto.
Alex. Rhind, Simpson Planing Mill Co., Toronto.
H. M. Duthie, Simpson Planing Mill Co., Toronto.
W. W. Abra, John C. Gilchrist Lumber Co., Toronto.

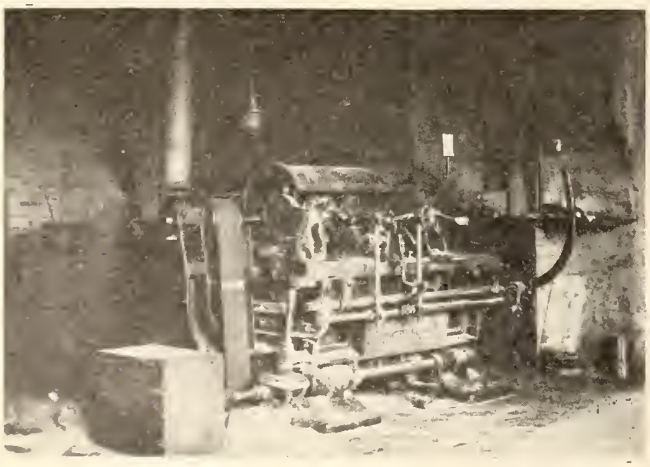
Development of Turning and Shaping Lathes

Specially Adapted For Quantity Production of Turnings—Replacing Band Saw and Shaper on Square and Octagon Work—Intricate Designs Handled to Advantage in Quantities—Leg-forming Machine for Cabriole Shaping

By L. D. TAYLOR

Is it correct to say that the demand for certain styles of furniture has been responsible for the development of special equipment or has the special equipment made possible the manufacture of certain designs, which afterward have been popularized? Regardless of what your answer may be, special equipment has been responsible for the production of certain attractive period lines in quantities which brought the price down within reach of the average person. This is particularly true of the automatic turning lathe and the automatic shaping and forming lathe.



Automatic turning lath. 'n plant of Malcolm & Hill, Kitchener, Ont.

The popularity of styles calling for special turnings, including squares, hexagons, octagons and ovals, as well as rounds, has forced many furniture manufacturers to consider the problem of the quantity production of these items. The methods in vogue in many plants, such as hand-turning and special shaper, band saw and buzz planer operations, were found to be too slow, too inaccurate and too costly. For these reasons the automatic turning lathe with its high productiveness, its accuracy in quantity reproduction and because of its ability to handle the most intricate designs, has met with a ready demand.

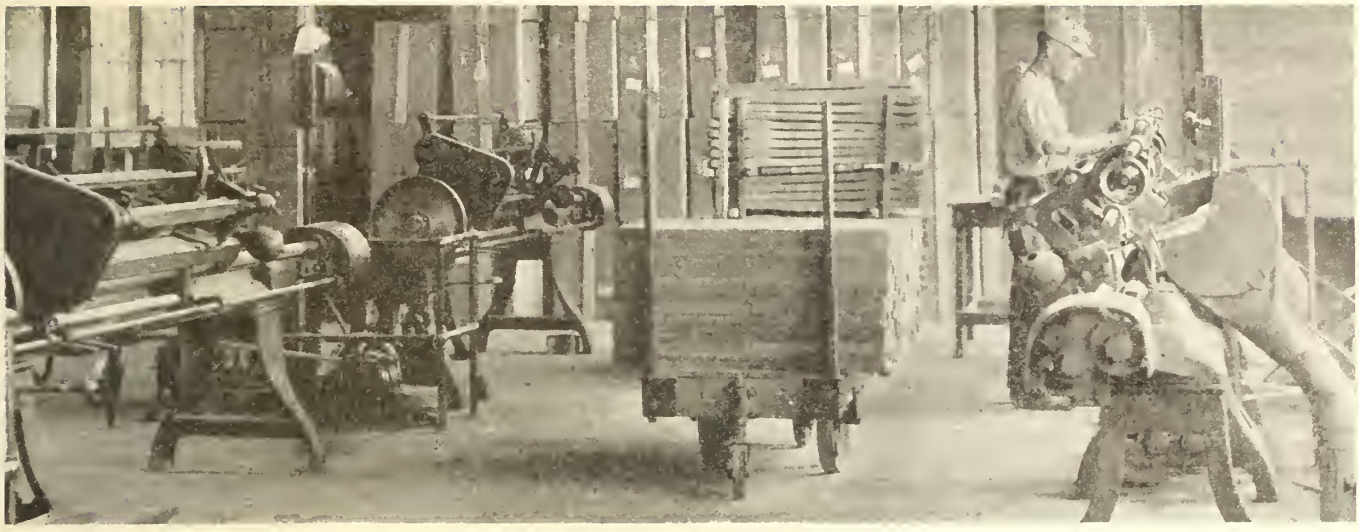
Capable of High Production

In the hands of a capable operator, the automatic turning lathe can handle a wide variety of work to good advantage. With such a machine one man will produce from five to ten times as many round turnings per day as a skilled hand turner. On other classes of work he will turn out from ten to twenty times the number of squares or octagons obtainable from the band saw or shaper. This means a saving in labor, a lowered overhead per piece as well as increased production.

To one not familiar with the automatic turning lathe, a brief description of the principles involved might be of interest. Briefly, the machine consists of a pair of centres and a special cutter head. The centres are mounted so that the work may be moved forward to engage the cutters, and for round or oval work, revolve against the rapidly-moving knives. The cutting is done by cutter heads mounted on a large spindle. The heads are slotted and are made in sections so that for a short-cut only a small section is used, while for a longer one more sections would be added. The cutters, which like moulded knives are interchangeable for different designs, are mounted on special cutter blocks which hold them at an angle so as to give a shearing cut.

Shearing Cut Makes Smooth Work

The cut itself is similar to that employed by the hand turner, that is, a shearing one from the high point down. This is obtained by the angle at which the knives are mounted. Suppose a bead is to be cut,



One man attending number of leg-forming machines. Can operate lathe and sand output

two knives are used, one cutting from the centre or high point toward the right, the other one cutting from the high point toward the left. In this way every cut is downward and a shearing one regardless of the intricacy or detail of the design. It is seldom that one knife cuts more than two members. By combining a number of knives to give the required contour, all members are cut at one time. This is how such high productiveness is obtained.

It is usual in many shops to have a number of extra heads which are set up for what might be termed stock designs—turnings which are made over and over again. When this practice is followed, the set-up consists of simply placing the necessary head sections on the cutter heads, spindle and making a few simple adjustments. The operator soon becomes expert in handling and setting up this machine so that setting the knives for even intricate designs does not present any unusual difficulties.

Setting-up Box Saves Time

The setting-up box shown herewith will be found very handy. It is constructed of wood and is easily made. The three blocks carrying the arbor bearings are 1¾ inches thick by 8¾ inches high and 18 inches deep. The box is 47 inches long over all. One of the end blocks is not screwed to the box but is left free to move in and out. A strip is nailed along the back and bottom of the box to keep this end block properly lined up and to add strength to the box itself. The grooves for the bearings should not be cut in the exact centre of the blocks but rather at a point about 8 inches from the back of the box. The two stationary bearings should be placed 7¼ inches between centres.

By using three bearings, two stationary and one removable, you have the same principle in the setting-up box as in the lathe itself. Of course care must be taken to have the arbor tightly clamped in the stationary end bearing to prevent the head from dropping down when the loose bearing at the other end is removed. With a setting-up box of this kind, the knife maker can handle the cutter-heads more conveniently and in less time than with a box having only two stationary end bearings.

Shaping Lathe for Cabriole Legs

Mention was made in the opening paragraph of a special automatic shaper or forming lathe. This is used largely for making cabriole legs for Queen Anne furniture, though it can be put to many other uses. In operation it is very simple, a shear, cutting head taking care of all designs. A master pattern is used for each design. This is copied accurately and in detail, the reproduction being an exact replica of the original; thus all the fine curves and proportions of the master pattern are imparted to the product.

When the equipment is suitably arranged one operator can look after more than one machine or can operate the lathe and sand the finished pieces at the same time. This machine has reduced the quantity production of cabriole legs and similar items to a fine art.

Special box to facilitate set up of cutter heads

Comparative Raw Material Values

In dealing with the prices of raw material in his report covering the work of the Cost Accounting Department, Jas. E. Ferguson gave a few figures which show the rebound in values which has taken place since prices reached their lowest point. These figures also indicate how present prices compare with those of 1915. The figures, which are extremely interesting, are as follows:—

Material	Low	Change from low at Dec. 31	Change from 1913
Lumber	35% Dec	11.8 Inc.	104 Inc.
Glue	24% "	10. "	39.5 "
Hardware	22% "	1.6 "	119 "
Glass	54% "	None	19 "
Mirrors	28% "	25 "	83 "
Finishing	17% "	1.5 "	98 "
Packing	37% "	None	70 "
Upholstering	30% "	6 "	93 "

What to Do if You Want to Sit at the Boss's Desk

An Interview with Wallace B. Donham, Dean of the Graduate School of Business Administration of Harvard University

By BRUCE BARTON*

"Business is full of young men who seem to have ability; who work hard; who believe in their companies and are eager to get on," said Dean Donham. Their industry and faithfulness carry them to a foreman's position or a chief-clerkship. But there they stop. Why? Most often, I believe, it is because they approach every problem from the standpoint of the little part of the business with which they are familiar; not from the viewpoint of the business as a whole, and not from the employer's standpoint. They never imagine themselves behind the boss's mahogany desk, and ask, 'What is he trying to accomplish? What are the problems as he sees them? What would I be trying to do for this business if I had his responsibility?' They do not realize that if you wish to be an executive, you must think like an executive.

Answer These for Yourself:

Am I in a department where money is made?

How can I make more money for my employers?

Can I originate good ideas?

Am I able to think clearly and constructively?

Can I express myself clearly in conversation or in writing?

Am I able to grasp the executive viewpoint?

"You remember the story of the young man who came to see Lorin F. Deland. He complained that he had been with the same company for a number of years and had received only minor promotions. He wanted to enlist Mr. Deland's help in securing a better job. Mr. Deland agreed to solve the problem if the young man would promise to follow his orders exactly for a period of thirty days.

"'The company which employs you does a gross business of many million dollars a year,' Mr. Deland said to him. 'For the next thirty days I want you to give your entire thought to the question how you can increase its business by $50,000, or by $5,000, or even by $1,000.'

"At the end of thirty days the young man returned, rather crestfallen, to report that he had not been able to think of any way by which the company could increase its business at all.

"'Very well,' said Mr. Deland; 'let us take the thing from another angle. During the next thirty days find out some way in which the company can decrease its expenses by $10,000, or $1,000, or $500. A decrease of even a small amount in costs is equivalent to a very much larger increase in gross volume. Go to it now and find some way to save.'

"Again the young man went away; and again he returned to announce that in the whole thirty-day period he had been unable to conceive a single constructive suggestion. At this second admission of failure Mr. Deland threw up his hands.

"'Think what a tragic confession you have made!' he exclaimed. 'Here you are, in the very heart of a great organization doing business all over the country. The market for its goods is growing tremendously; other men are finding ways to add millions to its gross business. Yet you are unable, in a whole month, to discover any way to add a single dollar! It employs thousands of people, rents great buildings, purchases supplies in huge amounts—all of which implies the certainty of waste. Yet you are unable to suggest any way by which it can reduce expenses at all. Young man, I advise you not to let the general manager see you any more than you can help. For if he ever discovers that he is paying a salary to a man who has so little constructive imagination, he will certainly replace you with someone who can think as well as work.'

"If Mr. Deland had been illustrating the objects for which a school of business should work," Dean Donham went on, "he could hardly have done better. Every year several hundred college graduates come to us at Cambridge to fit themselves for executive positions in business. Many of them expect to be told, or to read in books, how to do business successfully; but our idea is entirely different.

"We start in, practically before anything else is done, by giving them a complicated problem to work out, such as a general executive must face. Such a problem as this, for example, which is taken directly from the recent experience of a well-known business executive, who operates two plants about twenty miles apart. The slump in general business cut his sales fifty per cent. How shall he readjust his operations to meet the difficulties presented by that slump? If he closes one plant, and operates the other full time, he may earn the dividend on both his preferred and common stocks; but he will be reducing his high cost inventory unevenly and entirely disrupting his force at the plant which is closed. By keeping both plants running half time he can handle his inventory more

*In the "American Magazine."

advantageously and hold together a nucleus of his organization in both places; but the expense will be so much higher that he will surely fail to earn his common stock dividend.

"Now, shall he shut down one plant, even though he disrupts his labor situation, because this will give him a better chance to run full time at the other plant and to earn dividends for his stockholders? Or shall he run half time in each factory, increasing his expenses and surely eliminating his common stock dividend, but working off his inventory at each plant, keeping his picked men busy, and holding his organization intact for the return of better times? Entering into the question is the problem whether he can continue to sell even as much as fifty per cent of his possible out- his dividends will have on his credit.
put, as well as the effect his paying, or failing to pay,

Willingness to Shoulder Responsibility

Nearly every department of modern business is involved in this problem—accounting, sales, finances, manufacturing and labor. We let these young college graduates wrestle with it for a couple of days. Then we ask for their solution. What would they do if they were the owners of that business, with the whole responsibility on their shoulders

"While they are still in a rather hopeless muddle we analyze the problem for them in its various aspects, to show the complexity and the interesting nature of the general executive's task. We keep them for two years analyzing all sorts of business problems and making up their minds how they would act if they were on the executive job.

"The other day an officer of a big corporation told me that he was about to be promoted, and that for several months he had been trying to train his successor.

"'I have two assistants,' he said, 'either of whom, I know, could hold down the job; but I cannot get them to think so. I cannot get them to put themselves in my place and really take responsibility. In otherwords, they think always from the bottom up, never from the top down.'

Have You Earned More Money?

"I do not know of any better illustration of the difference between overhead thinking and underneath thinking than the reasons men advance when they go into the front office to ask for a raise," Dean Donham continued. "A man will say: "I have been here so many years, and I think I should be doing better,' or 'My family has increased and I need more to live on,' or, 'You are paying Jones so much more to live on,' or, 'You are paying Jones so much a week more, and I don't see why I am not raised, too.'

"All of this may appeal to the boss's sympathy but not to his business sense. His mind is concerned chiefly with the problem of profits. It has to be so concerned. The reason for a raise, or for a change, that is sure to appeal to him is that this man has done something that makes him more worth while in the business.

"To read some of the articles written about business you would conclude that it is some sort of algebraic problem; that, given a few formulae and rules, anyone can go out and make two dollars grow where only one grew before. A good deal of our business training in the past has been predicated on that idea, ignoring the human factors entirely.

"Rules a man must have, if he is to play the business game successfully. But all the rules in the world will not make him win unless he knows how to use them and can figure out how the other fellow is likely to think and act. What are his motives and his interests? Who are his friends? Where do his profits come from? The search for and discovery of the motives of the other side in a trade or a negotiation is one of the first essentials to success.

"If you were starting in business again, where would you start?" I asked Dean Donham. "Does it make any difference where a man begins?"

"It makes a lot of difference," he replied positively. "There are some departments that seldom lead anywhere; and there are other departments that make the transition to executive opportunity much easier. Certain jobs seem to lead ahead into executive positions. Perhaps it is because they bring a man into contact with several executives; perhaps the chief is interested in a particular job because it is close to where the money is made; perhaps a certain job gives training in or familiarity with all departments of the business.

"On the other hand many jobs seem to be dead ends. When a young man is in such a job he should study how he may get out into another field. This calls for great skill and care. If tried in the wrong way, the chief is very likely to conclude that the man is a quitter and cannot stand the gaff. His staying powers may be on trial. The corporation is not run for the benefit of a single individual, and there may be no other job available at the moment. Nevertheless, skillfully done, a request for a transfer under such circumstances may become evidence of reasonable ambition and of the kind of quality that the chief is always looking for.

Ability to Analyze Valuable

"Patient, careful study of the business, of the organization, and particularly of the chief, should precede such a request. Before trying for a transfer at all, be sure that the job is a dead end. The man who can see new chances for improvement in a job of routine nature, and who realizes that, broadly speaking, no human process will stand the test of intelligent study without improvement, can make an opportunity out of many a job which is apparently dead and uninteresting. This is, after all, the best basis for obtaining a transfer—or, rather, a promotion—to other work.

"Before you apply for a job, analyze the business and the organization as well as you can from the outside, and make up your mind whether you want to apply to that particular concern or not. If you apply, don't attempt to dictate terms. After you go with a company, study it and yourself to see how you will fit best and what end of the business you want to get into. Plan ahead. Among other things find what end of the business is the one where the money is made, or the one that is most important in that particular industry.

"In most branches of the textile industry, for example, the money in ordinary times is made or lost in the purchasing and in the choice of what shall be made, rather than in the manufacturing. To get raw materials at the right time and at the right price is one of the principal problems; and the man whose judgment and knowledge enables him to know when, how, and how much to buy, and what can be sold, is worth any amount the concern has to pay to keep him. In a machine shop or a concern manufacturing

A Saw for Economy and Production

Straight Edging and Jointing Saw Is Cutting Costs in Many Plants — Increased Output and Saving in Stock Some of the Advantages—Has Wide Range of Usefulness

By G. A. WEBB.

Ripping stock so straight and accurately that the pieces may be glued without further straightening or correcting may seem to some like a stretch of the imagination, yet it is being accomplished day in and day out in many plants in Canada. The machine responsible for this fine work is the straight edging and jointing saw or, as it is sometimes called, the chain feed rip saw. This saw is a development of and an improvement over the older type of power feed rip saw and the chain feed band rip saw. While a comparatively new machine, it has earned a reputation for accuracy and production and is meeting with approval wherever installed.

To one who has never seen a straight-edging saw in operation or has not had an opportunity of testing the accuracy of the cut, a brief outline of the principles involved may be of interest. The saw is made in two shapes, one with the saw arbor mounted beneath the table, as in the ordinary run of saws, and the other with the saw mounted overhead, the work passing between saw and table. In both types of machine, the stock is held securely between a travelling feed chain, in the case of the machine with the saw coming up through the table two travelling feed chains, and a number of overhead feed rolls. The chain or chains are so secured and guided that the line of travel is a straight line one and absolutely parallel with the saw. The rolls and chains are so designed and adjusted that the stock does not swing around or twist as it is fed through. Thus it produces an absolute straight line cut without the use of any gauge or guide. Once started through at any angle, the piece holds that position till the cut is finished. The straight edge thus produced may be used for ripping to width from the gauge.

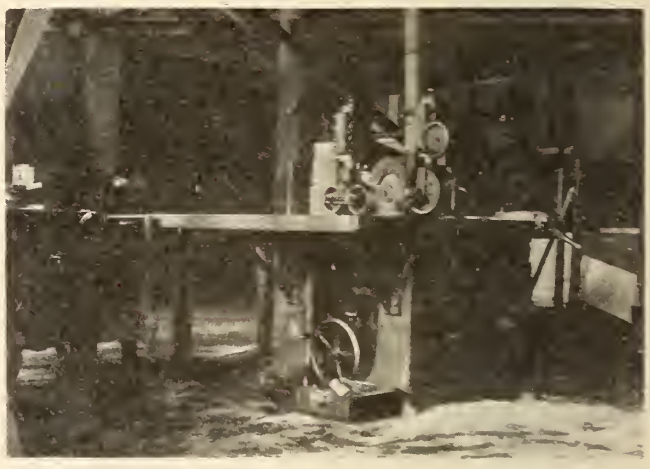
Save Considerable Stock

By properly selecting the cuts, pieces having crooked, tapered or wany edges, and stock containing knots, rotten spots or any defects, may be made to yield a maximum of usable material. The arrangement of chains and rollers is such that short and narrow pieces may be ripped or edged and worked up. Thus the machine can be put to many uses in addition to ordinary ripping and edging.

When first placed on the market it was looked upon as more or less of a special machine. While to a practical man the advantages of straight line ripping were apparent, yet the statement that the stock could be glued without straightening or jointing, was received with a certain amount of scepticism and usually with a mental reservation to the effect that such a saw would only be suitable for the very lightest forms of work. In other words, the possibilities of the machine were not at once recognized. Since then it has won its place as a piece of production equipment and today is found in the breaking-out department of many large plants. The writer has visited several plants which are operating two of these machines in their breaking-out section, and there are at least two Canadian factories which have installed a battery of six or more of these saws. As a rule, a straight edging saw will do as much work as three ordinary hand-feed saws. The saving in labor costs resulting is apparent.

Opinion of Practical Men

It might be of interest to review the opinions of a couple of practical men. The superintendent of a large furniture factory has this to say:—We have two of these modern straight edging and jointing saws and are particularly well pleased with them, as we



Straight-edging and jointing saw in Kitchener furniture factory

get wonderful results. When we first installed these saws, we had six hand rippers and one old type self-feed ripsaw. We put out all these machines and we get the work done just the same with the two straight edging and jointing saws. We also save a great deal in stock, as with the old type of machine we allowed ¼-inch oversize and with the new machine we allow only 1/8-inch oversize. The stock is always straight, and I think I am safe in saying that this machine has paid for itself each year. I certainly would not like to run a woodworking plant without one."

Another man in charge of a piano factory expressed himself as follows:—"It not only takes the place of the two saws formerly used but more work is put through in the day's run. The cuts are so true and accurate that for our heavy core work, the stock is glued just as it leaves the saw. The men in the gluing department claim that a jointer made in this machine is more accurate than one made in the ordinary jointer. For face stock where a fine glue line is required, owing to the accuracy of the cut, it is only necessary to remove a very light shaving on the jointer, effecting a saving in time and stock. Another desirable feature is the safety one, the operator being fully protected.

How Savings are Effected

The saving of stock referred to by the furniture factory superintendent is worthy of more extended mention. It stands to reason that with absolutely straight line cutting there is no need for allowing ½-inch or 3/8-inch for straightening purposes. When this allowance is cut down to 1/8-inch, the saving in

stock may seem to be small, but at a feed of only 60-feet a minute, the saving would amount to 40 or 50 feet a day or about 1200 feet a month, no small item in itself. In the case of core stock, which is usually glued right from the saw, the amount saved would be even greater for the 1/8-inch allowance would be done away with. For a faster rate of feed the amount of stock saved would be greater. Feed speeds as high as 125 feet a minute may be carried.

The usefulness of this machine is not confined to furniture work. It has a place in every plant where accuracy and production are considerations. In one factory 2-inch maple is being ripped at the rate of 75 feet a minute, while in another 4-inch birch has been put through at 50 feet a minute. The straight edging and jointer saw has certain limitations, however, for it is not probable that a straight line cut would be made on a long plank, although if a suitable extension or sub-table were provided, exceptionally good ripping could be accomplished even on long stock. As an all-round machine, it is hard to better and for the accurate ripping and edging of short lengths, 8 feet and under, it is in a class by itself and in addition it is a production machine of no small merit.

Is Your Belt Sanding Up-to-date?

Making Good Furniture at Low Prices Requires Efficient Methods—Belt Sanding Takes Place of Costly Hand-work on Large Variety of Intricate, as well as Ordinary Jobs —Select Type Which Gives Greatest Return in Labor Savings

By HENRY ADDISON*

Sanding by belt in the furniture factory dates back a good many years, but it is only within the recent past that belt sanding has been given serious consideration by practically every factory superintendent. This is due to the fact that economical production in any factory demands that all hand work which can be done easier, better and faster by power, must be eliminated in favor of the machine method. Any factory making furniture, cabinets, interior trim, store fixtures or mill work is not thoroughly up to date, if it lacks a hand-block belt sander.

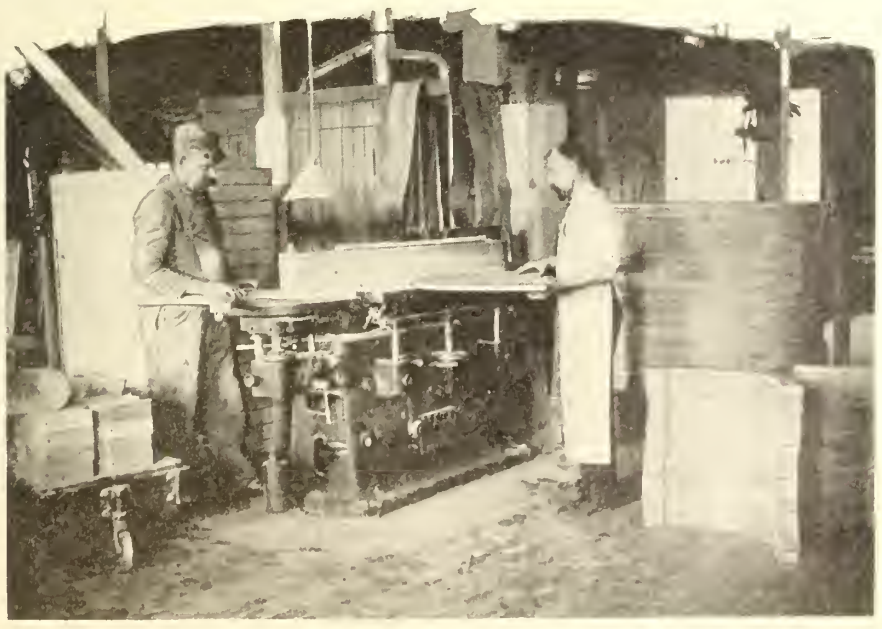
The reason is a simple one. Hand-sanding is expensive, slow, and liable to be slighted. But many firms have never taken the time to check up the number of small jobs, so-called, which are being sanded by hand, either partially or completely, by the cabinet makers. A survey of the mouldings, frames, and other similar jobs which are constantly being hand-sanded, would show conclusively that at least 75% to 90% of that hand work could be eliminated by the installation of a hand-block sander.

*Rockford Machine Works, Rockford, Ill.

Special Forms and Supports

Special purpose machines are a necessity, but as a general thing, they leave more or less touching-up to be done by hand. The adjustable table on the hand-block type of belt sander, and the flexibility of the sandbelt are two very important features. Table construction permits attaching special work-supporting devices for getting at the out-of-the-ordinary shapes such as large doors, round table tops, rods or poles, special moulded shapes, etc. almost without number. Truly the handblock belt sander is the all-around sanding machine. Its range is great enough to enable it to help out the special purpose machines when they are crowded with work, but its greatest advantage lies in its ability to eliminate the costly handwork on the ever-recurring small, odd jobs which every woodworking factory has to contend with.

There are numerous types of belt sanders on the



Performing various sanding operations on edge, belt sander in Canadian furniture plant

market adapted for special classes of sanding, and some of them are capable of producing a finish so perfect in smoothness that to further touch it by hand would spoil it. Take the automatic power stroke stroke sander which also combines hand-controlled contact—many concerns can afford to throw away old-style sanding equipment and buy this new automatic stroke sander, because it not only increases capacity, but gives that "perfect" finish which every finishing foreman has so long wished for. There are upright belt sanders, edge belt sanders, variety belt sanders, etc., each adapted to a particular class of finishing work, and it is advisable when figuring on sanding equipment, to get data from every possible source, to be sure of selecting the equipment which will return the most in labor savings, as well as insure minimum upkeep expense.

The oscillating belt edge sander is capable of a wide range of work, in addition to sanding plain edge. It comes in very handy for finishing square and octagon turnings which have been shaped on the automatic shaping lathe. In fact, any factory using this automatic lathe for square work, should not be without the oscillating-belt edge sander.

How Leaders Bring Down Costs

There are many small irregular shapes constantly passing through the factory which must be carefully sanded to prepare them for proper finish. They represent a class of work for which the variety sanders are well adapted. Legs of the Queen Anne style are most economically handled on such a machine.

In this day of sharpest competition and lower selling prices, it is necessary to utilize every mechanical device obtainable which will lessen the amount of costly labor entering the make-up of wood products.

The recent furniture markets have indicated what the leaders in the industry are doing along that line. Many quality lines sold at figures so low that a lot of other manufacturers can't seem to figure out where the producers get off without a loss. Well, they know prices must come down, and quality must go up. They have discovered it is possible to make good furniture at a reasonably low price, if there is no lost motion in the factory, and labor costs are kept at a minimum by providing each worker with the most efficient tools and machines to be obtained.

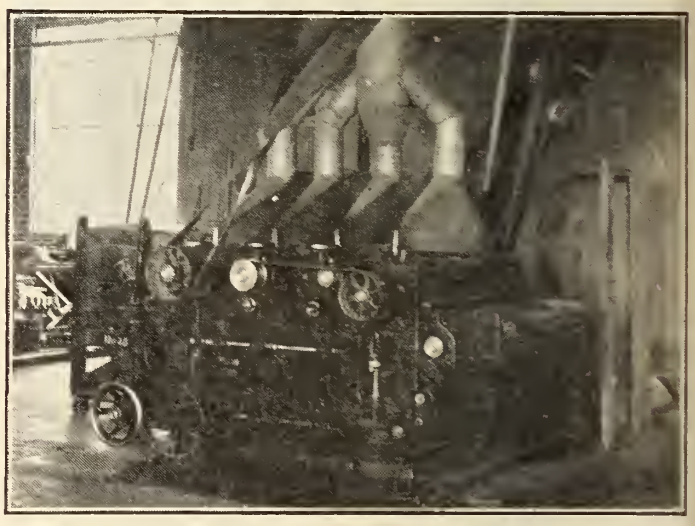
The Care of Three Drum Sanders

Generally speaking a three drum-sander is a much abused piece of machinery. It is expected to turn out a high grade of work, and in return receives as little thought and care as will keep it running. The designers of the three-drum sander, designed this machine to remove the grain and leave a smooth finish on work that had already been surfaced; but in many cases it is expected to do the wok of the planer, in addition to producing a fine finish.

The condition of the felt coverings on the drums plays an important part, not alone in the finish produced but in the life of garnet paper. There is no question regarding the economy of using felt, yet every now and then one will come across a firm which has substituted brussels carpet. When the carpet is first put on the roll or drums it makes an exceedingly good covering, but in a very short time it mats down and becomes hard..

The care of felts is something that receives too little thought. Very little attention will give surprisingly large returns, not alone in the saving of garnet paper but in the quality of finish turned out. The felts should be brushed with a good quality bristle brush each time the papers are changed. The best brush for this purpose is along the lines of the one used for currying a horse. A fibre brush or floor broom should never be used upon a felt. The reason for brushing is to remove the fine, dirty particles which gather and to keep them soft so that they will retain their resiliency. It is very important to use great care in keeping oil off the felt as a few drops of oil will gather and retain dust, and eventually form a hard spot which will make holes in the paper and will show on the finished work.

There is no standard or rule governing the grits of paper used on the different rolls. We often find operators producing good results with what seem almost impossible papers. The designers of the three-drum sander intended the first roll to do the cutting and the grit of this paper should be determined by the condition of the work when received by the sander. The second roll is designed to remove the scratches left by the first roll, and this paper should be only



Three drum sander in plant of Langslow Limited, Cobourg, Ont.

course enough to do the work which it was intended. The office of the third roll is to remove the scratches left by the second roll and give the final finish.

The selection of the paper for the third roll must be governed by the treatment the material is to receive and by the finish desired. If the work is to go to a belt sander after going through the three-drum sander, it will be found that most satisfactory results will be obtained as here the third or fine roll of the three-drum sander may be covered with number one half-paper. The reason for this is that all three-drum sanders press down the grain and leave a polish. The finer the paper used, the more pronounced the polish, so that where No. 00 paper is used on the drum, the man on the belt sander is obliged to go over the coarse paper to roughen it up before he can produce the finish required of him. Therefore, it has been proven that by using a coarser paper on the finish roll of the three-drum sander, the belt sander will turn out more and better work.

Combining Operations to Reduce Costs

Various Combinations of Operations May be Preformed on Double-end Tenoner

BY H. A. RALPHE

Furniture manufacturers may be divided into two classes, those who have double-end tenoners and those who would like to have them. Most of those in the latter class appreciate the efficiency and productiveness of the machine but are unable to see where they would have sufficient work to keep it going. It is true that to realize the fullest possible return from an investment in equipment, there should capacity every hour the plant is running. It is also true that a machine may be so efficient, so versatile be enough work coming along to keep it operating to and so productive that even though it is possible to keep it in operation only 50 per cent of the time, it would pay a sufficient return on the money tied up to warrant the investment. Such a machine is the double-end tenoner, which is in reality a double-end tenoner and double-end cut-off saw combined.

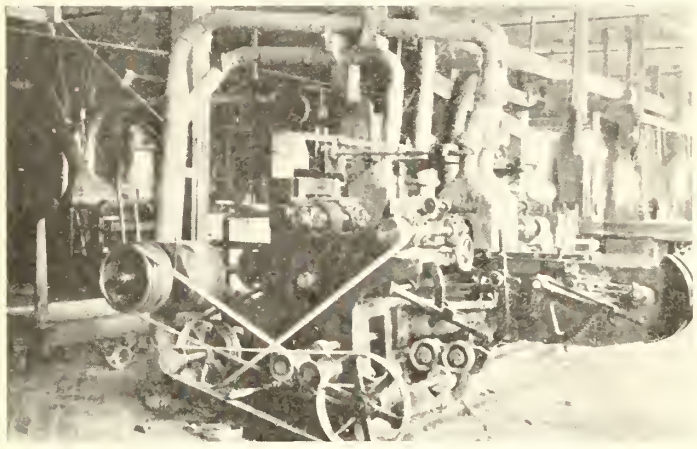
This may seem like a strange statement, but I venture to say that any plant worthy the name of furniture factory, would find a double-end tenoner a profitable investment. Doubtless exception will be taken to this assertion, but a brief outline of the field of usefulness of the machine will tend to confirm this stand. Just stop and think for a moment. The double-end tenoner will tenon, cope, trim to length, dado, end-groove or rabbet both ends of the material being fed through. This in itself eliminates one cut, for in any type of single-end machine, either saw or tenoner, the work must be turned end for end and a second cut made. More than that, many of these operations may be worked in various combinations, reducing the number of handlings and the cost of manufacturing still further.

How Operations May be Combined

The writer was in a plant not long ago and saw them trimming both ends of some stock and cutting a shallow rabbet at the same time. The set-up was simple. Saws the same thickness as the width of the rabbet but smaller in diameter were placed on the spindle with the dimensioning saws and then set for depth. Without this machine the pieces would have

View in Owen Sound furniture plant. Note boxes to catch end waste

been cut to length first and then each end rabbeted on either single-end tenoner or saw table. When one looks at the machine in this light and then considers how other operations may be combined, such as trim, tenon and cope, trim rabbet and dado, trim end-groove and dado, etc., and that different operations or different combinations of operations may be performed on the two ends of the stock at one time, it



Double end tenoner set to work stock 9" long

is then that the many advantages and full possibilities of the machine are realized.

The feeder is a continuous chain one, there being no drawback to the work. The capacity of the feed and of the machine itself is in excess of the ability of the operator to handle the stock. On certain classes of work several pieces may be placed in front of each stop, thus increasing the output many times. For wide stock, material up to 28 inches may be worked on the average machine, one or more stops are removed from the feed chain and the pieces sent through. This means that tops of tables and dressers, etc., may be accurately trimmed to length at a good rate.

Output Depends on Operator

It is difficult to give a comparative idea of capacity of the double-end machine, for it depends entirely on the type of work going through and on the willingness of the operator to hump himself. It is claimed that one double-end tenoner will turn out as much work as from three to six single-end machines, or about the same number of cut-off saws. It is a combination double-end tenoner and double cut-off saw of large capacity.

The amount of work put through often comes as a surprise to even those operating these machines. One manufacturer of kitchen cabinets came puffing into his office one day recently and exclaimed "I never saw the like of this double-end tenoner. I have just put through as much work in three-quarters of an hour as would have taken me three days working with old equipment and old methods. It certainly keeps a man hustling to keep up with it." A Hanover manufacturer relates how he dimensioned side rails for beds by picking up an armful at a time and laying them on the chain, letting the stops carry through as many as they could. In the hands of a practtical operator who is not afraid of using his head and figuring how diffedent combinations may be worked, there is almost no limit to the kinds of work that may be handled.

What's Your Opinion of Double Miter Saw

Proving Its Value as Production Machine in Many Furniture Plants—Wide Variety of Work May be Handled—Usefulness Not Confined to Miter Work

BY J. R. TRACEY

One type of machine that is coming widely into use in the manufacture of furniture is the double miter saw. This machine, is generally so constructed that it is equally well adapted to square work and to work with all kinds of simple and compound angles. The ability to handle square work as well as miter work permits its use in the smaller factories where they only feel able to install one double cutoff saw.

The gain in efficiency, both in saving of labor and in accuracy of the work by cutting angled work both

Automatic type double miter saw. Table automatically raises and lowers

ends at once, is easily understood. Where both ends of a piece of work are cut simultaneously the work is bound to be cut with the angles in the right relation to each other and the work to be accurate in length. This is true even if the work gauge should vary. The saws being positioned the work is bound to be of the right length and angle.

More Than One Piece Handled

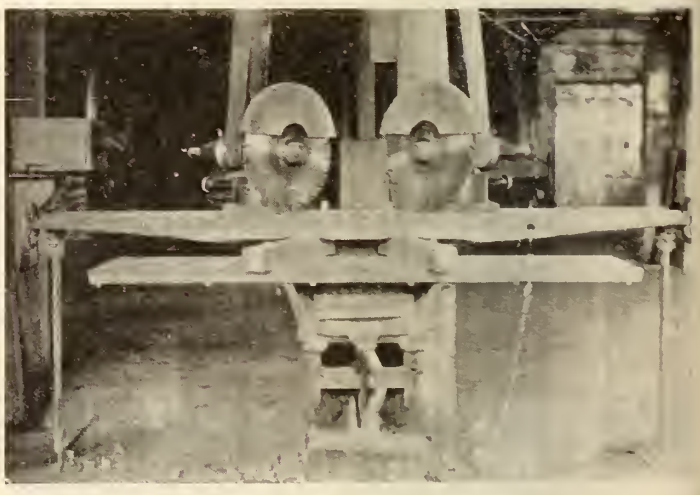
On all work that is square or with simple angles it has been found practicable to cut several pieces at a time. In one factory a record was made of cutting four thousand pieces of work in one hour, the work being about 7 inches wide and ⅝ inch thick and cut on the ends on an angle of about 17½ degrees. This was done by cutting the work six and seven pieces at a time, one man feeding the machine and another man taking the stock away.

In cutting compound angles, such as the domes of phonograph cabinets, casket parts, and similar work, it is only possible to cut both ends of one piece at a time. In cutting this stock, after the saws are positioned at the proper angle, it is leaned toward or away from the operator to give the proper compound. In fact, compound angled work is placed on the machine in exactly the same position that it occupies in the finished work, thus a casket side or end is cut nearly upright, leaning slightly back towards the operator, the amount of incline conforming to the flare of the casket.

Dadoing, Grooving and Even Tenoning

Double miter saws are also generally made so that the arbors will carry dado heads as well as saws, thus making the machine suitable for many kinds of dado and grooving work. It is also possible, by using saws along side of the dado heads, to dado the work and trim to equal lengths at one operation. As double miter saws are made with tables that travel up and down, grooving and dado work are cut with the work standing up on edge and carried in this position past the center of the front of the saws. In the same way, by swivelling the saws to an angle of ninety degrees, the work can be grooved in the ends and the machine used in some cases as a double end tenoner. Another advantage that the machine has is that any work can or square. Moreover, after the first cut is made each succeeding stroke of the table will produce two pieces. easily be cut into short lengths either plain, mitered,

In furniture work there are many uses for a saw of this kind. One Ontario manufacturer of extension tables, trims all his semi-circular rims on a double-miter saw. He swings the two heads around so that the saws are in line, and by using a large wood sub-table, fitted with adjustable stops, finds that this work can be handled to good advantage. Not only is it quicker than the old method, but is more accurate as there is no chance for any variation in the cuts made. This also holds true of rims for small oval tables; in fact for oval tables of any size. Each saw can be set



Double miter saw with treadle for raising table

at varying angles so that the different bevels on rim stock for oval tables can be cut at once. It is not difficult to set a number of stops to secure the sizes desired.

The ease with which the double mitre cut-off saw may be set up for different cuts is a very desirable feature. Elaborate forms and stops are not needed for the simpler kinds of angle-cutting. Practically all work is handled on edge. The saw heads are swung around to make the required angle and then adjusted for length. This leaves nothing but the fence and stop, or stops, to look after. In some types of machines, the up and down motion of the table is an automatic one. All the operator is required to do is lay the piece in place and remove it after the cut has been made. In a simpler design of machine, though

Upholstering and Trimming

The New Era in Upholstering

Tendency Toward Smaller and Daintier Upholstered Furniture—Canadian Upholsterers Should Create Not Imitate.

By W. O. Mendell

Strange indeed would it have been if the great world war, which left its indelible marks on every industry in the world and made such wonderful changes in every sphere of science, had passed the art of upholstery unnoticed. The contact of our men with the quaint old furniture in Northern France, Belgium and Italy, has brought a revival of the picturesque, the fine outlined, the dainty and the exquisitely carved furniture of the days of the old Venetian and Florentine masters and the years when a Chippendale, a Sheraton or a Hepplewhite swayed the designs and the texture of the English craft. These men evolved out of the heavy and somewhat clumsy, but eminently substantial, Dutch furniture the graceful and charming, the straight, structural and the elaborate but very practical furniture, full of beauty which has made their names immortal in the history of the woodcraft. Not only was their name heralded as master workmen but in their day the art of upholstering was given an impetus that with ever increasing grandeur and possibilities has reached until the present hour.

Truly kaleidescopic have been the changes that have taken place in the materials as coverings; now crude and almost vulgar, then again quiet and subdued, now classic in its outline and color and then again like the fantasie of the master musician breaking forth in a brilliance and daring of execution that dazzles the eye and keeps us spellbound with wonder and admiration.

To Much Stress on Size

From the brilliant parti-colored embroideries and brocades with their offerings of fruits and foliage, and flowers of the Jacobean period, ever increasing in brightness and masterfulness through the days of the petitpoint and grosspoint work of the years of William and Mary and Queen Anne until it reached its climax in the luxurious extravagances of a Louis XVI, when the finest brocades, Indian damask and velvets with its pastoral scenery were used to satisfy the ones whose circumstances allowed them to spend a small fortune upon upholstered furniture, leaving the great masses of people with the rough, uncouth and uncomfortable furniture of their day.

Then like a star came the influence of the American continent in the introduction of machinery and power in the industry of weaving, which took the upholstered furniture and brought it within the reach of the majority. But alas, in the evolution much of the daintiness was lost and there rose among us the furniture that was bought, not for its outline of grade and charm, but for its size, not for its undying spirit but rather for its amount of material. Inches was the standard by which every piece was measured, and there was a veritable rivalry among the manufacturers to outdo the other in size until our furniture became unwieldly and bombastic, gaudy and freakish. We are, however, on the threshold of a new era.

The Clumsy and Ugly Must Go

The verdict has gone forth. The clumsy and ugly must go and there comes a far-off cry, increasing in intensity, from the great majority whose housespace is limited and whose expenditure must be carefully balanced with their income, for low-priced upholstered furniture which does not offend the taste and in which at least an effort is put forth to return to the gracefulness of the periods. Something simple for the living room or the den and yet comfortable and at a price the people who are but common folk can satisfy their longing. The frames may not be of the elaborate design of the Napoleonic period, but it must possess some of the austere simplicity of the Dutch tempered by the gracefulness of a Hepplewhite or a Sheraton. The covering may be inexpensive but there is no reason why its coloring should not be dainty.

The future is before us. May we be able, out of the glorious past of upholstery, to evolve a still more magnificent enduring future, for let us remember that in every human heart there is a deeply imbedded hunger for the graceful and the harmony of color and of which much is lost in the great struggle of life. Let us as Canadians not be merely satisfied to follow on and be imitators of our neighbors, but as the fathers of the country hewed out of the dense forest the magnificent inheritance they have left us, so let us blaze the trail so that the upholstery of Canada may be noted for its noble design, its sturdiness of quality, its beauty of outline and its homey appearance that invites not only the admiration of the eye but gives the satisfaction of comfort when the toil of the day is done.

Bulletin on Cutter Head Grinding

A bulletin on grinding cutter heads, showing how fast feeds, constant operation and large production, insuring a greater margin of profit in addition to increasing capacity for handling a larger output are possible, is now ready for distribution to the trade of the S. A. Woods Machine Company, Boston, Mass.

This bulletin is illustrated and shows clearly how to do a number of things on a cutter head grinder that are not understood by all millmen—such as grinding clearance bevel on ordinary carbon knives while in place in the standard square head; grinding thin high-speed knives in place in the round head; grinding the cutting or so-called back bevel used for hardwood planing on the ordinary carbon knives in the standard square head, etc.

This illustrated bulletin, free for the asking, shows how to eliminate lost time in the mill and grinding room, improve the finish, minimize manufacturing costs and simplify the work of the men in the mill.

Packing Upholstering For Shipment

Appearance Often Marred Due to Faulty Packing—Stuffing Seldom Comes Back if Compressed for Any Length of Time -- Points Which Require Special Attention

To the practical upholsterer, furniture which is made on the K. D. principle is usually associated with unfinished work, such as backs partially tacked to allow for bolts, arms that must be left open at certain parts to allow for screwing, and under-seat coverings temporarily tacked. These and other such technical details have to be studied in order that the various parts when assembled permanently will have none of the appearance of K.D. work, Says F. Palmer in the "Cabinet Maker." There is a great demand for this type of upholstery abroad, but unless it is carefully handled both in packing and assembling at its destination it rarely presents so smart an appearance as upholstery not built on the K.D. principle. The finished job not infrequently shows some outward sign, more or less pronounced, such as visible screws or bolts, that the frames are made for taking apart. There is no need for this, and the field for improvements in the manufacture of K.D. frames as well as in the upholstery is a wide one.

Points to be Watched

It is highly important that more than ordinary care should be exercised in upholstered work for shipping, as complaints are difficult to deal with at such great distances. It is generally the stuffing or covering material that becomes damaged in transit, and therefore special attention should be given not only to the workmanship but to the packing of the goods when finished. Fig. 1 is lettered to show those parts of a of a stuffover easy chair which are likely to become unsightly when compressed for a long period, or jammed into a packing case which is too small to take it. It is more essential that ample packing material is given at these parts, which in addition, should be protected by outside slats. In this way the appearance of the chair is preserved, and the possibility of complaints much reduced.

There are many devices on the market for K.D. chairs, but nearly all are based on the same principle. For export purposes it is necessary to get the greatest number of chairs into the least possible space, and to ensure this the chair-back must be made detachable. This is probably the source of the greatest weakness in K.D. stuff, for however, the joints may have been it is obvious that the various parts cannot be assembled quite so successfully after the work has been upholstered as when in the frame stage. The tenons or dowels must be glued; this involves the use of cramps, and thus there is always a danger of the covering material being damaged by tools or rough handling, and of the stuffed edges, which are of such importance to the appearance of good work, being forced out of shape. The need appears to be for backs made on the telescopic or folding principle, which would allow of the upholstery being completed, and do away with the use of glue cramps when the work is assembled.

K.D. suite frames often present difficulties to the upholsterer who, unless he happenes to be an expert and knows exactly how to manipulate the stuffing to the best advantage, is apt to waste much time in putting the work together and taking it apart again There is also room for experiments with chairs made of such dimensions as to fit together when packed without displacing the upholstery. For instance, three-piece suites might be so designed and the length of the settee so adjusted, as to allow of the pieces being packed together in a small amount of space.

Should be Packed Separately

Large stuffovers are usually made on rigid frames, and the ample room afforded by the seats is regaded as a safe place for depositing breakable goods or small parcels that require careful storing. Stuffover seats are frequently damaged in this way. The packer will force packages between the seats, arms or hollow of the back just because the stuffing will give, and makes a tight fit possible. This does the upholstery no good, and is very likely to damage or stretch the covering material. An ugly fullness and saggy appearance is caused by long compression of the stuffing, and this is a frequent cause of complaint. Compared with the cabinet maker the upholsterer is at a disadvantage in making work for export, unless it is most carefully packed. The fine lines of the upholstery are soon marred by rough handling, careless or unskilful packing with other goods, or by the covering material becoming slack owing to long compression.

Although it is true that cabinet work may be spoilt by breakage or the polish straw-marked or scratched in transit, the packer cannot take the same liberties with case goods as he does with upholstery. Stuffover upholstery needs extreme care in handling and packing if it is to be presentable when it reaches its destination. Everything depends on the contour, and if the stuffing is compressed unequally or the projecting parts of other goods are allowed to impinge on the stuffing, the impressions made sometimes become permanent, and the original shape of the upholstery cannot be restored.

When a variety of goods is to be packed in a single case the packer naturally aims at fitting them together conveniently without any superfluous space between them, and thus endeavours to avoid the need for wads and cramming. Unfortunately, little consideration is given to the fact that stuffed goods are more liable to damage in this connection than cabinet work It is too generally assumed that the upholstery can be forced into position in the case, but when this in donc damage frequently results.

Poor Packing Expensive

The writer hopes he will be forgiven for dealing so hardly with packers, but a long experience of shipping work in all stages has convinced him that many complaints of faultly workmanship in the upholstery when investigated can usually be traced to inadequate methods in packing.

At Fig. 2, a stuffover arm is shown. When unpacked such an arm not infrequently appears as shown at Fig. 3, and unless it receives some technical attention at once it seldom regains its original shape. Buttoned work, see Fig.4, calls for special care, otherwise the appearance is very ugly owing to the fulness given to the material. This style of upholstery should

Illustrating how furniture is damaged through faulty packing

be kept free from any heavy pressure such as the backs or legs of chairs placed in the seat to economize space. The damage which is liable to occur to outside arms and backs is indicated at Fig. 6. When pressue occurs through careless packing the line of the tacking rail shows distinctly through the outside covering. In this connection it may be remarked that upholsterers frequently neglect to place a little padding on the stuffing rails.

Upholstering work with spring edges also needs careful packing, otherwise the edge tends to fall inwards and ruins the appearance of the seat. The front of this style of work should be well padded and always protected with outside slats so that the compression is equal on the whole surface. Nothing but entirely removing the front will restore a spring edge seat damaged as indicated at Fig. 8.

Care of Electric Motors

Motors, generators, or any form of electrical machinery should always be fixed to a solid foundation, for preference a solid concrete bed prepared expressly to receive it, and not, as one so often sees it done in sawmills and factories, simply belted down to a wood floor, a couple of joists, or even a single plank.

In cases where motors require to be fixed on an upper floor, or on a wall bracket or similar structure, every endeavor should be made to obtain as far as possible a solid, rigid, vibrationless bearing. Many breakdowns can be traced to unsteady foundations, this being particularly the case in direct-current machines, where sparking and chattering of the brushes has been the result.

Generally, motor bearings are of the ring-oiled type—efficient enough while in order, but always liable to give trouble if neglected. The ring may become slightly damaged, it may lose its concentricity, wear into a flat place, become distorted. This stops its functioning, it ceases to bring up oil from the well to the journal; heating occurs, and the destruction of the bearing is not a long way ahead.

As a result of the oil being repeatedly used, as it is in this type of bearing, it is very liable to oxidise, to become gummy, to hold in suspension dirt and dust; in time it may become so thick as to hold the ring. The remedy is occasionally to empty the oil well, wash out the interior with paraffin, and to refill it with clean, fresh oil.

Beware of over-filling the oil chamber of a ring-oiled bearing. The practice of adding a small quantity of oil every time a motor is started up is not only unnecessary, but wasteful. Over-filling means a messy bearing, which collects dirt and dust; it may also mean the escape of oil along the shaft and on to the windings of the motor, where it may do no end of harm.

Getting the Most From the Trade Journal

by H. W. Strudley

Manager, Imperial Rattan Co., Limited, Stratford, Ont.

We have passed through what might be called a soft period of merchandising. From 1918 to 1920 all who had goods for sale could sell them at such prices as they chose to ask. The fall of 1920 began with a fall in demand for over-priced materials of all kinds. Here the law of supply and demand slipped in and the law of the survival of the fittest in business began to function. Liquidation is still in order and until it is completed, business will not be normal.

With the healthy reaction of competition again with us, it behooves the man of business to scrutinize his spending departments to cut out waste, to exact economical production and reductions in costs so that his products may be available for the reduced income of those who would buy his wares. It also behooves the manager of factories to be alert and anxious to please his customers with improved products, new ideas and better values. 6

Most every trade has a journal of particular interest to itself, and the management of these journals in self interest endeavors to make them interesting and instructive. They secure advertising from machinery and raw material supply people of special interest to trh trade served. I have found these journals of much interest and profit. Every machine or supply advertized is carefully scrutinized with the idea of improving our product. Every message from fellow-manufacturers is read carefully and, if applicable, passed on to the department interested. The journal gets to the waste-paper basket only after all "ideas" are used or absorbed, or because it has nothing to contribute to the efficiency of a plant. We believe a trade journal can be used to advantage in every plant and that its chief aim should be to pass on information from those who have products needed to those who need them with the "big idea" of serving the public by giving them the luxuries of life at the least possible cost commensurate with fair wages and fair return for capital invested.

Valuable Book on Costs

The National Association of Cost Accountants, New York, recently issued their year book for 1921. This is a very interesting and instructive volume of 400 pages and is one of the most valuable collections of cost material which has ever been brought together. Including in it is a full report of the second international cost conference held at Cleveland, Ohio, last September, together with papers and discussions on such interesting and practical subjects as"Interest As An Element in Cost;" "Cost System as a Means of Preventing Waste;" "Uniform Methods and Standardization Cost;" Distribution of Overhead under Abnormal Conditions," and "Executice Uses of a Cost System." Each of these subjects is covered by a number of papers prepared by men who are experts in their particular fields. A full report of the ensuing discussions is also included.

A copy of this book may be secured from the secretary, S. C. McLeod,130 West 42nd St., New York. The price is $3.00.

New Finishing Material Proving Popular

Recent Exhibitions Show Popularity of Lacquer Finish—Produces Wear and Heat Resisting Surface

By W. H. Dawson*

Styles in furniture, like modes of fashion, are constantly changing. How different are the finishes of today from those of yesterday? It is not so many years ago since the high polish furniture was "all the rage". Golden oak was a familiar example of such finishes. In those days, the more coats of finishing materials that a manufacturer could pile on his furniture—the better the finish was considered. The natural beauty of the grain of the wood was often entirely obscured. Then came a reversal of popular opinion. The public were tired of these glaring finishes and demanded something more subdued. The so-called rubbed or dull finishes partly satisfied this demand, but even these finishes were not yet just what was wanted.

Imported woods such as mahogany and circassian walnut became quite popular until the war conditions made these woods very scarce. Furniture manufacturers then began looking for another material to take the place of these imported woods, and of necessity turned to native oak and walnut. The value and beauty of these woods were recognized and our own woods began to come into their own. The manufacturers realized that the old finishes would not do, and what would be the new finish, was the all-important question.

Development of Lacquer Finish

It was just about this time that wood lacquer was perfected and this new material opened the way for new finishes. Furniture manufacturers have not been slow to take advantage of this new finishing material. The furniture exhibitions held recently at various centres gave an indication of how this material is taking. There was hardly a line on display which did not include one or more pieces in lacquer finish. This was particularly true of the American exhibition for there, it has been stated, that lacquer was the most popular finish on the market.

The latest development in finishes on oak and walnut, is known by various names. Some manufacturers call it the Italian or Italian Renaissance finish. Others call it Antique Oak, or Walnut, Dusty Walnut, etc. The finish was introduced six manths ago and has obtained an almost phenominal success. While colors and shades vary with different manufacturers, they may be described in general.

Italian Oak is a deep rich brown. It is filled with a dust-colored filler which gives the "dusty" appearance. Italian Walnut is also a "dusty" gray finish. Perhaps the most popular shade is a gray with a slight greenish cast. Other shades are blue gray or pearl gray. All are open pore finishes and semi-filled with the "dusty" filler mentioned. Wood lacquer has made these finishes possible. The Italian finishes can be produced at a lower expense than other finishes, with no sacrifice to quality or beauty.

Italian Walnut and Italian Oak Finishes

The accepted formula for producing the Italian Walnut finish was recently published in these columns but it may not be amiss to repeat it.

Italian Walnut

Sand wood smooth, and stain. To make the stain, take

Nigrosine Green Black ..... 1 Oz.
Warm Water ..... 1 Gal.

Where sap streaks exist in the wood, add ¼ oz. Crystal Sulphate of Iron to the formula. Dry thoroughly.

Spray on a coat of lacquer thinned 30% to 50%. Spray at 25 to 30 pounds pressure. One coat is sufficient but two coats may be applied if more body is desired. Let this dry for about four hours and sand smooth.

Now rub in a coat of wax, to which dry Zinc White has been added. Take 3 parts wax to 1 part Zinc White. Wipe off the excess wax to the desired tone. (Caution: the Zinc White mixture should only fill the slight open grain of the walnut.)

Italian Oak

Sand wood smooth, and stain. To make the stain, take

Italian Oak Stain Powder ..... 1 lb.
Water ..... 2 gal.

Flow the stain on the work, giving it plenty of time to penetrate, so that a deep rich brown color is secured. (If a lighter shade is wanted the stain may be reduced).

When thoroughly dry sand lightly and fill with a mixture of rottenstone, turpentine (or naptha) and a very small quantity of Japan as a binder. For quick work use benzol instead of turpentine, but care must be used in applying such a filler as it dries very rapidly and will have to be cleaned off at once.

Spray on a coat of lacquer, thinned 30% to 50%. Spray at 25 to 30 pounds pressure. One coat is sufficient but two coats may be applied if more body is desired. After drying for about four hours, sand and wax. Mix a little rottenstone with the wax or apply a coat of wax and sprinkle on a small quantity of rottenstone. Dust off and rub to desired polish.

It is difficult to describe the beauty of a wood lacquer finish. It hasa softness of tone and a velvety

*Celluloid Zapon Co., Wilmington, Dil.

richness that at once attracts and appeals to all who know fine finishes. The great transparency and toughness of the coating fulfills to a considerable extent, the dream of the finisher for a new finishing material.

The distinctive qualities of wood lacquer may be briefly summed up as follows:—It will not scratch readily nor show white marks. It is hard, durable, elastic and water proof. Hot dishes and steaming liquids cannot mar it. It will not "check", "craze," nor paper mark. It dries rapidly—(dust free in 15 to 20 minutes) and extremely level, consequently there is little material to rub out. No sanding between coats is necessary. These qualities point the way to a big saving of time in the finishing room as it is possible to apply several coats in one day.

These finishes are very popular seemingly having caught the eye and fancy of the furniture buyers. When the durability of lacquer as a finishing material once becomes established it will likely become more popular than ever.

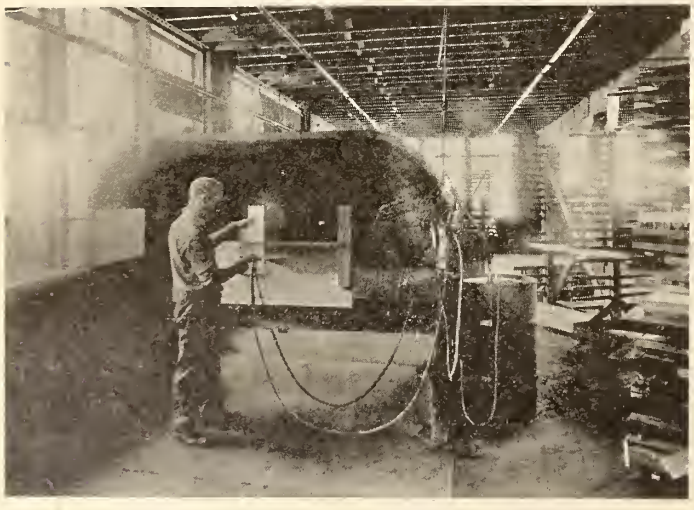
Are You Spraying Shellac, Stain or Filler?

Modern Method is to Apply all Finishing Material by Spray Equipment—Excellent Results Being Secured—Reduces Labor Costs and Increases Productiveness of Department

A Few Practical Suggestions

By Emil E. Frey*

This is a mechanical age. Shop-worn, laborious hand methods are replaced by the more efficient and modern ones. Those who have been slow in the adoption of these improved time and labor saving methods are handicapped in this period of downward prices. Competition is keener than it has been for years. Improvements in methods must come. All devices which are designed to maintain quality but reduce production costs must be given deeper and more serious consideration than ever before. The widest possible use must be made of those devices or methods at hand. This applies generally to all fields and especially to the furniture industry. What has been found essential in the cutting-out and fabricating of furniture is also essential in its finishing. The use of brushes in the finishing room is almost done away with. Applying any of the finishes by the brush method is as costly and as inefficient as the cutting or planing of wood by hand. The method of finishing furniture which has cut costs, increased production, improved finishes, saved space in the finishing room and placed it on an efficient more healthful basis is the mechanical application of stains, fillers, shellacs, varnishes, lacquers and enamels by air.



Applying stain by spray method

A spray-finishing equipment consists of a compressing outfit, an exhaust outfit, and the spray unit with its accessories. The size depending on class and nature of work. The compressing outfit consists of an air compressor of sufficient size to furnish the required number of cubic feet of free air per minute, air receiver and motive power. The exhaust outfit consists of finishing booth, in which the work is coated, and exhaust fans. The spray unit consists of material containers, hose, spray guns, air regulating and purifying means and dusters.

*DeVilbiss Mfg. Co., Toledo, Ohio.

Judging Most Suitable Pressure.

Stains, owing to their light consistency are applied with a small nozzle spray gun, the pressure required to atomize not being very high. Regardless of the material to be sprayed just enough pressure should be used to thoroughly atomize it, this may be 25 pounds in some cases while in others 80 pounds. The more viscous materials require the higher atomization pressure. Uniformity in application is the only caution necessary and can be easily accomplished when applying stains by spray. Even, rapid strokes, with the grains, making proper laps and starting and stopping the spray at the beginning and completion of each stroke will insure perfect results. It is essential to keep the spray properly lined up and adjusted for spraying all materials.

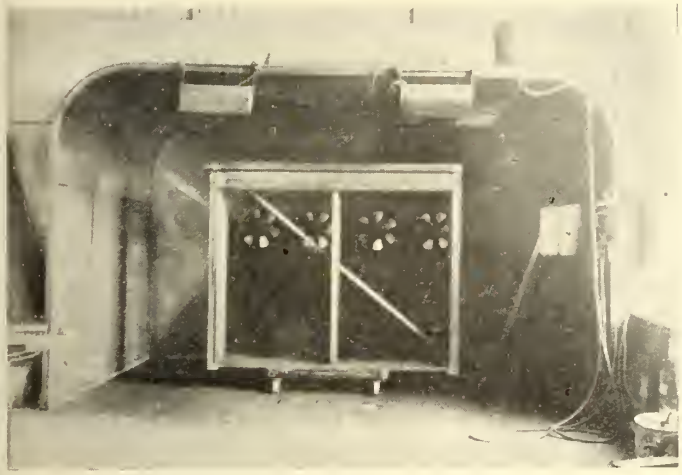
Filling of woodwork is the first important step or the foundation upon which the final finish depends. Improper or careless application and rubbing of filler is not considered serious, but here many times lies the root of the pinhole evil. The material to be sprayed should be of the proper consistency for each kind of wood. Best results are obtained with a mixture of about 8 to 10 pounds of paste to the gallon. Having the proper mixture, care must be exercised not to use excessive pressure. The range of pressure at which fillers of different consistencies are successfully applied is from 25 to 35 pounds. Material must be agitated continuously. Sprayed filler is applied much faster and more uniformly.

Can Shellac Be Sprayed Successfully?

The practicability of spraying shellacs has been discussed pro and con. The continued use of the spraying equipment in the larger and more progressive furniture manufacturing establishments for the handling of this material is a vindication of the spray system. Shellac to be properly applied by this method

should not be mixed over 2½ pounds to the gallon. On account of the highly volatile solvent, high air pressures are never recommended. Spraying at close range will not only save material but will in connection with proper mixture and air pressure, give a smooth, more uniform surface than is possible by brushing. This will again result in saving in the sanding operation to follow. A medium sized nozzle is recommended for spraying shellac.

Varnishes and enamels were among the first materials to be successfuly sprayed. The materials giving good results when brushed were found to give equally satisfactory service when sprayed. Occasionally the spray was blamed for inferior finishes, it



Large spray booth in Kent-McLain showcase factory, Toronto

being claimed the material was not suited to the method. There is no ground for such claim. Irregularities in the finish can always be traced either to inferior material, improper treatment of the undercoats, too rapid drying or misunderstanding on the part of the operator. But the spray equipment is not to be held responsible for defects due to improper filling, improper sanding or rubbing, poor material or operators who do not understand the equipment they are working with.

Does Spray Cause Pin Holes.

Such defects as pinholes and pebbling are often laid directly to the spray. Pinholes can invariably be traced to the filling coat. If the pores are not properly filled a high class finish cannot be expected. What holds for the brush will hold for the spray. Pebbling is due to an imperfect flowing out of the material. Varnish, work, or finishing room not being of the temperature required for good work, is commonly the cause. Cold varnish applied to a surface of different temperature in a room of a still different temperature will not give good results when brushing, neither can good results be expected from spraying under such conditions. Oil or water in the air is a condition which causes trouble. Holding the spray too far from the surface and swinging it recklessly back and forth and expecting the surface to be uniformly covered at the end of such a series of physical exercises is beyond all reason.

To insure a perfect sprayed coating use the following precautions: 1. Have the material, your work and the finishing room at as near even temperature as possible. 2. The air must be free from oil and water. (Condensers are to be had for removing moisture, also filters for oil and means for controlling the air pressure). 3. Use even strokes in going across the surface in systematic fashion, being certain that laps are properly made. 4. Electric heaters for heating both air and material counteract the natural cooling tendency of expanding air and frequently overcome the pitting effect.

How to Secure Best Results.

Lacquers are being used quite extensively in the finishing of furniture today. The only practical way to coat the average piece of furniture with this material is by the spray method. Lacquers, requiring a highly volatile thinner, are sprayed with as low an air pressure as is consistent with good results. Too high

Development of Walnut Finishes

Different Methods for Handling This Wood—Yellowish Brown and Dark Brown Tones Popular—Pale, Light-bodied Varnish for Best Results

By Paul S. Kennedy*

The present vogue of walnut furniture has had a decided effect upon piano finishes in particular. Curiously, there has not been a pronounced increase in the output of walnut cases, but there has been a decided change in the finishing of mahogany. Among the producers of the better class of instruments harmonizing brown stains now predominate, whereas reddish mahogany finishes were formerly standard.

During the war, difficulties were encountered with the satisfactory supply of red anilines and the furniture adopted browns in the emergency. The public eye having been trained to regard mahogany as reddish and walnut as brown, it was psychological that the brown stained mahogany should stimulate a demand for the walnut. Coincident with this, is the demand for pianos to harmonize in finish with walnut furniture.

What the Buyers Want

Because of the peculiar grain of walnut, and the sappy portions in veneers, it presents some finishing problems and possibilities which are being exploited to feel the public pulse. The writer has talked with the heads of two houses quite generally regarded as the leaders in the piano and art furniture fields. Both agreed that their idea of the finest finish on walnut was one which showed the grain and imitated closely the painstaking French Polish finish so popular in Europe.

The piano man thought the ideal finish, after staining, was to double-fill and carefully clean off: four coats of thin shellac (about 1½ pound cut) brushed on and sanded between coats with six 0 sandpaper; then rub in a circular motion with double 0 steel wool.

The furniture man was partial to one coat of filler and one or two coats of pyroxalin lacquer sprayed on and rubbed when dry with double 0 steel wool. These were typical of the highest type of art finishers, who cater to a limited and exclusive trade.

Sounding the feeling among others, most thought that the general buying public would demand a varnish finish; and that the popularity of grain-showing and antique finishes with them would be spasmodic; especially if some of the finer touches of cabinet making were lacking.

Tendency in Shades and Tones

The color tendency in walnut finishes is divided between a so-called cold or yellowish brown and a warm dark brown. There is generally very slight

The Finisher's Dream Realized

The dream of the furniture finisher, that some day there would be found a finish that would eliminate many of the troubles of the finishing room, and at the same time would produce results superior to any other known process has been realized in ZAPONITE, the Pioneer Wood Lacquer.

ZAPONITE is a *real* wood lacquer—not an experiment, but a real, honest-to-goodness finish.

ZAPONITE will do all that is claimed for it. It produces a finish that is hard, durable and water-proof. It will not scratch nor show white marks. It will not check, paper-mark nor craze. Steaming dishes and boiling liquids do not mar it—it is unaffected alike by heat or cold.

What more could be desired in a finishing material?

Why Waste Money in Your Drying Room?

Air-drying of coatings of any kind is out of the question. No manufacturer could afford it even if the best drying conditions always prevailed—which they do not.

But with Nichols Varnish Drying Equipment you always have very much better than the best natural conditions, reducing days of drying to hours, and the drying is better done: "From the inside out."

This is accomplished by producing always and automatically the correct combination of temperature and moisture, and of air that is absolutely clean.

Why is a Spray Head?

Furthermore, the spray for washing the air in Nichols Drying Equipment is produced in a simple and ingenious manner without the use of the spray nozzles, connecting pipes, pump, and strainers, all of which require so much attention and give so much trouble.

We urge manufacturers to ask us for description of apparatus and for records of its accomplishments, saving single manufacturers many thousands of dollars in reducing the time the product is held up in drying, and increasing the quality besides..

Increasing the Speed and Decreasing the Cost of Your Finishing Room Operation

How practical, how advantageous and how dependable DeVilbiss Spray-painting equipment is, has been demonstrated in finishing rooms of every size and line.

Not merely in dozens of finishing rooms, but in thousands of them. Not only where a few different kinds of articles are handled, but where every kind, size and grade of wood or metal product is finished. Not alone where varnishes, enamels or lacquers are used, but where every kind of liquid finishing material is applied. The

DeVilbiss
Spray-painting System

offers a complete, adaptable and guaranteed service. The finishing operation is speeded up 4 or 5 times over hand-brushing. A perfect, uniform coating is applied on all jobs. Working conditions are made more healthful and safer. Operating and upkeep costs are reduced to the minimum.

With your consent, we'll gladly tell you whether and how the DeVilbiss System can be of service and profit to you.

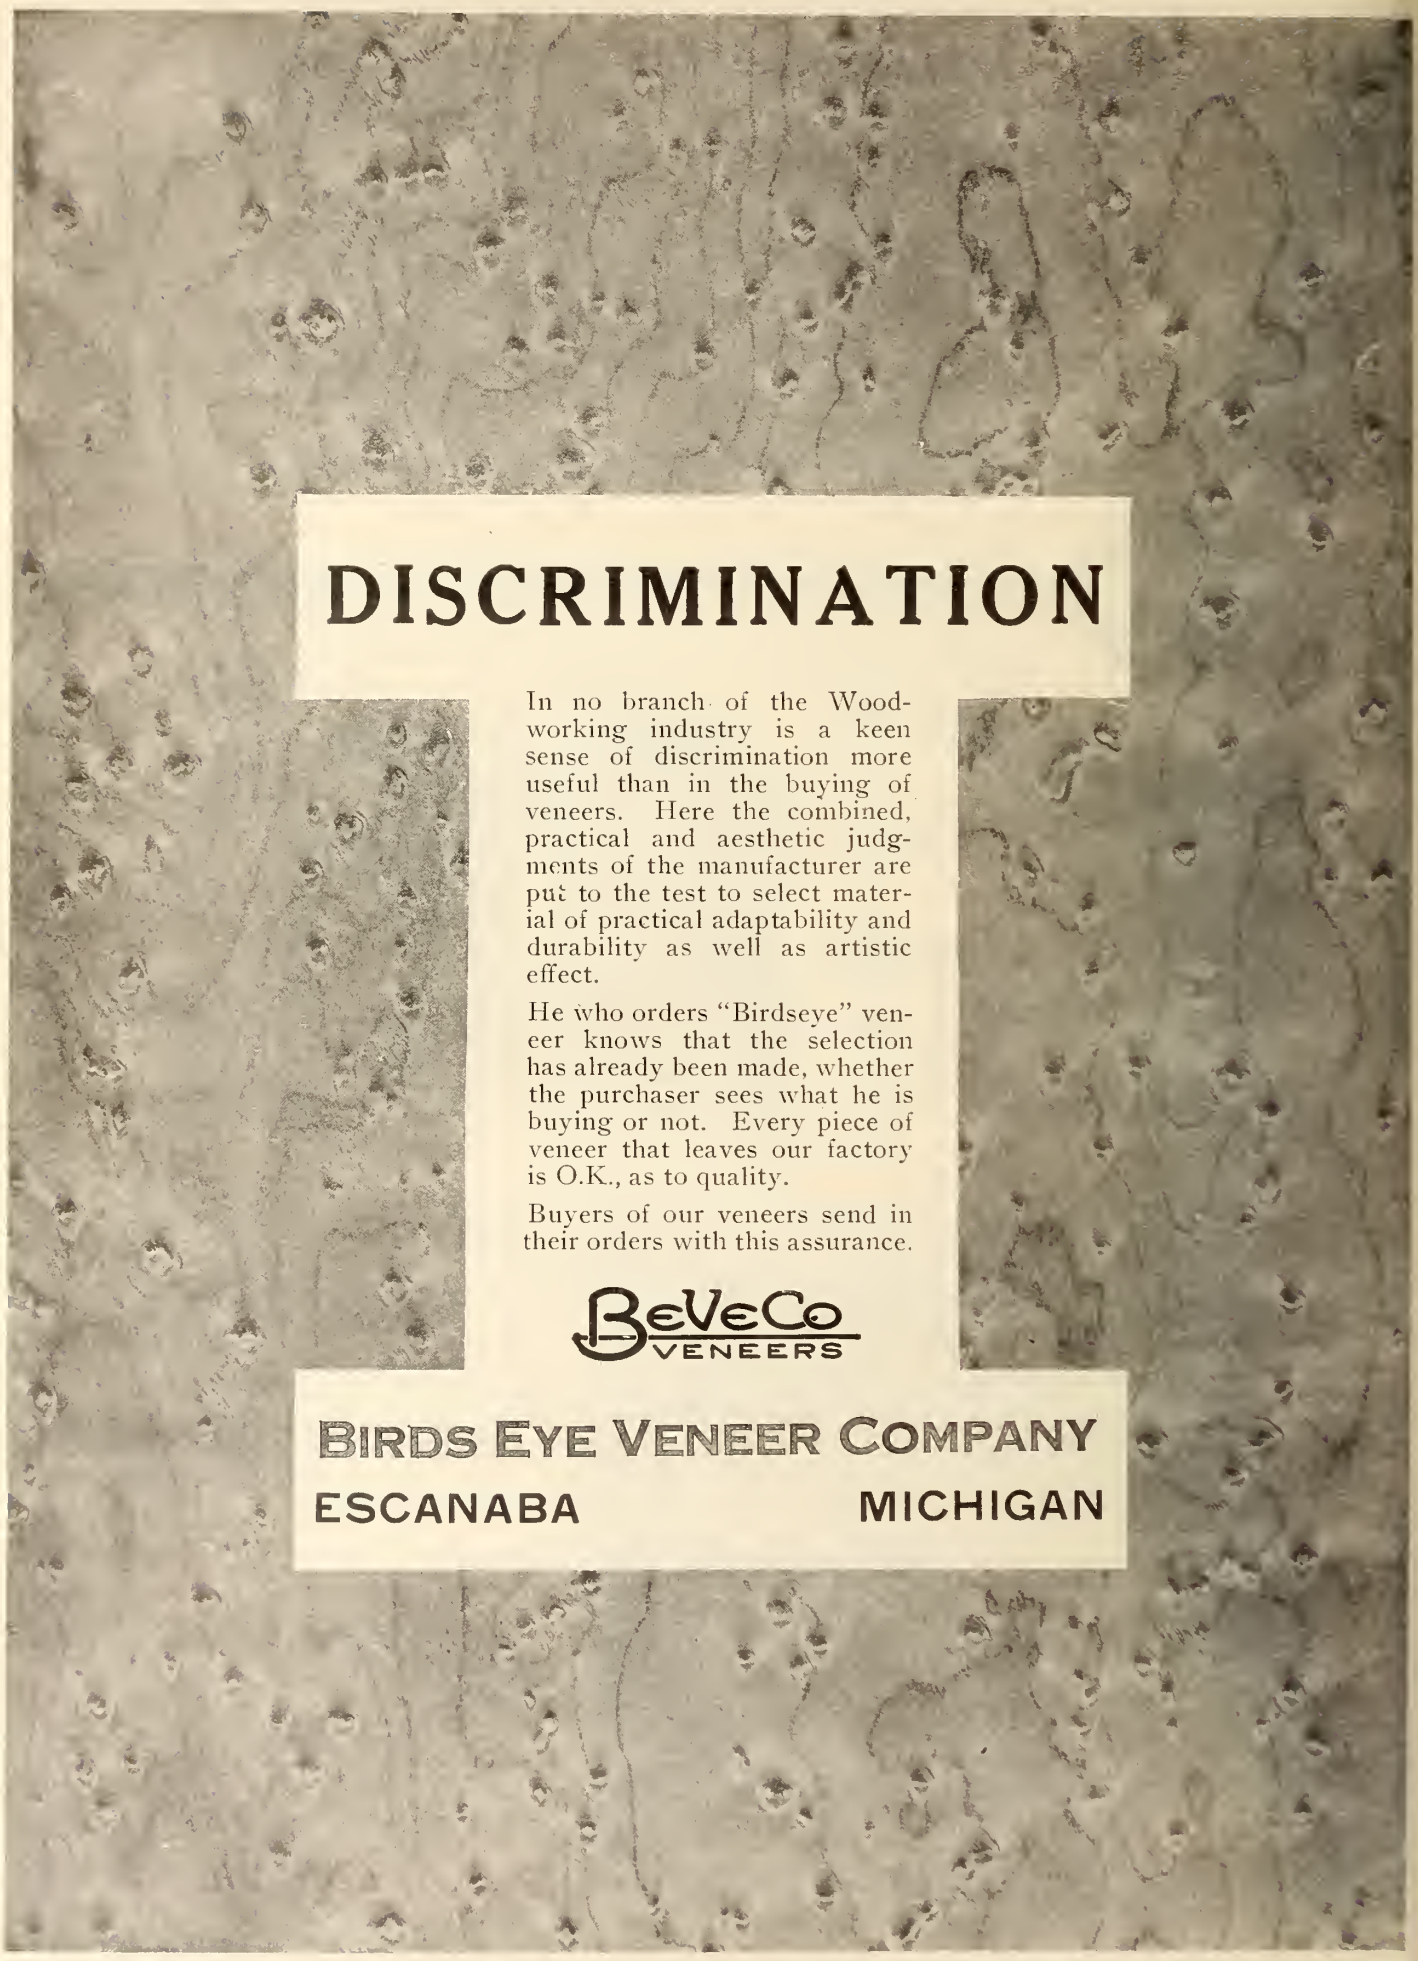
Paasche Air Brush Co.
1223 W. Washington Blvd., Chicago, Ill.

On all surfaces that are to receive hard wear a finish put on with a Paasche Air Brush will give many times longer service because the Paasche method gets better penetration of the paint or varnish; because the air brush puts the finish on smoother with no runs, sags, or fatty edges, and no thin spots to wear through. As a protective measure, a Paasche finish can not be equaled with the old fashioned hair brushes.

Write us for full particulars and for our suggestions

Here's a Suggestion

Do you ever try keeping a file of your back copies of the "Canadian Woodworker"? Try it. Start with this issue. There are many articles that are worth keeping, as they offer valuable suggestions that will help you in your business.



DISCRIMINATION

In no branch of the Woodworking industry is a keen sense of discrimination more useful than in the buying of veneers. Here the combined, practical and aesthetic judgments of the manufacturer are put to the test to select material of practical adaptability and durability as well as artistic effect.

He who orders "Birdseye" veneer knows that the selection has already been made, whether the purchaser sees what he is buying or not. Every piece of veneer that leaves our factory is O.K., as to quality.

Buyers of our veneers send in their orders with this assurance.

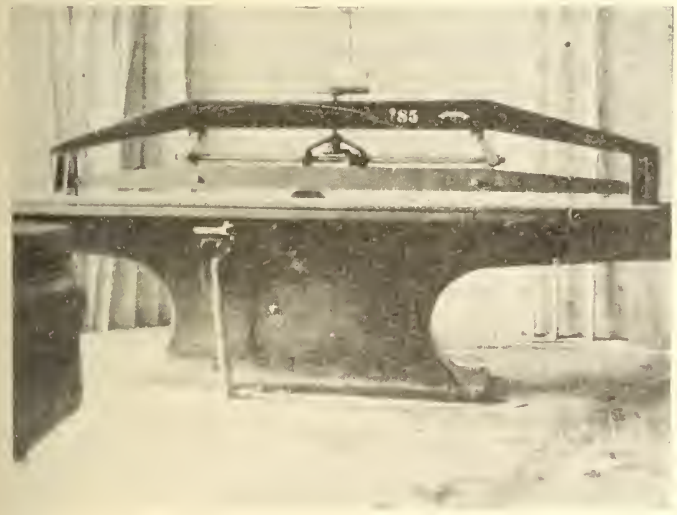
Is Your Veneer Room on an Efficient Basis?

Many Veneer Departments Lack Special Redrying Equipment—Essential That Stock be Dry and Straight—Labor-Saving Machines Play Important Part in Veneering Operation

By Edw. D. McConnell*

The two prime factors of greatest interest to furniture manufacturers are quality and quantity production; particularly now when quality is the keynote to success. In the manufacture of furniture, particularly that made from solid lumber, a great deal of attention has always been given to the proper drying of the stock. The study of efficient drying methods has at one time or another claimed the attention of most successful furniture makers. By the drying of lumber, we refer not only to the proper kiln-drying of the stock going into the product, but also to the lumber used in making up cores, when veneers are employed for surface effect in producing fine figured stock.

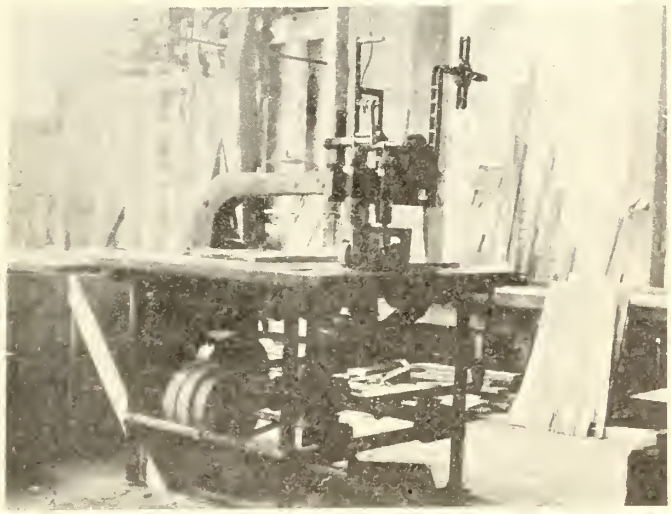
Few furniture manufacturers would think of taking the lumber from the yard or storage and making it up into the finished product without, at least, making some attempt to remove what surplus moisture it may contain. Yet this is exactly what many are doing in the case of veneers. They work on the theory that the veneers they purchase are thoroughly dried by the manufacturer and shipped in closed cars



Preston veneer jointer in plant of R. Laidlaw Lumber Co., Toronto

to destination where they are unloaded and placed in storage and assume that the veneer is suitable for gluing without any further attention. This is a serious mistake, as veneers take up atmospheric moisture quite readily, both in transit and while in storage. As a result they contain entirely too much moisture to be laid without re-drying, especially when account is taken of the fact that the glue itself contains moisture which has to be absorbed by the veneer and core.

When it comes to the manufacture of furniture in which veneer and plywood predominates, the fact seems to have been overlooked that the drying of



Veneer taping machines are found in more up-to-date plants

veneer requires as much, if not more, care and attention than the drying of thick stock. Due to this lack of knowledge or lack of care, a considerable amount of trouble is experienced with built-up or veneered material. This takes the form of the veneers peeling or blistering, the edges coming loose, and often trouble with the finish. The fine checks, sometimes called "varnish checks," which so often appear, are due almost entirely to the veneer not having been properly dried before laying, and as a result checking under the surface of the varnish. Poorly-dried veneer is often the cause of pitting. In like manner the wavy effect so often seen on table and dresser tops and other large surfaces, is directly due to improper drying in nine cases out of ten.

Defects of this nature reflect back on veneer and on any product on which veneer is used and may be given as one reason why the retail furniture dealers, and the buying public in general, usually prefer solid to veneered construction. This, in spite of the fact that if made right, veneered or built-up furniture is far superior in every respect to that made of solid material.

Equipment for this Department

For this reason if for no other, the manufacturer of furniture should give special attention to the drying and re-drying equipment which he has installed

*Merritt Sales & Engineering Co., Lockport, N.Y.

in his plant. This includes the operation of the drying apparatus, for trouble may result because the operator is careless or is not thoroughly conversant with his equipment and work. Sometimes, however, the trouble is due to the fact that the equipment supplied is not altogether suitable for the work on hand.

The veneer department in a moderate-sized furniture factory might well contain the following equipment:—A strong, durable dimension veneer clipper for sizing the veneers to approximate sizes ready to glue up: a hot plate veneer re-drier to remove all moisture from the veneers, which at the same time leaves the stock in a flat condition, this redrying process also shrinks the veneer to a minimum by removing the moisture: Two glue mixers and a spreader of approved design: One hydraulic press with loading and unloading device and sufficient retainers and caulboards to allow the stock to remain in clamp until the glue is properly set. A seasoning room for stock returned from the glue room.

Other machines in this department might include double cut-off saws for sizing the veneered stock, a three-drum sander and two belt sanders for finishing the material before it passes along for succeeding operations. Two other pieces of equipment, which might be used to advantage, are a veneer jointer and a veneer taping machine for handling the face stock and cross banding before it is glued. This equipment is all that is required for a plant using up to 10,000 square feet of three-ply stock per day. Where veneer is used for the cores or centres, if lumber cores are used, then the equipment must be enlarged upon and the following machines will be found necessary to convert the lumber into staves or built-up cores:—Rip saw, cut-off saw, glue jointer, surfacer, sander and proper gluing clamps. In many plants most of the woodworking equipment mentioned will be found in the machine department, although a number of sanders might well be included in the veneer room.

The glue room or veneering department is even assuming greater importance, due to the increased use of veneers and also because of the fact that modern veneer room equipment has resulted in increased output and lowered cost. For this reason it is well for every furniture manufacturer to give a little more thought and attention to this department and see if he can not make a few desirable changes which will tend to bring this department up-to-date. Probably the most important phase of the veneering operation and the one that is most often overlooked has to do with the drying of the veneer and crossbanding. If your veneer room equipment is weak in this respect it is certainly worthy of a little investigation and study.

Drying Plywood to Cut Finishing Costs

Thoroughly Dry Veneered Work Takes Smoother Finish, Reducing Finishing Costs—Special Drying Equipment Advisable—Even Circulation of Prime Importance—Temperatures and Humidities to Carry

By C. A. Cutler*

A single thin coat of varnish on glass will rub to a perfect surface because it is spread on a smooth level surface. The necessity for several coats of varnish on wooden surfaces is due principally, to the irregularity of the surface and much time, labor and material could be saved if greater care was taken in the preparation of the surface. In other words, more care given to the sanding will make a great saving in the finishing coat. Good sanding should produce a level even surface and all the open pores of the wood should be free from sand-paper dust. Filler will not fill or hold up if laid on top of fine wood dust that changes its volume with each change of weather.

Sanding is an operation, the quality of which varies directly as the quantity of moisture contained in the wood being sanded. Very dry panel work will sand cleaner in less time and with less cost of paper than the panel with more moisture in it. The moisture in the panel causes the wood fibre to be soft and they do not cut off clean as when dry. The wood dust from damp wood will pack into the pores when dry dust would be carried away by the air following the sand belt. If the panel is not dry when sanded the loss of this moisture at some later time will cause a shrinkage that will make the surface wavy and irregular.

Special Drying Room Essential

Now granted that the panels ought to be very dry when sanded then the problem is how to get them into that condition. The quickest and simplest way of course is to put them into a dry room. The length of time from their release from the retaining clamps to their placement in the dry room will depend upon the kind of glue used. A perfectly safe rule would be to pile them open with cleats placed carefully one directly over the other and let the pile stand in an open room at least twenty-four hours. This tends to straighten them out while they are still flexible so that when dried they will remain straight.

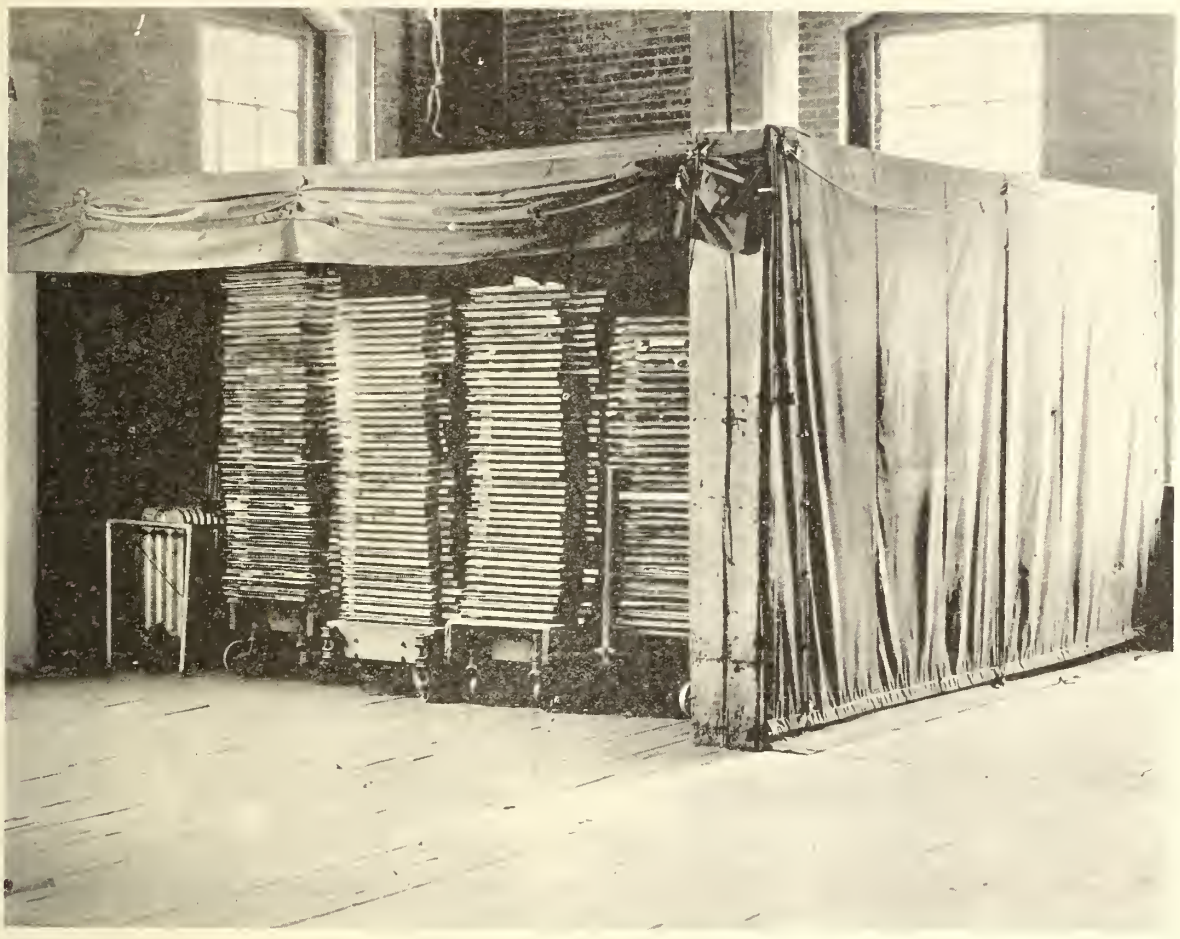
The treatment of the panels in the dry room will depend upon the kind of dry room. If the room is so constructed that the temperature, top and bottom, is substantially the same and the air circulation is such that it will pass through the panels at a reasonable speed, then a temperature of 120 degrees and a relative humidity of 45% will dry the panels in fourteen hours, or over night, so that they would be in good condition for sanding.

Even Circulation Required

In dry rooms where the heat rises directly up through the kiln it is very difficult to get any circulation between the panels and, therefore, the edges of the panel dry first and this causes a great deal of trouble on account of warping and even sometimes splitting. With this kind of dry room a temperature of 90 degrees would be better but, of course, the length of time to dry would be much longer.

The panels might have been piled on edge so that the air currents would pass through them but, this would also result in warping as the lower edge would dry first and those at the bottom of the kiln would receive a more rapid drying than those above them.

*President, Cutler Desk Co., Rochester, N.Y.



Showing panels being dried in special kiln

The best way is to provide for a circulation that moves across the kiln room.

A blast or a blower is not proper for this kind of work, because it will pile up and eddy around the piles instead of going through them. A steady, constant breeze over the whole room will find its way into every layer and will result in even drying that is controlled by the temperature of the room. The placement of the piles in the room is of importance. The cleats between panels must always be in the line of current and not across it and in all cases there ought to be free air space between the bottom of the pile and the floor of, at least, eighteen inches. It is surprising how the allowance of this free air space will improve the drying even in an improperly built dry room.

When Face and Back are Different

With a proper current the drying of panels with faces of one wood and backs of another can be provided for by using different thickness cleats. In the case of Quartered Oak faces and Poplar or Gum backs, the faces should be towards each other with 13/16″ cleats between them and the backs together with 3/8″ cleats between them. This prevents the backs from drying before the faces as they would do if the drying conditions were the same on both sides.

It is extremely necessary that the core stock should be extremely dry before pressing. The moisture from the glue next to the core must be taken up largely by this core itself before the glue will set, but this same moisture must come out again through two layers of glue and two layers of wood in the case of five-ply. This drying of core moisture is extremely slow and goes on for several months under ordinary shop conditions.

The moisture that can be rapidly dried out of five-ply stock is largely that moisture that has been introduced into the faces, backs and cross-bands in the process of gluing. This accounts for the fact that there is very little difference in the drying time between thick and thin panels.

Should Condition Gradually

The placement of panels in the dry room before the glue has thoroughly set sometimes causes trouble and this is the reason that twenty-four hours are allowed after release from the clamps. The dry room should be loaded before the steam is turned on so that the temperature of the panels is raised slowly and more evenly than would be the case if the room was hot when the panels went into it.

A large percentage of the dry rooms used for panel drying are very unsuited for this purpose. It is quite obvious that drying conditions ought to be near the same in all parts of the room. The drying conditions are dependent upon the heat humidity of the air in the room. The simple test of feeling with the hand the temperature of the surface of a panel at the bottom of the pile and another at a height of about six

feet from the floor, will surprise most kiln operators. They will find a difference that is so great that they will need no other proof that the room is not properly built. The drying speed is either too slow at the bottom or too severe at the top and it is certain that the top and bottom panels will not be equally dried.

When the dry room of this kind is operated at any given temperature and humidity it means that the air at the level of the thermometer only, is at that temperature and humidity. The air above this particular level is hotter and dryer and the air lower is colder and wetter. A difference of 95 degrees and humidity of 75% will have about half the drying speed of a temperature of 130 degrees and 35% humidity, yet these two conditions are often found at the top and bottoms of kilns that are supposed to be operated at 120 degrees and 45% humidity.

Necessity for Uniform Conditions

There is very little difficulty in drying panel stock if the dry room is built correctly to maintain even temperature in all parts and a circulation of sufficient speed. Home-made dry rooms, and even those put in by engineering concerns, are often without these two very necessary features and the operator is at a loss to determine what is best because panels taken from the same pile and supposedly treated all the same will show extremes of too little drying and too much drying. If the dry room was operated one time at 95 degrees and 75% humidity and the next time at 130 degrees and 35% humidity no one would expect very good results. Neither can good results be expected when these two sets of conditions exist at the same time.

No well operated factory can afford to wait for panel stock to dry in the natural course of events although it is difficult to convince some plant managers of this, but if they knew that ever so often a lot of panels become so badly stained that they cannot be used for regular color and that this staining was due to slow drying, they could quickly figure how a good dry room would pay for itself in a short time.

The shortening of any process has the following values. Reduction of stock necessary for a given production. Increase of production or saving in floor space. Less time between the order and the actual production of the piece. Closer relation between actual sales and production orders. Closer adherence to production orders because of definite knowledge just how long a time is required to produce a given piece. Better quality of production because the best possible conditions can be determined and maintained. These conditions being known as the planning department is not dependent upon a department foreman for information as to availability of stock ordered into process at any given date.

Making "Lamatco" Cottonwood Panels

Plant at New Westminster, B. C. Has Developed Production to High Degree—Sanders in Tandem Take Care of Sanding—Material Used Extensively in Building Industry

By G. S. Perry, Vancouver Editor

Using cottonwood as the raw material, Laminated Materials Co., Ltd., of New Westminster, B. C., is manufacturing plywood panels on an extensive scale, for use in many branches of building. Cottonwood is indigenous to the valleys of most of the British Columbia rivers and on the Coast it grows to large proportions. In the Fraser valley, there is a sufficient quantity of this timber to ensure supply for years to come. Its rapid growth points to possibilities of replacement as the supply is cut off. Making plywood panels on an extensive scale, the company at New Westminster has developed and patented a process, portions of which are of course trade secrets.

ALGOMA *the Better* Plywood

Circassian Walnut! It's been like opening a Captain Kidd treasure chest to cut these rare logs at Algoma—like lifting the lid on precious gems to see the surpassing beauty of graining opened before our eyes.

Frankly, these logs have exceeded even our hopes and expectations—they will surpass yours. Circassian Walnut has been off the market since 1914. However, the quality of the logs we are now cutting amply rewards us for the seven long years we have waited.

We take justifiable pride in having secured this shipment from far Caucasus—and the finest skill of our workmen is called upon to bring out the fullest matching possibilities of this supreme wood.

Circassian Walnut panels—Algoma made—are ready for you in any size you wish to order.

ALGOMA PANEL COMPANY, *Algoma, Wis.*

How "Lamatco" Panels are Made

(Continued form page 144)

the plant is arranged for speedy and continuous handling of the material. The logs are brought to the 9-foot lathe on an overhead conveyor, having been received at the plant both by rail and water from the woods. The lathe which strips the laminations is similar to an ordinary veneer lathe and the cutting is of course done to uniform thickness—i.e. for ⅛ three-ply panels the veneer is cut 17 to the inch; for 3/16 panels, it is cut 12 to the inch; and for ¼ panels it is cut 8 to the inch. Similar standards are adopted for the five-ply and other thicknesses.

Outline of Operations

As the veneer passes from the lathe on a roller system it is clipped to size and passed to tables where the laminations are assembled and the cement, which is a special preparation, is spread on the layers. The panels, for they now assume that shape, pass next to the hot plate presses where both heat and pressure are applied to unite the layers firmly and permanently.

The panels as they are taken from the hot plate presses go through a special drier, in which the process of removing all moisture is completed. The dried panels go then to the trim saws, the first set trimming the sides, and the second, or cut-off saws, bringing the panels to uniform length. The standard size adopted in producing these cottonwood Lamatco panels, as they are now called, is 42 x 66 inches. The 3-ply and 5-ply are the standard stocks made, though for trunk-makers and other special requirements the laminations can be built up to any desired thickness.

After being trimmed to standard size, the panels are put through two 48-in. Yates sanders in tandem. One side is sanded in the first and an operator stationed between the two machines turns each panel before it is fed into the second sander. After sanding the panels they next come into the hands of the grader, who grades them according to four standards established for the product. Every panel is then fine sanded on one side in a third Yates sander. This is the final process and it leaves the wood with a surface so smooth that little or no hand sanding is required for the highest grade finishes. The finished panels are bundled in standard packages 3 in. deep, containing different numbers of sheets according to the thickness of the panels. The bundles weigh approximately 130 lbs. and in this form they are shipped out.

Pressure in the hot presses so densifies the cottonwood that the finishing process on the dried panels makes a perfect surface for the reception of any finish. In use it is found that the wood takes any stain and finish readily and the grain comes out in various pleasing effects. For that reason it is finished to reproduce any hardwood surface desired, where panels of the actual hardwood would exceed cost limits. In this way a very wide range of uses is opening for this material. For door panels, trunks, etc., the five-ply is used, and more laminations as specified in special orders. Possibly the most extensive field opening for this plywood product is for panelling and house lining where ordinarily composition wall-boards have been used. The strength and durability of Lamatco product as well as the waterproof character of the cement used in making it, make it a permanent, not a temporary material where used. Naturally the better grades are used where fine finish is demanded, as for instance in the interior wood of steamers, for which it has been largely used on the Pacific Coast. In war-time the product of the New Westminster plant was shipped to England and largely used in aeroplane construction and other munition work.

With a present capacity of close to 50,000 feet per day, capable of expansion as the market demands, the plant is kept busy at all seasons.

Furniture Jobbers in Canada

Chicago, Ill., 531 Monadnock Building,
Feb. 13, 1922.

Editor, "Canadian Woodworker."

We have an inquiry from one of our members, asking for the names of furniture jobbers in Canada who might be interested in a high-grade line of fancy chairs. If you can give us the names of any such firms, your kindness will be appreciated.

Sincerely yours,
National Association of Chair Manufacturers.

There are not many large jobbing houses in Canada specializing in furniture. In the West there are a few which cater largely to what might be termed a local trade. It is just possible some of the following might be interested in your proposition:—D. V. Cope, Calgary, Alta.; Blowin Henry & Co., Edmonton, Alta.; Potter, Limited, Winnipeg, Man.; Morelock & Co., Vancouver, B. C.; W. Cline, Vancouver, B. C.; P. F. Legare, Limited, Quebec, and W. J. Craig, 215 Victoria St., Toronto, Ont.

Rotary cut cottonwood shows very attractive figure

This Rim Will Eliminate Table Top Troubles

?

THE vexing question of warping or checking is successfully overcome when this Rimbound Table Top is used.

The bent rim is a component part of the table top, and in addition to preventing the slightest moisture from entering the edge of the table, holds the entire top rigid and thus adds many years to its life.

And it not only protects the edge of the table, but provides for a perfect finish as well.

Made for period styles in Oak, Mahogany and American Walnut.

We guarantee this top free from mechanical imperfections and should any prove defective within six months, will replace free of charge.

Note the 1¼ inch rim for Period Tops. It makes a beautiful smooth, practical edge. No end wood to absorb moisture.

We can also supply your requirements in four and five ply table rims and panels, 3 and 5 ply, in all woods.
Mahogany and Walnut, Quartered Oak Veneers and plain rotary Veneers always in stock.

Panels, Limited - Southampton, Ont.

(Operated by Toronto Veneer Co. Ltd., Toronto)

Are You Using Hydraulic Presses?

The hand screw veneer presses and even the power screw machines are being gradually replaced by the hydraulic type of veneer press. One by one more up-to-date plants seem to be turning to the latter class of equipment.

Talking with the foreman of the veneer room of a large furniture factory, the "Canadian Woodworker" asked him why he had put out the old presses and installed a modern hydraulic one. His answer was enlightening and may prove of interest to other readers. "The chief reason why I recommend this machine is that it is the only type of press on the market which tells just how much pressure to suit the stock, and for this one reason alone consider the hydraulic press, equipped with pressure gauge, an absolute necessity. Another feature is that when the amount of pressure being applied is known, the same pressure may be applied to different press loads of the same class of work. The feature of increased production must not be overlooked for with this type of machine I find we can turn out far more work with less effort. One other point I would make is that with the hydraulic press the pressure application is even over all parts of the load, whereas with the multiple screw hand press one screw might be turned down much tighter than the other. I have not touched on the labor involved, for it goes without saying that the hydraulic press can be handled with fewer men and with less labor."

C. L. Willey Company Reorganize

The following letter from A. N. Cordell, president and treasurer of the C. L. Willey Company, Chicago, regarding the re-organization of this company, should prove of interest to buyers and users of hardwood lumber and veneers:

"For the purpose of going on record in the matter of facts pertaining to this company, we are addressing you the following statement regarding the C. L. Willey Company and plans for the aggressive carrying on of this business along lines which will perpetuate the policies of quality manufacture and ethical dealings which have always characterized the organization. While we realize this statement at current date is not strictly news, it is our belief that both the producing and buying trades will be interested in securing the true facts regarding the C. L. Willey Company because of the important position its name has always held in the industry. This statement has not been issued before because there were several points which were not until now ready for publication.

The present personnel of the C. L. Willey Company consists of A. N. Cordell, a close personal friend of Charles B. Willey, son of C. L. Willey, and a former official of the First National Bank of Chicago, president and treasurer; H. B. McClain, who has been associated with the company for many years, vice-president and production manager, and Mrs. Charles B. Willey, chairman of the board of directors.

Thus the Willey name will continue in active association in the business. Mrs. Charles B. Willey for some time before the death of her husband was in close touch with the business and after his death became actively interested. She is a woman of remarkable business acumen and her presence in this official capacity is further assurance that the quality policy of the company will be carried on. We wish to emphasize that this re-organization was effected on the soundest possible line, the company facing the future in splendid condition both as to organization and finances.

Scrupulous attention will be devoted to carrying on the business in conformity to the practices of its founder, who with two generations of lumbermen behind him and an intensive personal experience, founded this business at Chicago in 1890.

The establishment of the Chicago business thirty-two years ago was followed by rapid development in the purchase of foreign and domestic cabinet woods and their conversion into the highest type of finished product, the plant ultimately attaining a veneer cutting capacity of 100,000,000 feet annually with veneer drying equipment for 200,000 feet daily. Mr. Willey very soon came to be recognized as a man of almost magic judgment of logs and how to best cut them.

Mr. Willey's greatest achievement was the building up of an organization, which is substantially intact, for the selection of logs and veneer cutting. So thoroughly were they schooled in his methods that Willey Veneers to-day retain the same high standard of quality.

We will very much appreciate such space as you can give to the above announcement.

(Signed) C. L. Willey Company,
A. N. Cordell, President.

Temperatures for Veneer Drying Room

At the meeting for superintendents held in connection with the annual meeting of the Furniture Manufacturers' Association, the question,—"What is the correct temperature for the kiln for drying veneered work and panels?" was asked. This phase of veneered work has been investigated thoroughly by the Forest Products Laboratory at Madison, Wisconsin. They advise a temperature not in excess of 120 degrees F. Up to this it is quite safe, but over this when animal glues are used, there is a danger of the glue joint giving way. The "Canadian Woodworker" has been in numerous plants in which special panel-drying kilns are found. As a rule the temperature carried varies from 110 to 120.

Someone may raise the question of humidity. When using animal glues it would appear as if dry heat would have less effect on the glue joint than moist heat. If this is true, it would appear as if the humidity should be kept as low as possible when stock glued with animal glue is going through.

In the modern veneer-drying kiln, the circulation is usually forced and the humidity and temperature are under rigid control, often automatic. However, there seem to be many small kilns in operation which are giving satisfactory results and in which no attempt is made to introduce or control the humidity.

It should be understood that sanding belts have a speed which gives the best results. Too fast a speed spoils the cutting edge of the glass or garnet; too slow a speed means waste of time and machinery.

A good many broom handles are being put on the market in a very rough condition. Remember, there are machines especially made for sanding broom handles. Get one, and you will get repeat orders.

Are You Spraying Shellac, Stain and Filler?

(Continued from page 135)

an atomization pressure causes the almost total evaporation of solvent and leaves on the surface only the gum in a granulated form. A small nozzle is never to be recommended. In coating flat surfaces lying horizontally, it has been found best practice to start spraying from side nearest to operator and always working toward the unfinished surface. Thus air is being blown over the uncoated surface and is not retarding the flowing of the material on the coated portion.

How to insure best spray finishing results may be summarized as follows: 1. Have air free from oil and water. 2. Have clean surface, clean finishing room and clean equipment. 3. Never use excess atomization pressure. 4. Stay within a 6 to 8 inch working range. Do not hold spray several feet from surface to be coated. 5. Use the small, round concentrated spray on small narrow surfaces, and the wider fan-like spray only on the large areas. 6. Use heated air when spraying varnishes and enamels, as well as heated material. 7. Avoid waste and delay by using wherever possible the pressure feed material container in place of gravity feed type. 8. Handle spray systematically, in coating the surface same as would be the procedure if brushing.

If above cautions are followed no trouble will be experienced in the spray application of any materials used in furniture finishing. The saving found in application of varnish is also effected in the application of stains, fillers, shellac, enamels and lacquers. What has been found profitable in one case, will be found equally profitable in other cases. Leading manufacturers have many times been repaid for their spray equipment installations, and as expressed by many, "it would be suicidal to return to the old hand brush method."

Development of Walnut Finishes

(Continued from page 136)

shade difference between different manufacturers employing either or both of these characteristic colors.

Where there is sap wood, best results are secured with a double staining operation. The sap is first treated, a very effective method being with vinegar and raw or burnt umber, according to the shade desired. The next day, the final stained effect is produced over all.

In cases where a beautiful, rich natural effect is desired which incidently is very durable and capable of development with age, excellent results have been secured by dipping the wood in the white, in a mixture of three parts turpentine and 1 part China Wood Oil. When dry, fill and varnish.

When it is possible, walnut finish should always be double filled, and a swab coat of very thin shellac is often desirable. This gives the foundation for an ideal varnish finish.

Walnut is a wood which lends itself admirably to dull rubbed varnish effects, but walnut and also the stained mahogany require a different character of varnish to that commonly used on the red mahogany finishes.

The varnishes should be pale and light bodied. Otherwise, when the finish is viewed so as to "look into the pores" it will show an incongruous green. The brown accentuates the tendency of the black filled pores and dark yellow varnish to produce green, which the red partially neutralize.

To secure the real beauty of a walnut finish, the varnish must not only be pale and light bodied enough to give the knitting of coats desirable and possible, but it must contain a hard gum base so that it may be rubbed a smooth satiny finish.

The secret of fine walnut finish is to give the impression of a soft, smooth, wood-like surface with no apparent varnish. Too heavy an application of varnish is to be carefully avoided.

Varnishes with the proper gum base and color will be found to dry slower than the old type of varnishes, but this will not cause serious inconvenience in air dry schedules, and none at all with forced drying. Their tardiness is more in initial drying than in eventual hardening.

Amalgamation of Well-known Hardwood Manufacturers

On the 18th day of January one of the most important amalgamations in the export and domestic hardwood trade took place. The properties of the Darnell-Love Lumber Company of Leland, Mississippi, operating a slack cooperage plant near Leland, Mississippi, and Russe & Burgess, Incorporated, operating one of the most up-to-date band mills in Memphis (all of these plants are in active operation) was taken over by the Turner-Farber-Love Company.

The new company has a paid-in capital of $1,200,000. The personnel of the Turner-Farber-Love Co., is as follows: F. T. Turner, President, G. A. Farber, First Vice-President, European Manager, Headquarters London office, H. D. Love, Second Vice-President, General Manager Headquarters Memphis, R. W. Ricketts, Third Vice-President, Manager Leland Mills, F. G. Woods, Treasurer, Manager Foreign Sales Department Memphis, E. C. Gause, Secretary, Manager Tohula, Miss., Mill, H. Johannsen, Assistant Secretary, Manager General Offices, Memphis, G. W. Harris, Assistant Secretary, Manager of Office, Leland, C. W. Parham, Sales Manager, Headqnarters, Memphis, W. F. Little, Manager Cooperage Department, Headquarters, Leland, Mississippi.

A fourth band mill will shortly be installed to operate a 6,000 acre tract of virgin hardwood timber in Mississippi owned by the company. This will give the T. F. L. Company four band mills with 20,000 acres of virgin hardwood timber untouched, besides stumpage rights of many millions of feet, including forty million of the famous Pantherburn Cypress.

The Leland Stave & Lumber Company, which is part of the new company, operates a slack cooperage mill near Leland, Mississippi, has an annual capacity of 15,000,000 staves. Mr W. F. Little, manager of the cooperage department is an expert in this line, having formerly been with the Ozark Cooperage Company of St. Louis and has entire charge of the management of the cooperage department.

F. T. Turner, the president, is one of the best known lumbermen in the hardwood trade with a practical knowledge of all departments, having made together with Mr. Love and other members of the firm, a huge success of the Darnell-Love Lumber Company of Leland, Mississippi, of which he was president and Mr. Love, vice-president.

Have You Met This Year's Lumber Needs?

The turn of the year has developed a more cleancut picture of hardwood supplies. In the matter of production natural causes are now fully in force in retarding output. What natural causes will not accomplish will be insisted upon by the bankers. Production is definitely prescribed and can not be expanded before spring.

Consumption shows improvement, developing increasing call on already much overstrained stocks. Anderson-Tully's Seventy Million Feet of annual Hardwood Production and the varied nature of its operation have fortunately made it possible to keep our stocks well rounded out. This stock runs in quartered and plain oak, gum and other Southern woods in lumber and veneers and is sold under our consistent high standards of quality and services.

We shall be pleased to help any buyer cover his season's needs.

Anderson-Tully Company

Memphis, Tenn.

ATCo (MEMPHIS) SOUTHERN HARDWOOD LUMBER & VENEER

What's Your Opinion of Double Miter Saw?

(Continued from page 126)

one not so productive, the table is raised by stepping on a treddle.

Other uses might be cited such as mitering the straight pieces for table rims, cutting miter blocks for table frames where K.D. construction is used, cutting the rims for mirror frames on case goods, especially where oval tops and odd shapes are required and many other forms of ordinary work. In one chair factory, they cut back posts for chairs among other items. These posts are cut three at a time, both ends at once, the first day the machine was operated on this kind of work a comparatively green operator trebled the production of back posts over any other method they had been able to devise.

What Manufacturers Say

It may be of interest to read what a number of users have to say. One manufacturer says,—"We are using two medium double miter saws and find them entirely satisfactory. They are both being used on all kinds of square and miter trimming, on stock as short as 9 inches and up to capacity of the machine. We find that one of these saws will do the work of three of our other trim saws on both square and miter trimmings." A manufacturer of refrigerators remarks,—"We have found this saw to be a great time-saver. Formerly we were cutting thousands of miters every day on an old-fashioned machine, and find that our new double miter cut-off saw will turn out at least three times as much work and do it very accurately."

In addition to furniture and casket work this type of machine is also widely used in automobile body plants, where it has been found indispensable in cutting floor boards and many odd shaped parts of the bodies, both ends at once.

What to do to Sit at Boss's Desk

(Continued from 121)

small tools, the purchasing is much less vital. There the materials represent a smaller fraction of the final cost of the product. Labor and manufacturing ability are more important factors.

"So our counsel to men is: 'Analyze the business analyze the people around you, analyze yourself. In the long run, get into a department where profits are produced, or in which for some other reason the chief executives are most interested; avoid the departments which are merely routine, with little or no chance either to make or to save money, and thereby to increase profits.'

Learn to Think, Speak and Write

Among the many other factors that influence men's progress there are two that seem to me especially worth remembering," Dean Donham went on. "The young man in the minor executive job will often be requested by his superior to make reports and recommendations. What an advantage the man enjoys who can express his thoughts clearly, briefly, and convincingly. Every man who seeks to be an executive should cultivate the power to use words effectively in writing.

"One excellent plan for improving business English is to try putting the essential facts of some business problem, that has come up in the course of the day's work, into two hundred words. Lincoln's Gettysburg address is less than three hundred words long; yet many a man dictates more words than that in requisitioning a supply of stationery from the stockroom.

"A second fact worth remembering is that the clean-cuff jobs by no means have a monopoly of opportunity in modern business. Young men, and college men especially, tend too exclusively to look for the desk positions, where they never come in contact with the man on the machine. Yet the job in the plant is often more interesting and quite as productive. For example, the labor problem of the manufacturer is almost surely the storm center of business for the next generation. Can anything be more interesting to the man who has the ability to manage men? Employers frequently tell me of men who miss the big chances in their industries by being unwilling to take night shifts, or to do disagreeable work, or by failing to see the opportunity offered by some minor position.

A Price Must be Paid

Many years ago in a course in Finance at Harvard, Professor Dunbar, who perhaps did more than any other American to develop the theory and science of banking in this country, remarked that there is only one correct rule of finance, and that is to do the best thing you can—under the circumstances. All rules for being an executive are summed up in that one bit of shrewd common sense. Every man in an organization, except the boss, has somewhere to turn for decisions. He has no court of last resort except his own mind and will. He must do the best thing he can under the circumstances. No matter how much help he has, he must weigh the evidence, make the choice, and accept the responsibility for the result.

"The mahogany desk, a good home, a wide variety of comforts are the rewards of his job; but the price is the hardest thing in the world—thinking and acting, making up his mind and then going ahead. No man gets the boss's job who does not begin, even in the ranks, to make some payment every day on the purchase price."

Book on Plywood and Glue

Although originally intended for the aircraft inudstry, "The Manufacture and Use of Plywood and Glue" by B. C. Boulton, B. Sc., is so complete as to be of interest to all users of veneers and plywood. The subject is treated in five chapters as follows:—Manufacture of Veneer and Plywood, General Properties and Use of Plywood, Plywood Strength Tables, Design of Aeroplane Parts of Plywood, and Manufacture and Use of Glues. The chapter on glues treats with the manufacture and use of glues in an exhaustive manner, dealing with such adhesives as animal glue, egg and blood albumen, casein, casein glues, testing glue and relative merits of different glues. Copies of this book may be secured from Sir Isaac Pitman & Sons, Limited, 70 Bond St., Toronto. Price $2.25.

The dado head consists of two outside saws for cutting the grain of the wood. These are very fine tooth saws. The interior between the two outside ones is made up of other saws shaped to make easy ripping.

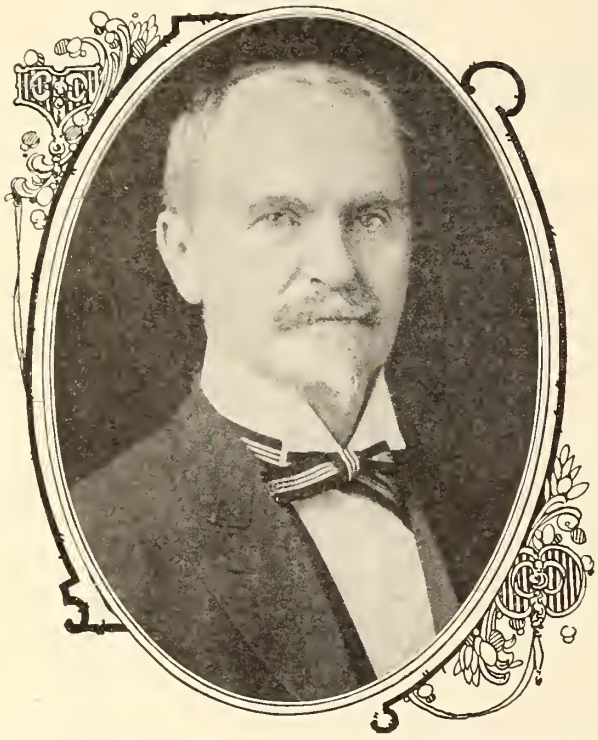
President J. A. Fay & Egan Co., Passes

Announcement has just been received of the death of Thomas P. Egan, aged 74 years, president of J. A. Fay & Egan Co., Cincinnati, Ohio, manufacturers of the "Lightning" Line Woodworking Machinery. Thomas Patrick Egan was a resident of Cincinnati, nearly all his business life. He was born. Nov. 20, 1847, in Limerick, Ireland, and when an infant was brought by his parents to Hamilton, Ontario. As a boy, after leaving school, he was in the employ of dry goods houses in Hamilton and then in Detroit, but when 16 years old his mechanical bent led him to Cincinnati, where he secured a position in a machine shop. After a few months he changed to the firm of



Thos. P. Egan, late president, J. A. Fay & Egan Co., Cincinnati, Ohio.

Steptoe, McFarlan & Co., which at that time was one of the heaviest manufacturers of woodworking machinery in the United States. He remained with them 12 years. Early in his employment with this firm he had the misfortune to lose an arm. Up to that time he had been engaged in the manual processes of the shop, but the accident sent him into the office where he studied bookkeeping and the technique of the business, which started him on his career of inventor, manager and employer.

In 1874 he decided to begin business on his own account and with two partners opened a little shop, where at first the partners constituted the entire force. Seven years afterward, however, in1881, the Egan Co., was incorporated with a capital of $150,000 with Thomas P. Egan, as its president. This enterprise was successful from the first. It was located across the street from the establishment of J.A. Fay & Co., then the most important woodworking machinery establishment in the country, and of which it became a rival. The commercial battle was a warm one, and finally resulted in the consolidation of the two companies in 1893 under the style of the J. A. Fay & Egan Co., of which also Mr. Egan was president. While busily engaged with the multitudinous affairs of his own business, Mr. Egan showed the spirit of a good citizen and was always ready to do his share in any movement for the advancement of the city of his industry or the country.

System Foundation of Economical Production

(Continued from page 94)

given. In the varnishing section the use of movable drying racks have been found of great value in saving time and labor. These racks are fitted with ball bearing castors. In the first instance the racks are taken empty to the spraying machine. The various pieces are sprayed and placed on the racks, where they are left to dry. When a second coat is required, the full racks are wheeled to the machine, sprayed, and again left to dry on the racks. The racks will take bed or toilet frames and buffet backs. Platforms on ball bearing castors are used for drying and conveying dining table tops.

The surface oak furniture is stored in warehouses on the ground floor, while the better class of goods are kept in a store-room, on the second floor. The shipping room and store-room for various supplies are on the ground floor. The former opens right on to a Grand Trunk siding, so that furniture is loaded direct into the cars. On the same floor is a store-room for such small parts as mirror frames, bureau backs, and sideboard backs. A small dry kiln for bending rims to be used in round extension tables is on the ground floor.

The plant is operated by steam. One of the boilers, of 150 h.p., is by the Waterous Engine Works Company, Limited, Brantford, and the other of 90 h.p. by the Jenckes Machine Company, Sherbrooke. The boilers are fed by shavings and refuse, which are collected by means of the exhaust system of Sheldons, Limited, Galt, and conveyed direct to the boilers. The engine is of the Wheelock type, supplied by a Fairbanks-Morse dynamo and a 20 h. p. engine are installed.

The general offices together with the office of the superintendent are on the ground floor.

The superintendent is Albert Hudson, an old contributor to the "Canadian Woodworker and Furniture Manufacturer."

"Play the Game Hard but Play the Game Fair"

(Continued from page 90)

"Good Furniture Magazine," Grand Rapids, Mich., gave an interesting and instructive address on "Publicity."

Upon the conclusion of Mr. Gronberg's address a resolution was passed that the members of the Furniture Manufacturers' Association endorse in principle the publicity campaign carried out by the Home Furnishings Bureau, and promised their moral and financial support to what extent they can possibly give it.

What of Hardwood Lumber Market?

Will Increase in Demand Mean Higher Prices?—Not Much Tendency Toward Increased Production—Prominent Lumbermen Outline Views

The lumber situation has undergone very little change since the first of the year. The volume of business offering to date may not have come up to the expectation of many hardwood lumber manufacturers who are looking for a marked increase in demand. Prices have shown very little variation, having apparently stabilized at present levels. In certain sections of the south production was pushed in anticipation of a better market. When this did not materialize, slight reductions were made to retard accumulation of stocks. Theseprice movements appeared to have been only local; in fact they are not reflected in the general level of values.

As it stands to-day, the upper grades above No. 2 Common are scarce, while there is an over-abundance of lower-grade stock. Production is low with little, if any, tendency toward higher output. The situation is one which will stand careful watching. When buying once starts, and the demand is bound to increase, prices on the better grades will reflect such renewed activity. The last week or ten days has shown a marked increase in the number of inquiries made and in shipments.

A number of hardwood operators who are in the closest possible touch with the general situation, have outlined their views for the readers of the "Canadian Woodworker and Furniture Manufacturer." These are as follows:—

Canadian Hardwoods

Edward Clark & Sons, Limited Toronto:— In our opinion the hardwood situation in Canada is rapidly improving. The liquidation process has been followed along carefully and there is now very little forced sale, as a consequence the market is much more stable. The weakest point to-day in the hardwood market is a considerable surplus of low grade lumber more particularly in one inch. The improvement in the furniture trade and evidence of a good building season have caused some considerable enquiry for this line of stock. We would say that if prices are maintained on a reasonable basis trade should rapidly improve and we are anticipating a fair year's business.

Ample Stocks of Walnut

Frank Purcell, Walnut Lumber Co., Kansas City, Kansas:—

The recent furniture exhibits at Grand Rapids and Chicago were attended with a fair degree of success, the amount of orders booked by furniture manufacturers being sufficient to insure uninterrupted operation of the factories for a number of months at least. The proporition of furniture sold in American Walnut was large, which would indicate a good consumption of this wood during the first half of 1922.

The prices being secured at this time for the lower grades of walnut are hardly sufficient to encourage a large production, but there is every indication that stabilized conditions would permit a sufficient advance in the lower grades to permit the manufacturer of lumber to secure a fair replacement cost for his production. In anticipation of this, production is being resumed by some of the larger mills, and there seems to be no reason to believe that there will not be an ample supply to permit of the proper selection by the buyers of furniture factories.

So far as this company is individually concerned, we do not find it difficult to dispose of our walnut lumber about as quickly as we have it in good dry condition for the furniture trade.

Northern Hardwoods

Bigelow-Cooper Co., Bay City, Mich:— "The spirit of conservation which has prevailed during the past two years continues to predominate with the consuming trade and therefore, the tendency to wait for the actual need of lumber is retarding sales. The curtailment in production during the last year has reduced stocks, especially in the higher grades to a very low point. These stocks cannot be replenished before the summer months when the new stock cut during the winter becomes dry. It is therefore, very likely that the anticipated demand for high grade hardwood during the next two or three months will cause a severe shortage which of course will affect values. We consider that the buyer who delays his purchases until pressed by his real needs will suffer,"

Stronger Demand for Mahogany

Freiburg Mahogany Co., Cincinnati, Ohio:—There is a tendency at this time for an increase in consumption of Mahogany lumber and veneer and while the process is slow, within the next six months there should be a marked improvement in demand. Prices to-day are very low on Mahogany taking into consideration the cost of logs at this time. There has been an increased cost to the manufacturer of logs for this coming season of at least 20%. There seems to be no doubt but that the prevailing prices will show some improvement.

We are very hopeful for 1922 and anticipate that by April or May conditions will bring sound and prices improved.

Flooring and Flooring Lumber

Seaman, Kent & Co., Limited, Toronto:— The general situation in hardwoods remains practically unchanged. Prices are holding their own with a few revisions upwards or downwards on special items. There is a super-abundance of stock of the lower ends in birch and maple for which a limited demand exists. In the upper grades there is no surplus stock whatever and millmen are disposed to hang on to what they possess unless they can get a fair figure for their holdings. The amount of hardwood taken out during the past winter shows a considerable falling off from a year ago but the consumption is by no means as great, therefore the supply and demand are more equally balanced.

In respect to hardwood flooring, shipments from our various plants since the first of the year have been considerably ahead of the corresponding period of 1921, and the outlook in gradually improving. Much, of course, will depend upon the building situation during the coming summer.

News of the Trade

The plant of the Independent Last Co., Montreal, was recently damaged by fire.

C. J. Townsend, Toronto, manufacturer and dealer in antique furniture, recently passed away.

Messrs. Baker & Redden, Windsor, N. S., are contemplating the erection of a sash and door factory.

Panels Limited, Southampton, Ont., contemplate installing a "Merit" hot plate re-dryer and a 42-inch planer.

The Bishopric Wall Board Co., Broad St., Ottawa, is erecting an addition to their factory at a cost of $15,000.

J. W. Hodgson, well known carriage manufacturer died recently at his home in Riviere Du Loup, Quebec.

William Finnegan, Belleville, Ont., carriage manufacturer and prominent citizen, died recently in his 65th year.

Warren, Spence, Niagara Falls, Ont., carriage and wagon manufacturer, recently passed away in his 75th year.

Ridpath Cabinet Co., Yonge St., Toronto, manufacturers of Art furniture, recently suffered a fire loss of $15,000.

Robert Stewart, Limited, Guelph, Ont., expect to have their new woodworking plant in operation some time in March.

H. T. Reid and James McLagan, Montreal, recently registered as Reid & McLagan to manufacture and market upholstered goods.

H. H. Marsh, who conducted a planing mill and lumber yard at Grimsby, Ont., recently died in the Hamilton General Hospital.

J. E. Burnett & Son, Alliston, Ont., manufacturers of phonograph cabinets, have called for tenders on their factory equipment.

The National Showcase Co., Limited, 578 Queen St. East, Toronto, are making some alterations and additions to their showroom.

The Hamilton Home Builders Limited, Hamilton, Ont., were recently incorporated to carry on a general contracting business; capital $500,000.

J. B. Mackenzie, woodworker and retail lumber dealer, Georgetown, Ont., has been re-elected chairman of the Board of Education of that town.

Ontario Casket & Supply Co., has been registered at Toronto and will locate at 331 Symington Ave. The partners are J. M. Arnold and W. J. Hubein.

The plant of Leggat & Platt Spring Bed & Mfg. Co., Windsor, Ont., was badly damaged by fire, loss $15,000. The factory will be rebuilt at once.

William McCown, formerly of Clinton, Ont., where he conducted a carriage factory for a number of years, recently died in Toronto in his 88th year.

The General Motors Corporation, Limited, Oshawa, Ont., recently installed a number of Preston woodworking machines in their plant at Oshawa.

The Montreal Wood Mosaic Flooring Co., Limited, 672 St. Catherine St. West, Montreal, is now being conducted by Howard A. Gardiner, as manager.

W. W. Avey, Norwich, Ont., contemplates a planing mill to cost $10,000. A by-law was carried recently granting a fixed assessment on this property.

The Grey Furniture Co., Limited, Neustadt, Ont., have undertaken the production of some new lines of furniture, viz., dining room chairs and library tables.

The Sussex St. woodworking plant of the Gatineau Co., Ottawa, formerly the property of W. C. Edwards & Co., has been closed down for an indefinite period.

W. P. Flint, Chicago, secretary of the Millwork Cost Bureau, was in Toronto recently and addressed a gathering of woodworkers at the King Edward Hotel.

The Canadian Match Co., Limited, Pembroke, Ont., which was incorporated about a year ago with a capital of $1,000,000, recently put their plant in operation.

Fletcher-Reis Brush Co., Limited, Toronto, have been incorporated with a capital of $60,000, and will manufacture brushes, brooms and other wooden products.

The Ontario Sanitary Kabinet Co., Limited, Toronto, were recently incorporated with wide powers to manufacture and deal in wood and iron. Capital $50,000.

Brunette Sawmills, Ltd., including a planing mill at Sapperton, B. C., near New Westminster, were completely destroyed by fire recently at a loss of $500,000.

T. H. Gillespie, Belleville, Ont., prominent citizen, died recently in his 83rd year. Deceased was a carriage maker before retiring from active life a few years ago.

The planing mill and sash and door factory of J. Hanbury & Co., Limited, Vancouver, B. C., which has been shut down for repairs, has been re-opened with a full force.

The H. & E. Furniture Co., Limited, Milverton, Ont., have placed an order with the Paasche Air Brush Co., of Chicago, for one unit of their spray finishing equipment.

Thomas Arnott, Orangeville, Ont., farm implement manufacturer, died recently in his 70th year. Deceased was prominent in public affairs serving as reeve and councillor.

Superior Furniture Co., Ltd., Norwood, Ont., were recently incorporated to manufacture and deal in furniture, toys, baby carriages and other wood products. Capital $40,000.

The St. Mary's Wood Specialty Co., Limited, St. Mary's, Ont., are in the market for 100,000 feet of rock elm logs, also for quantities of white ash, hickory and second-growth maple.

Jackson Cabinet Co., Limited, Durham, Ont., have been recently granted a provincial charter with a capital of $100,000 to manufacture and deal in cabinets and other articles of wood.

Wilson Motor Bodies, Limited, Toronto, have been incorporated to manufacture and deal in automobile bodies, flying boats, water craft and other wooden vehicles. Capital $100,000.

The Kootenay Match Co. is being organized with a capital of $150,000, to engage in the manufacture of matches. Patents on certain special new process machines are held. The registered address is Nelson, B. C.

John Hepner of the firm of Stevens-Hepner, Ltd.,

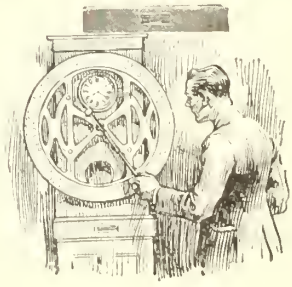
Modern Methods of Producing Furniture must FIRST begin with Modern Methods of Accurately recording the Labor Time you pay for

THIS issue of the Canadian Woodworker and Furniture Manufacturer is featuring modern methods of producing furniture. Up-to-date machinery for quantity and quality production—ideas for eliminating unnecessary operations—proper arrangements of machines and routing of work—and many other useful suggestions are outlined. They all tend toward increased production and lowering of operating costs.

But what about the methods you have adopted for keeping an accurate account of your labor time? Have you given this question the thought and consideration it should have? Labor time represents a large percentage of your manufacturing costs. You know exactly how much to charge up for raw materials—for operating expenses—overhead and depreciation of plant and equipment. Are you as thoroughly organized to say exactly what your labor has cost you? You cannot be absolutely sure unless you have a modern system of time recording.

Job Recorder

Card Recorder



Dial Recorder

INTERNATIONAL TIME RECORDERS and INTERNATIONAL JOB TIME RECORDERS

will give you this information accurately and legibly printed on convenient time sheets and cards, which are always at your disposal for reference. They enable you to estimate the exact cost of your labor and —even more important—they show you the difference between purchased labor and productive labor, a difference which represents a dead loss.

INTERNATIONALS are made in 260 models, either electrically operated or spring driven and adapted to all lines of business. We are the only manufacturers in the world who can offer a choice of every type time recorder—the Dial Type, the Card Type, the Job Type, The Autograph Type, the Self-Contained Type, the Electrically Driven Type.

Time Recorder Prices Are Back to Bed Rock

These reductions range from $10.00 to $85.00, according to style and type of instrument. Effective immediately.

May we show you how we can fill your requirements perfectly?

Port Elgin, Ont., died recently at the Wellesley Hospital, Toronto, in his 73rd year. The deceased was for many years engaged in the manufacture of brushes and brooms.

The Starr Company of Canada, Limited, London, Ont., are at present manufacturing and finishing their phonogarph cabinets in Canada. Formerly the cabinets were imported from the parent organization in the United States.

Thee Wallace Shipbuilding Co., North Vancouver, B. C., were the successful tenderers for repairs and alterations to the "Admiral Farragut." This contract was secured in the face of keen competition from American yards.

Alberts Furniture Co., Limited, Montreal, have been granted a federal charter to manufacture and deal in all kinds of furniture. Capital $250,000. P. Bercovitch and R. L. Calder, both of Montreal, are two of the incorporators.

It is rumored that the Canada Car & Foundry Co., Montreal, who recently turned out 200 cars for the Toronto Transportation Commission is considering the establishing of a plant in Toronto, owing to opportunities offering in that city.

The order for doors for the new Prince Edward Hotel at Windsor, Ont., which is to cost $1,000,000., has been given to the McLean Lumber Co., while Schultz Bros. & Co., Limited, of Brantford, have been given the order for the casings.

R. Chestnut & Sons, Fredericton, N. B., have had plans prepared for a new canoe factory to replace the one recently destroyed by fire, with an attendant loss of $75,000. Prices are wanted on the necessary equipment. New building will be 4 storeys, 100 ft. x 100 ft.

Layton Bros., Limited, Montreal, have been granted a federal charter to manufacture and deal in pianos, phonographs, music cabinets and other musical instruments. Capital $500,000. Two of the incorporators are P. E. Layton and G. Layton, both of Montreal.

Harris Record & Phonograph Co., Inc., Montreal, was recently granted a provincial charter to manufacture and deal in phonographs, cabinets, records and other accessories. Capital $700,000. J. G. Audette and P. L. Garneau, both of Montreal are two of the incorporators.

Canadian Show Case & Manufacturing Co., Ltd., Windsor, Ont., was recently organized to manufacture and deal in show cases, office fixtures and furniture. Capital $40,000. W. B. Craig, Windsor, Ont., and Ira Cohen of Highland Park, Mich., are two of the incorporators.

About 30,000 tons of box shooks have been shipped this year from Vancouver, B. C. to Singapore, and other parts on the other side of the Pacific. The shook business for 1922 looms large as several good sized orders are anticipated as a result of the success of last year's shipments.

The offices of L. L. Brown, B. C. Lumber Commissioner for Eastern Canada, has been moved from 1 Adelaide St. East, to 51 Yonge St. An interesting display of British Columbia forest products, including several rooms in full scale, finished in B. C. woods, will be found at the new location.

The Currie Manufacturing & Lumber Co., Limited, Brandon, Man., recently put in some new equipment and are now manufacturing a complete line of school equipment. A new line is being added in the shape of a patented moveable desk chair which they anticipate will meet with a strong demand.

The Port Hope Veneer & Lumber Co., Port Hope, Ont., are enjoying a very busy season, having plenty of work for their thirty employees. The splendid type of basket turned out by this plant last season, has won for them many new customers and the industry promises to become an important one.

The Bolt-on Sleigh & Carriage Co., Ltd., Winnipeg, Man., were recently incorporated to manufacture and deal in carriages, sleighs and to purchase the patent for a certain attachment for baby carriages. Capital $50,000. G. H. West, and R. N. Buckley, both of Saskatoon, Sask., are two of the incorporators.

O. J. Mitchell, Ingersoll, Ont., inventor and manufacturer of a combination hearse and casket is suing A. B. Grier & Son of London, Ont., for alleged infringement of patent. The inventor declares the London company is making a similar combination hearse and casket and marketing it at a ridiculously low price.

The Hanbury Mfg. Co., Limited, Brantford, Ont., have again put their plant into operation and are manufacturing boxes of all kinds, crates, shooks, cross arms and open sash. A considerable amount of new machinery has been installed and the plant is now up to date in every respect. At the present time about twenty hands are being employed.

F. Moss, Toronto, has been appointed Canadian representative for the Freiberg Mahogany Co., Cincinnati, Ohio. He is also handling a line of veneers made by the Guelph Patent Casket Co., Limited, Scotstown, P. Q. Mr. Moss is well-known to furniture manufacturers in Canada, having been proprietor of the Preston Furniture Co., Limited, for many years.

Harry Horsman, Crescent Rd., Toronto, who of late years has been head of the Nash Motor Sales in Toronto, passed away in his 63rd year. Deceased was at different times connected with several large industries having been manager for fourteen years of Frost & Wood, farm implement manufacturers. Later he was manager of the Dominion Carriage Company, Toronto.

The Imperial Rattan Co., Limited, Stratford, Ont., recently tendered a social evening to employees and their families. Dancing and cards were the order of the evening. An orchestra, composed entirely of employees provided the music. Refreshments were supplied by the Imperial Rattan Co. This is one of a number of social evenings which have been planned for the winter months.

The Government of Alberta is calling for tenders for the following items of furniture for the Technology Institute.—1. Seating equipment for thirty classrooms. 2. Complete library furniture and equipment. 3. Complete equipment for chemical and physical laboratories. 4. General office equipment and furniture. 5. Assembly hall seating equipment. Tenders are to be in on or before March 31st, 1922.

The article, entitled "The Science of Moisture Control," which appeared in the July issue of the "Canadian Woodworker and Furniture Manufacturer" has been reprinted and is now available for distribution. Copies of this article, which dealt with the subject of controlling moisture in lumber and veneers from a new angle, may be secured by writ-

Look for the brand—It's on every board

THE KRAETZER-CURED LUMBER CO.

Your Protection—Our Guarantee

Kraetzer Curing—What It Is

Kraetzer Curing is simply the modern and more efficient application of the treatment of wood relied upon by the artisans of the earlier periods in the construction of their master pieces of cabinet work. Even, now, after the elapse of centuries, we still frequently encounter such pieces in a perfect state of perservation.

This treatment is even more beneficial to Gumwood than to the woods employed in those earlier times. Kraetzer Curing immediately eliminates the sap and gelatinous substance in the wood. It also completely does away with fermentation and the resulting strain and decomposition, which by some is considered a necessary and deterring evil.

Likewise, Kraetzer Curing makes the sap portion of the wood more dependable than the Heart or Red Wood. It can then be used for practically all purposes with equal or greater satisfaction than Red (or Heart) Gum, Birch, Maple or other woods. It is available at materially lower prices.

Send for the Kraetzer-Cured Booklet, and write or wire for quotations.

The Kraetzer-Cured Lumber Co.

GENERAL OFFICE: GREENWOOD, MISS.

ing the Forest Products Engineering Co., Chicago.

The Kinnon Lumber Co., Limited, Toronto, was recently incorporated to manufacture and deal in Canadian and imported hardwoods. Offices have been opened at 454 King St. West, Toronto. The principals of this company are George Kinnon, who for many years was associated with the Wm. Laking Lumber Co., and G. D. Martin, of Burk's Falls. The new company have taken over the business recently carried on by George Kinnon.

James C. Miller, Owen Sound, Ont., recently passed away at his home in that city. Mr. Miller, who was in his 70th year, was well-known in the commercial life of Western Ontario, having for 53 years been connected with the woodworking firm of John Harrison & Sons Co., Limited. For the greater part of this time he acted as treasurer. He is survived by his wife and two sons, Victor, of Peace River district, and W. Harrison Miller, of the Phillips Mfg. Co., of Toronto.

Reports from London, England, state that out of three hundred plants manufacturing toys, eighty-two have closed down owing to German competition. An effort is being made by the British manufacturers, through the Safeguarding of Industries Act to secure an imposition of an extra custom duty of 33⅓ per cent ad valorem. The collapse of the exchange, it is held, gave the Germans an unfair advantage as compared with conditions which enabled British manufacturers to successfully compete in pre-war times.

A provincial charter has been granted to P. W. Gardiner & Son, Limited, Galt, Ont., to carry on business as dealers in and manufacturers of all kinds of lumber and wood products, and to carry on business as builders and contractors and to acquire the assets and goodwill of the partnership firm of P. W. Gardiner & Son, now carried on in Galt. The capital stock of the new company is $500,000 and among the incorporators are,—Peter W. Gardiner, James E. Gardiner, Gladstone W. Gardiner and Harold M. Gardiner.

The Canadian Car and Foundry Co., Montreal, held their annual meeting recently, all the old directors were re-elected, Senator Curry occupying the chair. President Butler speaking on trade conditions stated that despite the dull conditions of the times the company was in excellent condition. His outlook for the coming year was hopeful of better business as the transportation companies would have to replace their worn out equipment sooner or later and he thought it would be soon, if the railways were to give the service that was expected of them.

A chair to be known as the "Mrs. E. B. Eddy Chair of Industrial Chemistry," has been founded at McGill University. This was made possible through the bequest in the will of the late Mrs. Eddy. According to the plans for the new chair, the holders of the professorships will devote special attention to wood chemistry as the Eddy family has been concerned largely with forest products in Canada both in the lumbering and manufacturing ends of the industry. The development of the lumber and pulp and paper industries and the necessity for greater conservation of Canadian forest resources, has increased the demand for men trained in this field.

The Knight Mfg. & Lumber Co., Limited, Meaford, Ont., plan on engaging in the manufacture of doors on a more extensive scale. To this end the following equipment has been added:—Power door clamp; roller table cut-off saw; glue jointer, 15 spindle boring machine, two new presses, 44-inch glue spreader and a 12-inch glue spreader. Both the latter machines are run by small motors. In addition to having a new line of fir doors, they propose to go after the veneer door business more strongly. In a letter to the "Canadian Woodworker" they state,—"Our business has doubled in the past six months and we are looking ahead to better things in the spring."

The Cranbrook Sash & Door Co., Limited, Cranbrook, B. C., have completed their main factory building and the machinery is now being installed. The building itself is two storeys, 112 x 60 feet. The boiler room, dry kiln and lumber sheds are yet to be built, but the whole unit is expected to be in operation some time in March. The output will consist principally of sash and doors, the capacity of the plant being 500 sash and 200 doors per day. H. A. McCallum is the general manager, with W. P. Attridge, secretary-treasurer; J. H. Spence, vice-president, and Joseph Woodman, director. From 40 to 60 men will be employed. They expect to make an addition next year in the shape of a box factory to cater to the demand for fruit and butter boxes.

Which Way Do You File Band-saws?

It is a universal practice amongst saw-filers, when filing band-saws by hand, to file the front of a tooth before filing the face of the same tooth, with the object in view of throwing whatever burr there may be parallel with the face. It has been found in actual practice that any burr that may be left in this manner will break off in running in such a way as to leave the cutting edge sharp. Because of this feature, it is not feasible to properly file band saws on any filing machine which employs a pawl to advance the saw, because the file must necessarily cut the face of the tooth parallel with its angular side, and also the front of the tooth above it. As a pawl-fed machine employs the front of a tooth as a stop or rack, by which the saw itself is moved into position, it is obvious that the saw must move in a direction which prevents the file from coming in contact with a tooth after the front of the tooth is filed. In order to overcome this objectionable feature, the relation of the approach of the file and saw to each other, must be reversed; or in other words, if the file maintains its same position, the saw moves in a direction which would require the motive power to be applied against the face or angular side of the tooth. This, of course, is impractical with a pawl, but has been successfully accomplished by the principles employed in the Grip Feed Filing Machine, which was designed after hearing a good many complaints regarding saws filed on pawl-fed machines. The gripping device in this machine clamps rigidly against the side of the blade, and by a cam arrangement may be adjusted to feed uniformly the required length of tooth. The great demand for these machines clearly proves the satisfaction enjoyed by the users of the grip feed filing machine.

Hard work is the best way to take the stretch out of leather belting. Still it is rather expensive if a valuable machine has to be put out of action while a piece has to be taken out of the belt. A good belt which does not stretch has very big advantages.

Millwork Manufacturers' Association Meets

Sixty-two members from eleven States attended the quarterly meeting of the Southern Sash, Door & Millwork Manufacturers' Association which opened recently. President P. F. Conway, of Danville, Va., Presided. The feature of the day's session was the address by Secretary C. B. Harman, on "Trade Associations, the Government and the Public."

Tells Value of Association Work

After refuting baseless charges made against trade associations by those not familiar with the workings of such organizations, Mr. Harman proceeded to show the wide variety of constructive work carried on by an association such as that of the southern millwork men. "In reality," said he, "our association is nothing more nor less than a trade institute where we are teaching our members the things necessary for the successful conduct of their business," He enumerated some of these things, as follows:

How to construct their factories and to lay out their plants, wisely, economically and with the latest facilities.

What kind of machines to install, where to buy it, how best to place it and how to keep it in good condition.

When to scrap a machine and how to know when a machine is giving less service or efficiency than some other new type or make of machine.

When it is profitable to buy rather than to make certain material.

How best to keep and arrive at the true cost of buying, storing, handling and selling various kinds of material.

How best to standardize as regards sizes, quality, manufacture, packing and design.

How best to systematize their accounting, conserve stationery and conduct their office affairs by the largest and shortest methods.

When, where and how to advertise, and how to find new fields or wider territory.

How to ascertain whether they are making their material as cheaply as their competitors.

How to find whether their employees are giving them more or less efficiency than those of their competitors and whether their head men, such as superintendents, estimators, sales manager, and others, are as competent and reliable as similar employees of their competitors.

How to know what kind or raw material and supplies are best to use and where to get them.

How to take off lists of material from architects' drawings in the quickest, most correct manner.

How to prepare estimates with least risk of errors, what forms are legal, the most correct and desirable manner of listing, and how to perform this work quickly and in a way that may be plainly understood by everyone.

Mr. Harman also said that the association served as a clearing house for information and counsel along all lines relating to the millwork industry, a service that is extensively and continuously used by manufacturers all over the United States and Canada, both members and nonmembers.

"Restrict organization among manufacturers, limit the activities of trade associations and development will stop, new ideas will be scarce, the business of manufacturing will become sluggish, and the public will have to pay," said Mr. Harman in closing.

Assistant Manager J. L. Thompson, of the fabricated production department, United States Chamber of Commerce, delivered a talk on elimination of unnecessary items as a measure of efficiency and economy. Secretary-Manager J. E. Rhodes, spoke for the Southern Pine Association, pledging its co-operation to the millwork manufacturers in constructive endeavor. H. T. Didesch, of the Millwork Cost Bureau, Chicago, also delivered a talk. .

TO SPAN THE DELAWARE

A salute of 17 guns from the Olympia Admiral Dewey's old flagship, was the signal recently for the opening of the exercises which officially marked the beginning of work on the Delaware River bridge between Philadelphia and Camden, N.J.

The bridge will be one of the longest of the suspension type in the country. The main span will be 1,750 feet long and the total length of the structure will be 1.82 miles. Its cost is estimated at $25,000,000.

FIRES DURING 1921 IN MONTREAL

There were 1,776 outbreaks of fire in the city of Montreal during the year ending December 31, 1921. Of this number Investigator Constantin of the Fire Commissioner's Court found that 558 merited inquiry. This necessitated 1,582 witnesses attending the Fire Commissioner's Court. The causes of 809 fires were established, leaving 967 outbreaks, the origin of which was not determined. It was stated at the Fire Commissioner's Court that 50 per cent. of the fires were due to negligence.

ADDITION TO STEEL PLANT

Notwithstanding that the plants of the corporation are running at only one-third their normal capacity, the board of directors of the Bethlehem Steel corporation voted to appropriate $25,000,000 for the construction of additional works.

This was announced by Charles M Schwab, chairman of the board, in an address before the Hotel Men's Association of New York, recently.

Can You Define Millwork?

Much Confusion Exists with Regard to Use of this Term—Exact Definition Will Remove Point of Friction Between Manufacturer and Purchaser or Architect

How many readers of the "Canada Woodworker" can give an exact definition of what constitutes millwork. The term as used to-day has many applications, and often when a woodworker quotes on the millwork of a certain job there is a certain amount of confusion and even friction between the millwork man and the architect or contractor as to just what should or should not be supplied, because of the broad use of this term. The Southern Sash, Door and Millwork Manufacturers' Association have attempted a definition of millwork, which might well be used as a basis by others when figuring the millwork requirements of a job. The complete definition is as follows:

Millwork is considered to be that portion of wood building materials only, shown and specified for the construction of buildings as is usually made in a sash, door, blind and millwork factory, clearly detailed to scale of not less than 3/4 in. to the foot, and does not include anything in the way of rough or dressed framing lumber, flooring, ceiling, siding, grounds, furring, laths, shingles; no hardware of any nature, except sash pulleys and sash weights and cords for C. R. windows; no composition work of any nature, except column caps, unless forming a part of and attached to some piece of millwork on to which it must be fixed at the shop, nor anything else of any nature not made of dressed finished lumber.

The doors, transoms, side lights, windows, sash, blinds, balusters, columns, brackets, pedestals, newels, mantels, medicine cabinets, and panel wainscoting are furnished, made and put together, but never cut net, nor made to exact fit or exact size, sufficient wood being left to permit of fitting by the contractor or builder at the building. Panel wainscoting usually being furnished in sections.

Frames, jambs, colonades, inside trim, seats, cupboards, sideboards, bookcases, china closets, etc., are always furnished knocked down, except when plainly specified and ordered otherwise.

Inside and outside finish of all kinds and mouldings are always run and furnished in lineal ft. unless plainly specified and ordered otherwise.

Stairs are made and furnished knocked down and as follows unless otherwise agreed and contracted for:

The newels are put together, not housed and left sufficiently long to be cut to proper length by the builder.

The balusters furnished and left sufficiently long to be cut to proper length by the builder.

The strings furnished, housed when so detailed and left a little long for fitting by the builder.

The rail furnished in proper lengths, but not cut exact, being left sufficiently long for fitting by the builder. No rail screws furnished nor no connections made for same.

The crooks, ramps easements and turns are furnished in proper lengths, but not cut exact, being left sufficiently long for fitting by the builder. No rail screws furnished nor no connections made for same.

The treads worked and cut exact sizes and nosing put on when so shown, but never dove-tailed for balusters.

The risers worked and cut to exact size.

The well hole trim and wall base not cut to tread, other trim and moulding furnished in lineal ft.

The wedges and blocks in proper quantity and size.

The panel work as shown in sections, put together, but not cut exact, sufficient wood being left for proper fitting by the builder.

Knock Down (abbreviated KD)

Material made knocked down is understood that all the parts or members are to be worked to detail, or when of stock patterns, are to be worked as shown in our latest adopted catalogue, cut to proper sizes, bundled and marked, except where it is considered best by the shop to furnish in approximate lengths, such as window and door trim, shelving lumber, built-in cupboards, cabinets, outside steps and anything else for which the architects or builder does not furnish the exact net sizes, will always be furnished in approximate lengths to permit the builder to cut exact.

Measurements and Details

It being always understood that the builder or architect will furnish exact sizes and proper details. Should the factory be called upon to take measurements from the building or to furnish details for approval of the architect, or builder, a charge of $10 per day per man will be assessed, plus hotel bill and traveling expenses both ways.

Window and Door Trim

Inside trim for a window consist of any or all of the following as shown on details. Stool, apron, side and head eastings, inside stops, corner blocks, head blocks, jamb lining or extension jambs, cap mould, hoods, back band. (The head caps and hoods always KD).

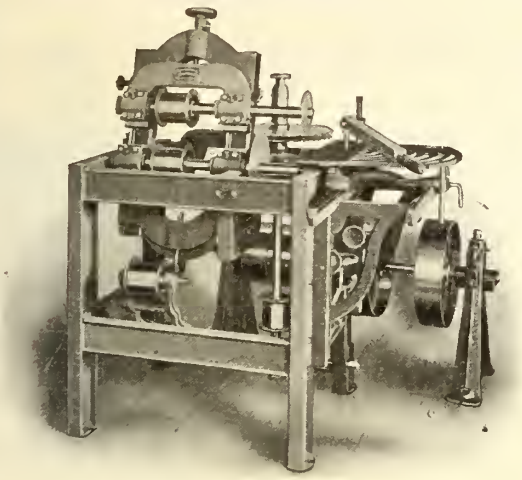
When outside frames are furnished and the inside trim is not included, the frames do not carry the inside sash stop, as it is contemplated that the sash stop must match the other members of the inside trim.

Thresholds or carpet strip go with the inside door jambs or frames, as they are included in our catalog list prices for same.

McLaurin-Jones Co. Organized

The Ideal Coated Paper Co., Brookfield, Mass., announce that their organization has amalgamated with Samual Jones & Co., Newark, N. J., and the Ware Coated Paper Co., Ware, Mass., into one corporation known as the McLaurin-Jones Co. The new company is in a position to supply a wider range of gummed and coated papers, ceiling tapes and other kinds of paper.

The disadvantage of a universal woodworker is the crowding together of too many machines. It would be wiser to cut out one or two machines and give more room to the others.



No. 19 Saw Tenoner
No. 20 Large Saw Tenoner

Fitted with five saws, has replaced cutter head machines; for all jointing and halving in wood shops and for automobile and carriage wood-work it is the best machine on the market.

Much door, window, sash, furniture and cabinet work is done with this machine where a nice, smooth tenon is required. It is also used for the halving and jointing of stock at any angle.

Tenoners equipped with flexible coupling for direct motor drive or for countershaft.

No. 19 Small Saw Tenoner
No. 20 Large Saw Tenoner
No. 21 Regular Bevel Saw
No. 22 Large Bevel Saw
No. 23 8½" Irregular Dresser
No. 24 6" Irregular Dresser
We also manufacture metal working machines.

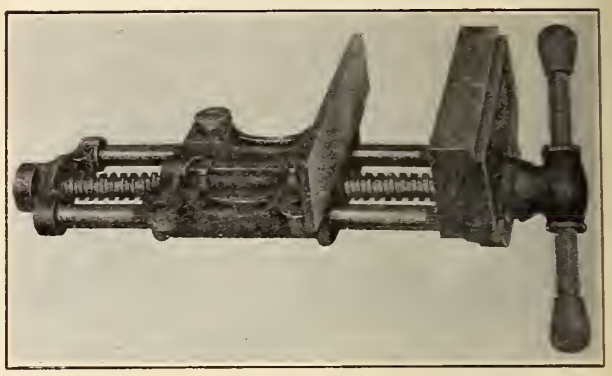
The Vise You Swear BY not AT



On the Market for 15 years.

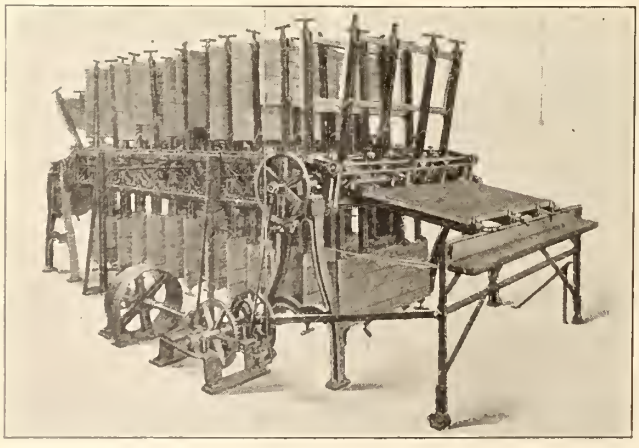
Globe Vise & Truck Co.

GRAND RAPIDS, MICH.

We also manufacture a complete line of steel trucks particularly for wood working factories. The body of our truck is absolutely indestructible, and there are no nails nor screws in the top to mar material, whether finished or unfinished. The roller bearing feature in the wheels allows for much easier handling than the old style plain wheels on the wood truck. In fact one man can handle much more material than on the old style. The price is very little more than that of the old style wood trucks.

One Man Does the Work of Two

with a Billstrom Glue Clamp Carrier



For every plant where much edge-gluing is done there is a real need for a Billstrom.

Here's why.—

The empty clamp is held at just the right height for the greatest convenience of the workman.

When the clamp is filled he pulls a cord, which carries the filled clamp away and deposits an empty one in its place.

One man can accomplish as much by using it as two men can do employing the old methods.

It holds the work off the floor until the glue has set, when the glued stock can be quickly removed and piled flat, thus greatly conserving space.

It reduces the labor and cost of edge gluing to the minimum.

There is a size to suit your particular requirements.

Where Black Bros. Clamps are known, there is no second choice. Know them.

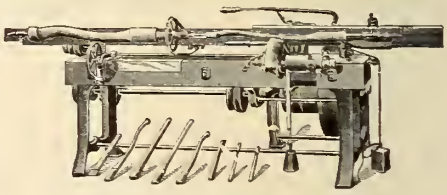
Sold by Aikenhead Hardware Ltd., Toronto Vokes Hardware Co., Ltd Toronto J. L. Neilson & Co., Winnipeg and other leading dealers throughout Canada.

The Black Bros. Co. - Mendota, Ill., U.S.A.

Klotz Machine Co's

Handle Machinery

Used Wherever Handles Are Made



42-Inch Handle Lathe

Lathes for turning Ax, Adz, Hammer, Hatchet, Pick, Sledge Handles, etc., and for turning other irregular articles. Bolting, Blocking, Shaping and Cut-off Saw Machines, Handle Knobbers, End Shapers, Polishers and Throaters.

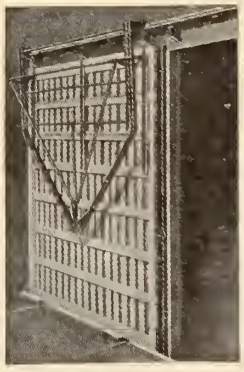
We also make Wine Maker's Machinery, Shafting, Pulleys, Hangers, etc.

MANUFACTURED BY

Klotz Machine Co., Sandusky, O., U. S. A.

Write for descriptive circulars and prices.

The Door Carrier System



Makes your dry-kiln doors steam-tight and saves time, heat, trouble and money.

Carrier lifts door clear of kiln and carries it down track. Returning, deposits door to rabbeted joint, where it is held steam-tight by its own weight. Applicable to old or new kilns.

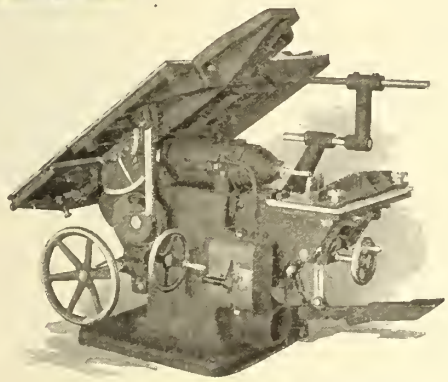
OLIVER



Oliver No. 80 Precision Saw Bench

This Motor-on-arbor-Saw Bench is the "last word" in saw bench design and construction. It is built with or without mortising and boring attachment, with plain or patent ball-bearing sliding table section.

Full details upon request.

"OLIVER" WOODWORKING MACHINERY
Is Known The World-Over For Its Quality

OLIVER MACHINERY CO.
Grand Rapids, Mich., U. S. A.

The Canadian Appraisal Co. Limited

The Pioneer Appraisal Organization of Canada

Established 1905

"An adjustment of fire insurance in accordance with existing values is a universal necessity. Many people who now believe that they are properly covered against the fire risk are, in reality, inadequately covered. Morever, realization of these facts is by no means general."

The Chronicle

Over 85% of the appraisals made during the past fifteen years of Canadian manufacturing and industrial properties have been carried out by us, aggregating some 5.000. properties, and include over 250 lumber and woodworking plants.

Automatic Hole-Cutting Machines

The Wheel and Hole Cutting Machine has four automatic movements, all of which work in perfect unison, performing their functions in clock-like regularity.

The Hand-Hole Machine will cut hand holes in crate and box ends. It is worked by a carriage and levers, and will cut any size or length hole with either round or bevel edge in any kind of wood.

The twenty-horse-power induction motor with end cap removed showing the self-aligning ball bearing. Note that the ball bearings are contained within simply constructed bearing head brackets with liberal lubricant chambers, which are sealed on both sides by end caps. These end caps are fitted close to the motor shaft and are practically proof against leakage of lubricant, as well as the intrusion of moisture, dust, lint, grit and other foreign substances from without.

The use of ball bearings in electrical machines—

has been a continuous growth and is fast coming to be considered vital to the best mechanical practice in the design of electrical machinery. So marked is this fact that today the leading manufacturers of electrical machinery have a standard line of ball bearing motors.

Self-aligning ball bearings marked SKF are particularly adapted for motor uses and are so nearly frictionless that wear is practically eliminated. This insures perfect rotor alignment almost indefinitely with a constant high efficiency air gap for maximum motor life. And because they are wear-free, the bearings run cool and require a minimum of lubrication and attention.

The engineering experience of our organization is at your disposal. You are urged to submit your bearing problems to us for careful and impartial consideration.

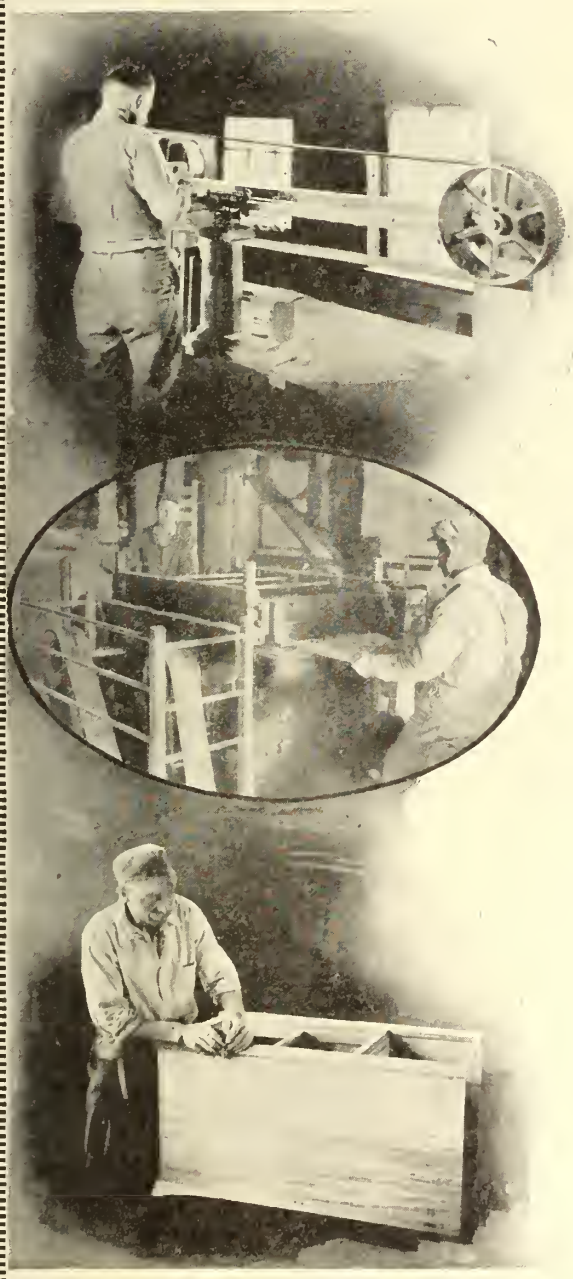
Three Operators With But a Single Thought—

The Efficiency Of Carborundum Brand Garnet Products



HERE are three men doing three widely varied sanding jobs and doing them mighty well.

One is sanding gumwood boxes for toy blocks. He takes 1/64 off the four sides sanding 1,000 boxes complete with one Carborundum Brand Garnet Belt.

He says he never had a belt to do the work so well.

Another is sanding washing machine bottoms on a drum sander. His comment was that "Carborundum Brand Garnet stands up better—does more work, lasts longer. We have no kick of any kind."

And then we have the hand sanding of phonograph cabinets. The operator here says that he gets a cleaner, more uniform finish, the paper doesn't crack or peel and it's fast cutting and extremely flexible.

Carborundum Brand Garnet Products
Make Good Sanders Better Sanders

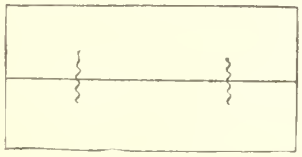
The Morgan Shook Splicer

uses narrow stock

It automatically feeds, cuts and drives corrugated fasteners. Adjustable—handles fasteners from 1/4" to 7/8" in width and from 3/4" to 1 1/4" in length.

Speed, Accuracy, Economy



We manufacture Matchers, Printers and Nailing Machines.

WE INVITE YOUR INQUIRY

Morgan Machine Co.
Rochester, N. Y.

Is it economical ?

Is it the right type ?

Is it the right size ?

THREE GUESSES

Electric power, heating, lighting and equipment problems are to be found in the lumbering and woodworking industries.

Perhaps your output can be increased? You are, perhaps, losing electrical energy by wasteful types of motors? Are your switches and wiring devices up-to-date or are you in continual danger of fire?

We shall be pleased to answer any questions or help you with any problems whenever you care to write us.

SIMONDS
CIRCULAR AND BAND
SAWS

In every mill or woodworking shop in the land the demand for greater production is urgent. Devious methods to secure the desired results are being tried out. Some are making good—some are not. They have the manpower, but they can't get production. Many mills and woodworking shops have discovered one of the greatest hindrances to efficient operation are poor saws and knives. The saws dull easily and do not hold their tension, while the knives lose their cutting-edge quickly and this results in unsightly marks on the lumber, and consequently damage.

Inferior saws and knives are being discarded by many, and in most cases Simonds Products are replacing them. There is no question about Simonds Saws and Knives They are made of the finest steel obtainable, hardened and tempered right and make mechanically perfect. They produce smooth lumber and cut down your operating expense.

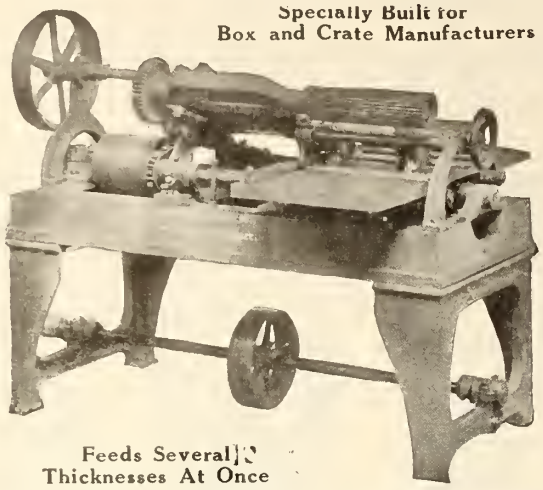
"The Chattanooga" — Just Another Name For Fast, Economical Gang Ripsawing

Specially Built for Box and Crate Manufacturers



Feeds Several Thicknesses At Once

This latest improved gang ripsaw is powerful, fast, safe and eliminates wastage. For gang sawing boards into strips or head sticks and for ripping veneers it is unsurpassed.

Has powerful feed and securely holds down and feeds short pieces. The feed rolls are automatically adjustable to varying thicknesses. Upper rolls are driven by cut gears, and the lower ones by sprocket chain. Several thicknesses of veneering can be fed thru machine at one time.

The CHATTANOOGA is an unusually big producer, easily operated, and turns to profitable account short stuff lying around a mill—otherwise wasted.

Attractive price. Complete information on request

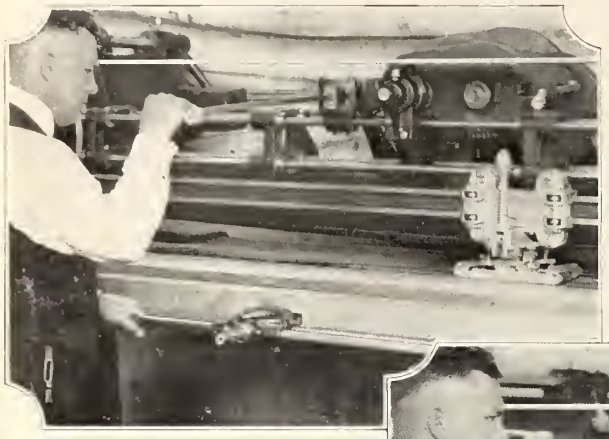
MADE IN CANADA

William R. Perrin

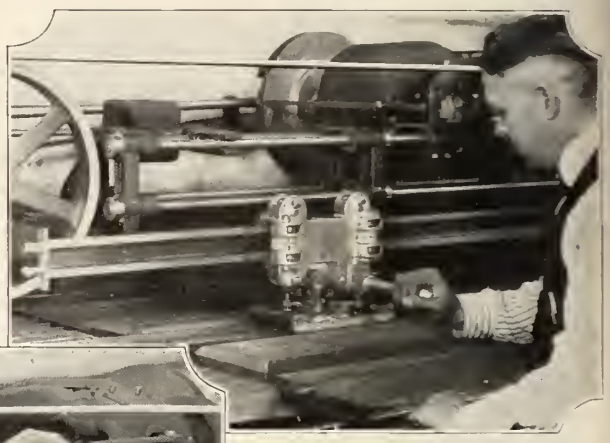
Limited

TORONTO — — Ontario

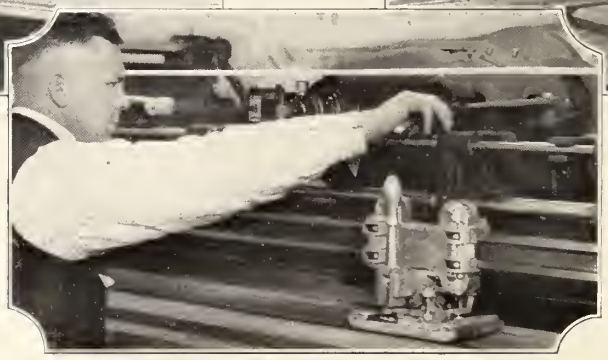
Sand Your Flat Surfaces Automatically



One telescoping hand lever varies length of power stroke and provides pressure contact.



Sanding shoe released from power driving band for spot sanding by hand.



Changing speeds on sanding shoe accomplished by merely pushing clutch lever to the right or left.

THIS brand new No 124 Automatic Sander represents the first real advancement made in this type of machine in many years. It combines power stroke with hand-controlled contact, for spot sanding—really two machines in one. Operator easily adjusts length of power stroke and number of strokes per minute, without moving from his working position.

ALL lost motion at end of stroke is positively eliminated by means of our double-end drive and take-up devices. This insures a smooth reverse motion and prevents any waves or ridges at end of strokes. These are but a few of the many improved features—we want to tell you more about it. Write for descriptive bulletin No. 124.

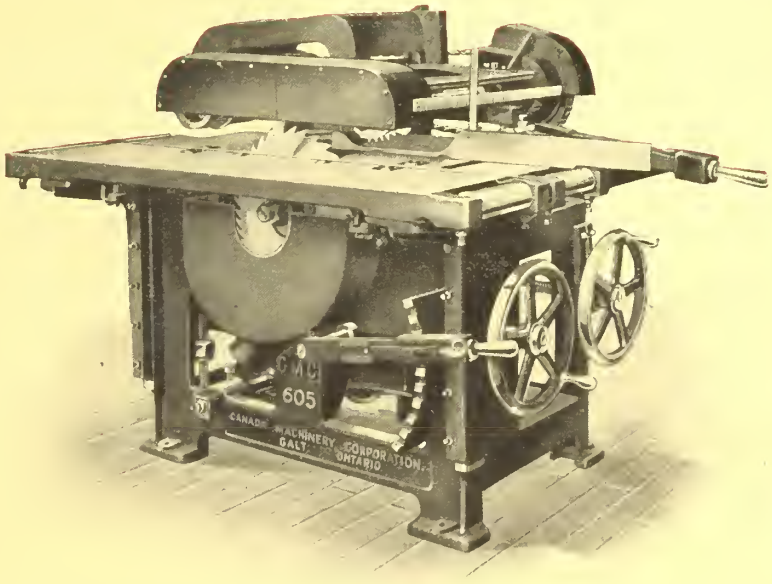
A "605"
Speeds Production
Raises Quality
Satisfies



No. 605 New Improved Self Feed Rip Saw

Why?

Because it will rip up to 225' per minute.

Because it can be set quicker and easier than old type machines.

Because it rips straight—the strain on the feed is directly in line with the cut and it must go straight.

The table is gibbed to the frame just like a planer.

Because it turns out a lot of first class work.

The Bulletin will tell you why?

Everything in Woodworking and Metal Working Machinery

A BETTER MACHINE, FOR A BETTER JOB, FOR BETTER TIMES

We have the following very fine machines to offer—a few selections from our very large stock—

Practically new type 2-G Yates Straight Edge Rip Saw, with a 10" saw, revolving bed.
Used McGregor Gourlay QY 15 x 6 Planer and Matcher. Thoroughly overhauled.
Practically New No. 112 Fay and Egan "Lightning" Flooring Planer, planes and matches 6" wide, 4" thick, 8 feed rolls. 40 HP required to operate.
New No. 162 Preston High Speed Ballbearing Shaper speed 7,000 revolutions per minute. Table 58 x 41, spindles 1-¼", 28" centres.
Used 24 x 6 Cowan Planer and Matcher, like Cowan No. 11, but the gears are not guarded.
Used No. 4½ 30" American Sectional Roll Cabinet Planer, a very fine surfacer, for cabinet work, in hard or soft woods, with sectional feed rolls and sectional chipbreaker.
Used Wysong and Miles type Belt Sander. In first-class condition.
New No. 143 Preston 10" moulder on base, fitted with slip on heads, variable feed. Latest design embodying all known improvements.
Used 42" Berlin Royal "Invincible" 3 drum Sander, with power raising rolls and spiral drums, with solid bed.
Used 48" Berlin "Invincible" three drum Sander, with spiral drums and hand power raising rolls.
Practically new 20" Preston Jointer, with round safety cylinders.
New 12" Preston Jointer with round safety cylinder.
New C.M.C. 12" Buzz Planer with round cylinder.
Used No. 177 30" Berlin Double Surfacer with divided rolls.
Used 26 x 10 McGregor Gourlay Double Surfacer, similar to C.M.C. No. 216.
No. 107 Crescent Woodworker, consisting of 26" band saw, with tilting table, rip and cross cut saw table, reversible shaper, Boring Machine, and 12" Jointer. This is the last word in woodworker construction.
Beach No. 8 Rip and Cross Cut Saw Table, with 6" Jointer, and Boring Machine.
Beach No. 3 6-stop Boxmaker's Cut Off Saw, with 6' carriage. An indispensable machine in a boxmaking Plant.

The Prices are Right.

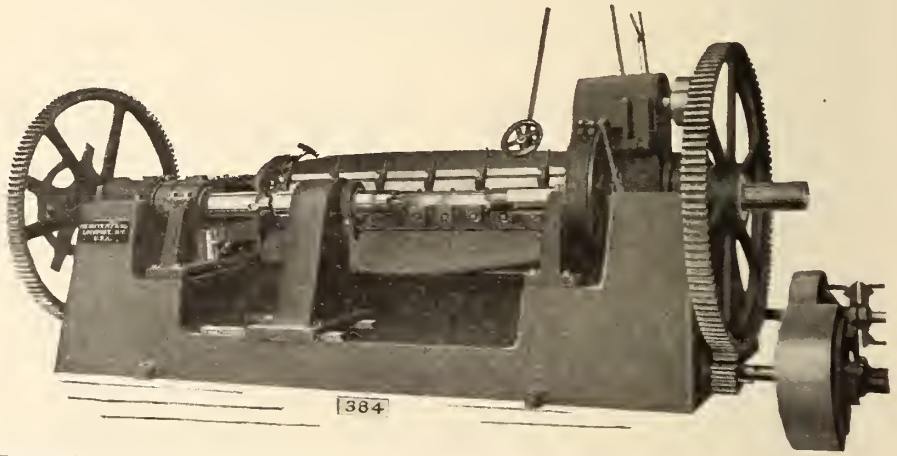
Valuable Features of the Merit Veneer Lathe



The FEED GEAR MECHANISM is simple, compact and powerful. No chains.

The POWER DOGGING and QUICK FEED motions are provided by double frictions giving the same speed in both directions.

There is an automatic stop to throw out the feed before the chucks are raached.

The KNIFE MOUNTING provides a hand wheel PITCH CONTROL as well as an AUTOMATIC PITCH to maintain the same knife setting for all sizes of log.

The PRESSURE BAR is under control of a hand wheel which regulates the pressure over the WHOLE LENGTH OF THE CUT. An eccentric rotary mounting gives this bar THREE POSITIONS,—(1) Cutting position (2) Clearance position (3) Tilted position. All three are operated by THE CLEARANCE lever which draws back the bar, tilts it, and returns it to the original position without changing the working adjustment.

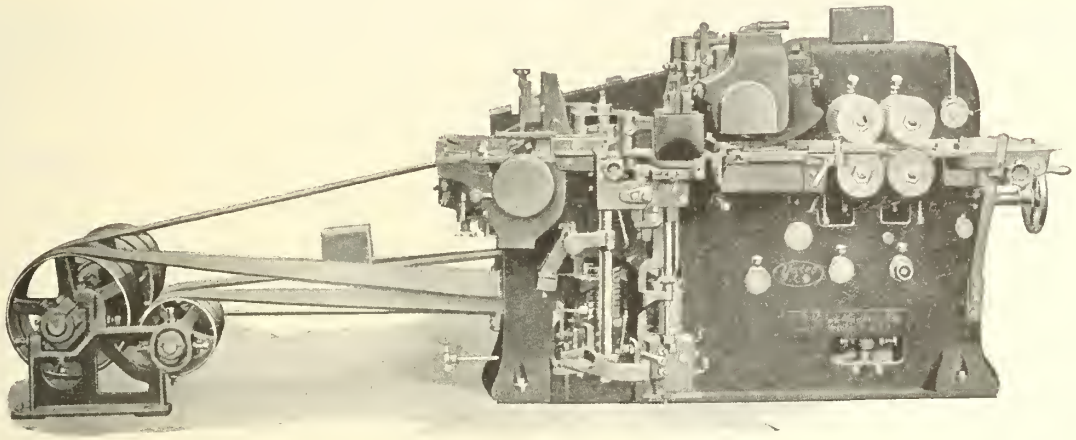
An AUTOMATIC VERTICAL adjustment of the bar maintains the proper height for each thickness of veneer.

MERITT

VENEER MERIT MACHINERY FOR FAR SIGHTED BUYERS

MERRITT ENGINEERING AND SALES COMPANY LOCKPORT N.Y.

VENEER MERIT MACHINERY FOR FAR SIGHTED BUYERS



TYPE "C" MOULDER

The type "C" Moulders were designed for turning out the smaller size mouldings at high speed and still give you that fine finish which is necessary on this class of work. As you will note from the above cut it is a very compact machine, takes up less room than the old sticker and is entirely open side, which allows for quick set ups and changes as well as ease of adjustment. Feed Ranges up to 100 feet per minute are provided. Built in two sizes C3 4″x4″—C4 4″x8″.

Many other features are described fully in a circular we have prepared.

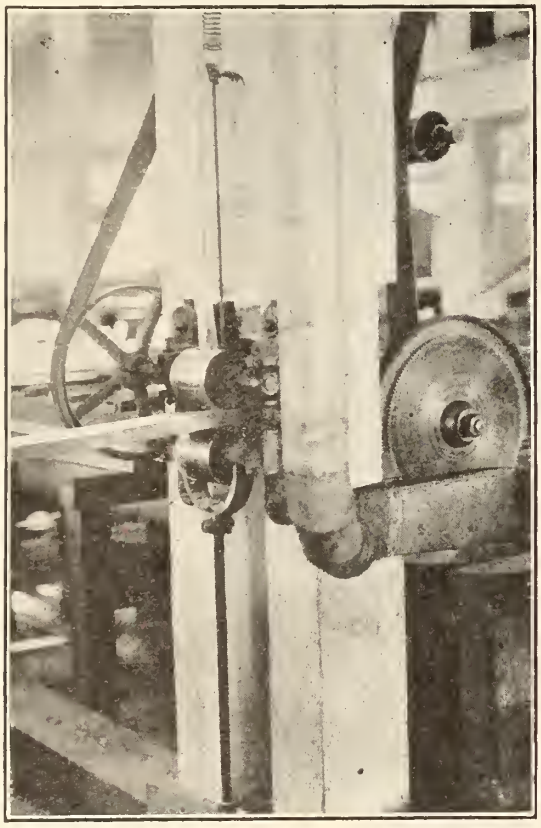
YATES

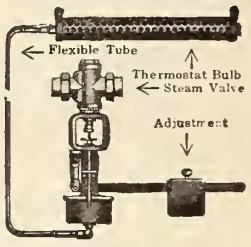
A Real Trimmer



This is a high speed machine to be used in sawmills and box factories where speed is required. Allows men to use both hands when trimming. Nothing to get out of order. This is the fastest trimmer on the market.

Arbuthnot Lumber, Sash and Door Co.

Vancouver, B.C.



The Powers Regulator No. 15

For control of air temperatures. The thermostat bulb is so constructed that it may be placed in any position in the room to be controlled, and connected with the steam valve by a flexible tube, of any required length. It is very sensitive and reliable. Entirely automatic and self-contained requiring no outside power for its operation.

Do You Know—Or Do You Guess?

You take pride in the uniform quality of your output—you insist upon exactness in every operation.

But do you *know*—in the kiln, where temperature is so vital a factor—that the heat is always exactly right?

If temperatures are controlled by hand you *know* the variations will creep in—but you *guess* there won't be enough to affect the final result.

Don't Guess

Control temperatures with a Powers Automatic Thermostatic Regulator and *know* that the variations won't occur.

Our Bulletin will be sent free on request and we will gladly answer any questions on heat control. It has been our sole business for over 30 years.

The Shimer Round Safety Cylinder with High Speed Knives

A Round Safety Cylinder that will Appeal to the Buyer and the User for three Reasons:

The first is our adjusting nut for setting the knives. It is the only cylinder with properly located adjusting nuts for setting the knives, which, with our way, can be set to 1-1000 of an inch.

The second is our way of holding the knife without tapping into the head.

The third is the correct angle of cut for the knives.

Made for Any of the Different Makers' Machines and in Any Length Cylinder.

"Steelgrip"

METHOD IS THE BEST

for making mitered, butt or any other joint

Used by all leading Furniture, Cabinet and Casket Manufacturers.

In using *"Steelgrip"* CLAMP NAILS

only the ordinary machine work is required. Cut a slot, drive in a "Steelgrip," that's all. No clamping, no waiting for glue to set.

Avoid Substitutes

"Steelgrip" CLAMP NAILS

Save Time + Labor = Money

Produce, Strength + Durability = Better Product

Shipped in cartoons of 1 lb. 5 lbs. and 10 lbs. each. Bulk packages 25 lbs., 50 lbs. and 100 lbs. each

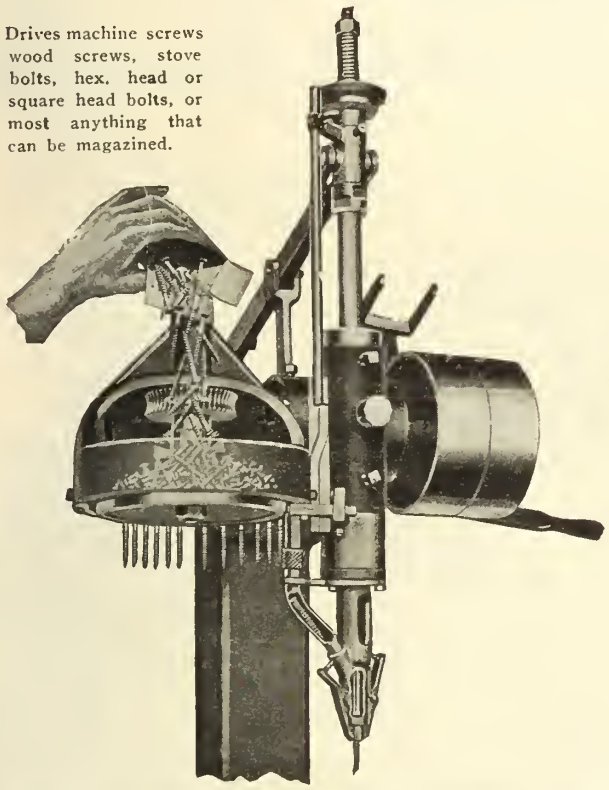
CIRCULARS and SAMPLES ON REQUEST.

The Demand is for Lower Prices!

Drives machine screws wood screws, stove bolts, hex. head or square head bolts, or most anything that can be magazined.



Reynolds Automatic Screw Driving Machinery will help you meet the demand

Everywhere the manufacturer is faced with the problem of price reduction. How can he find the solution?

By cutting out every waste—of time, labor materials, etc.

Many manufacturers have installed Reynolds Screw Driving Machinery for this reason. It accomplishes the work better in one-third of the time.

Consequently they are able to meet the demand for lower prices and hasten the return to normal buying.

Are you interested? Then write us to-day for the full facts.

Send us dimensions over all of your work and gauge and length of screws driven so that we can determine the proper size and type machine to meet your requirements.

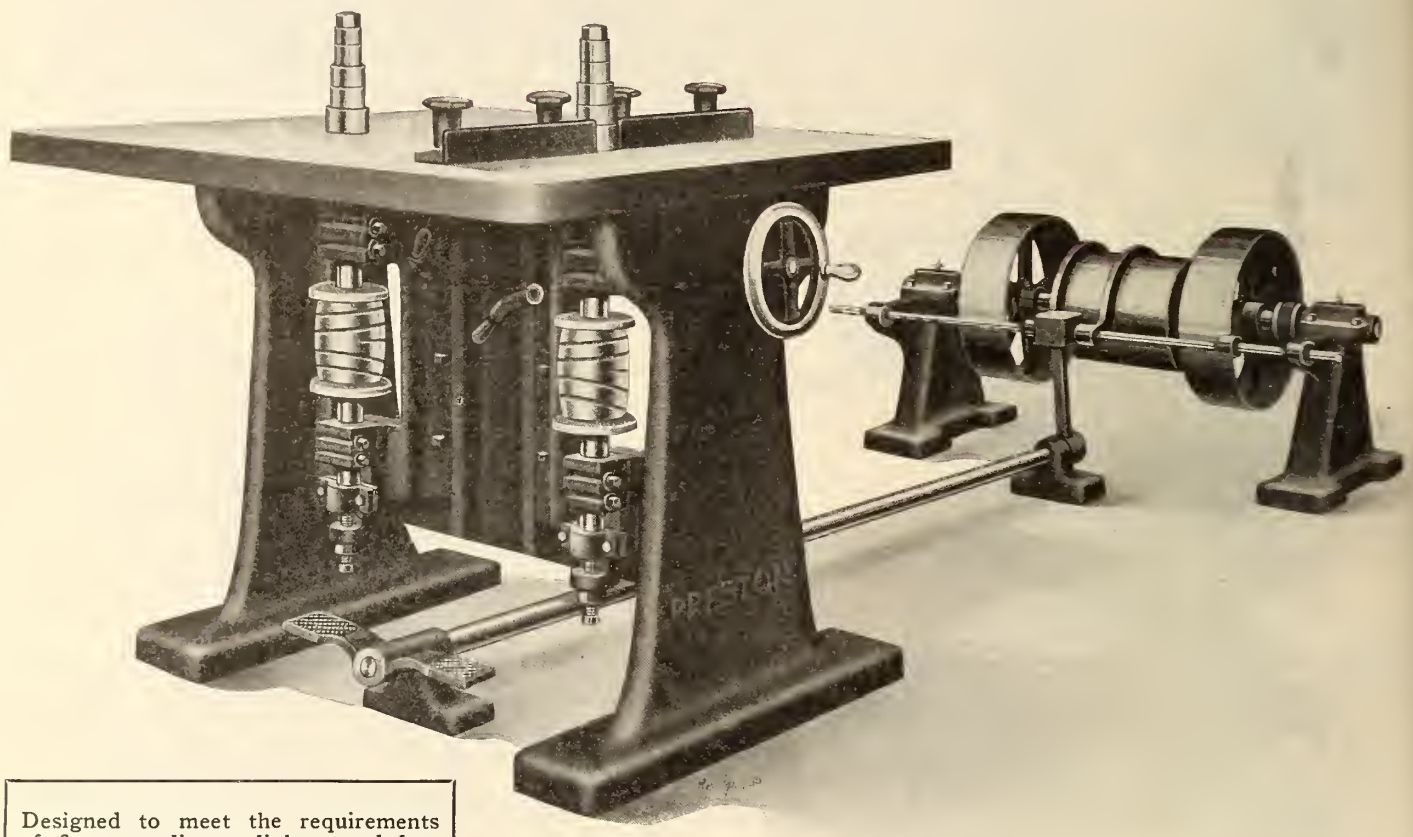
A NEW SHAPER
"Preston" No. 164 Ball Bearing



Designed to meet the requirements of firms needing a lighter and less expensive Shaper than our No. 162.

Made with

Babbitt Bearings, Plain Countershaft
S K F Ball Bearings, Plain Countershaft
S K F Ball Bearings, Special Countershaft

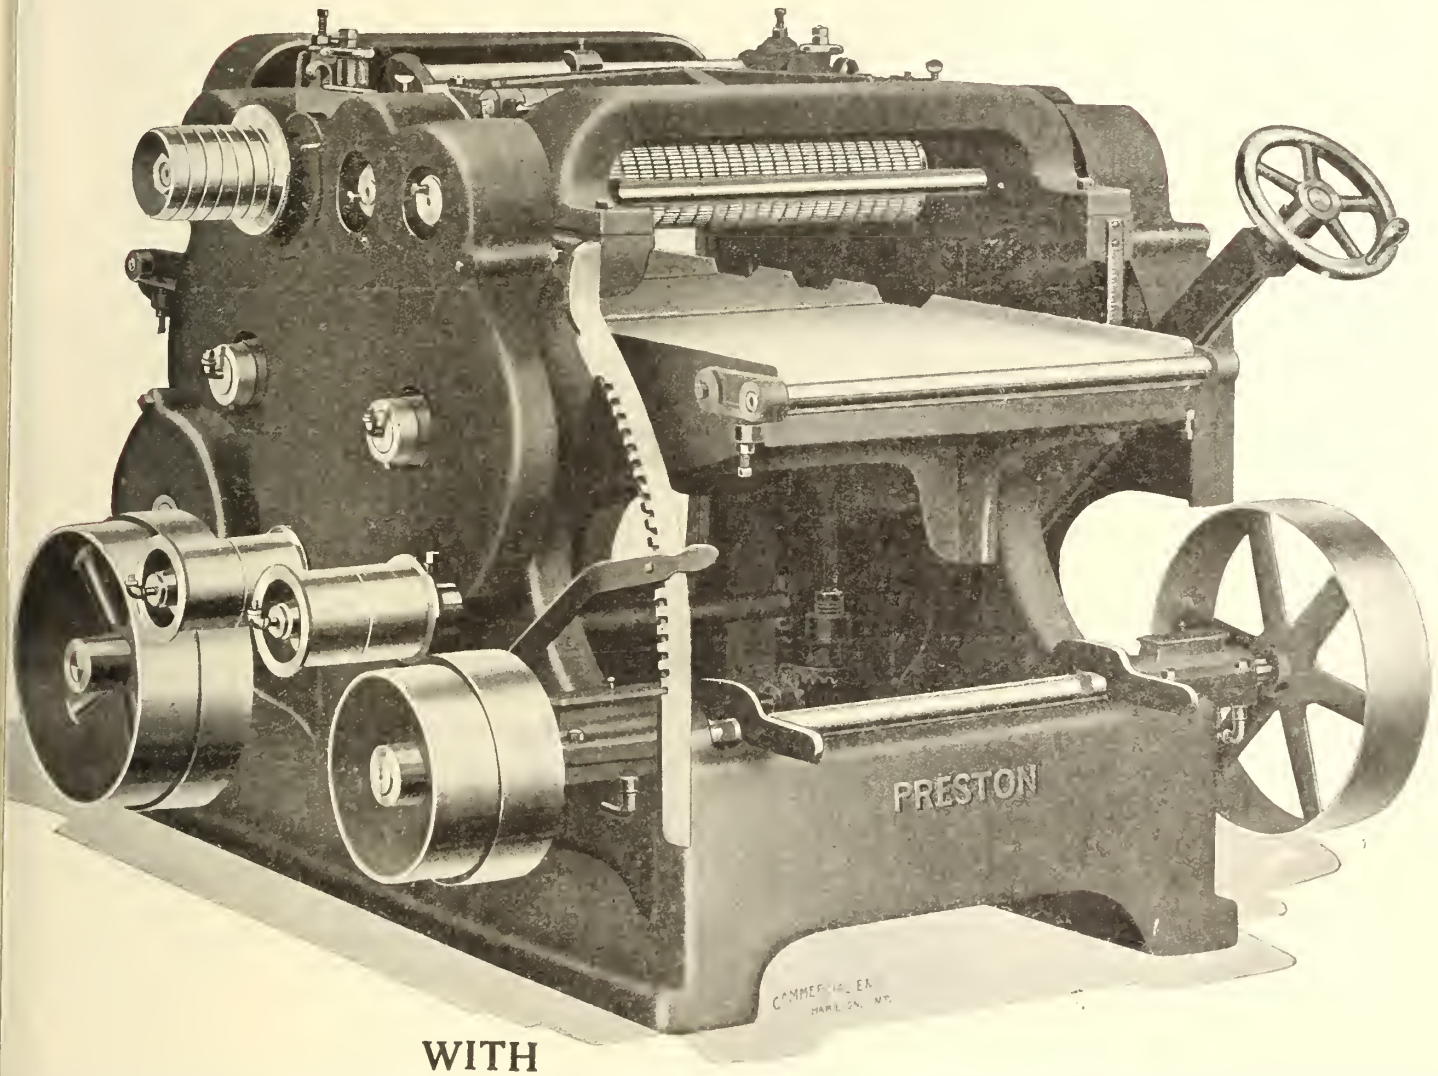
This machine, equipped with BALL BEARINGS, will be found particularly suitable for the needs of many firms. Don't hesitate to ask for information.

WE ARE SHAPER PEOPLE and make Shapers for every purpose. Ten years of careful study and research have placed us in the enviable position of being able to supply information and advice not easily gained elsewhere.

The Preston Woodworking
PRESTON,

We are Sole Manufacturers of and Agents in Canada for the Eaglesfield Patented Beltless Swing Saw.

No. 123 "Preston" High Speed Ball Bearing Surface Planer



WITH

(1) Specially selected S. K. F. Ball Bearings (2) Sectional Roll and Sectional Chipbreaker (3) Round Cylinder with 4 High Speed Knives (4) Stockbridge Knife Grinder and Jointer (5) Cylinder Speed, 5000 r.p.m.

IT WILL:—(1) Reduce Your Sanding Costs! and (2) Increase Your Production!

WE GUARANTEE THESE TWO POINTS. Your planing will not only be done much more quickly but it will be done so much better that a very great percentage of your sanding will be eliminated. Let's prove to you how quickly it will pay for itself. Competition is keen and it will surely reduce your production costs and help you in the race.

ASSET vs LIABILITY

Are your present Dry Kilns producing perfectly cured lumber, in the least possible time and at a minimum cost? If not, your kilns are a liability and you are daily adding unnecessary expense to your production cost.

NATIONAL AUTOMATIC HUMIDITY CONTROLLED DRY KILNS will not only meet the above requirements, but will pay for themselves in from one to two years' operation. Recently one of our customers, in writing about their kiln, made the following statement: "The controls, together with the arrangement of the equipment and the modern instruments, have enabled us to put our unusually green Oak lumber through with such a great reduction in degrade as to substantially permit us to state that the first two years of operation will pay the entire cost of the new installation, merely by saving in degrade. We believe you are to be congratulated upon your product and that we are to be congratulated upon being the possessor of this installation."

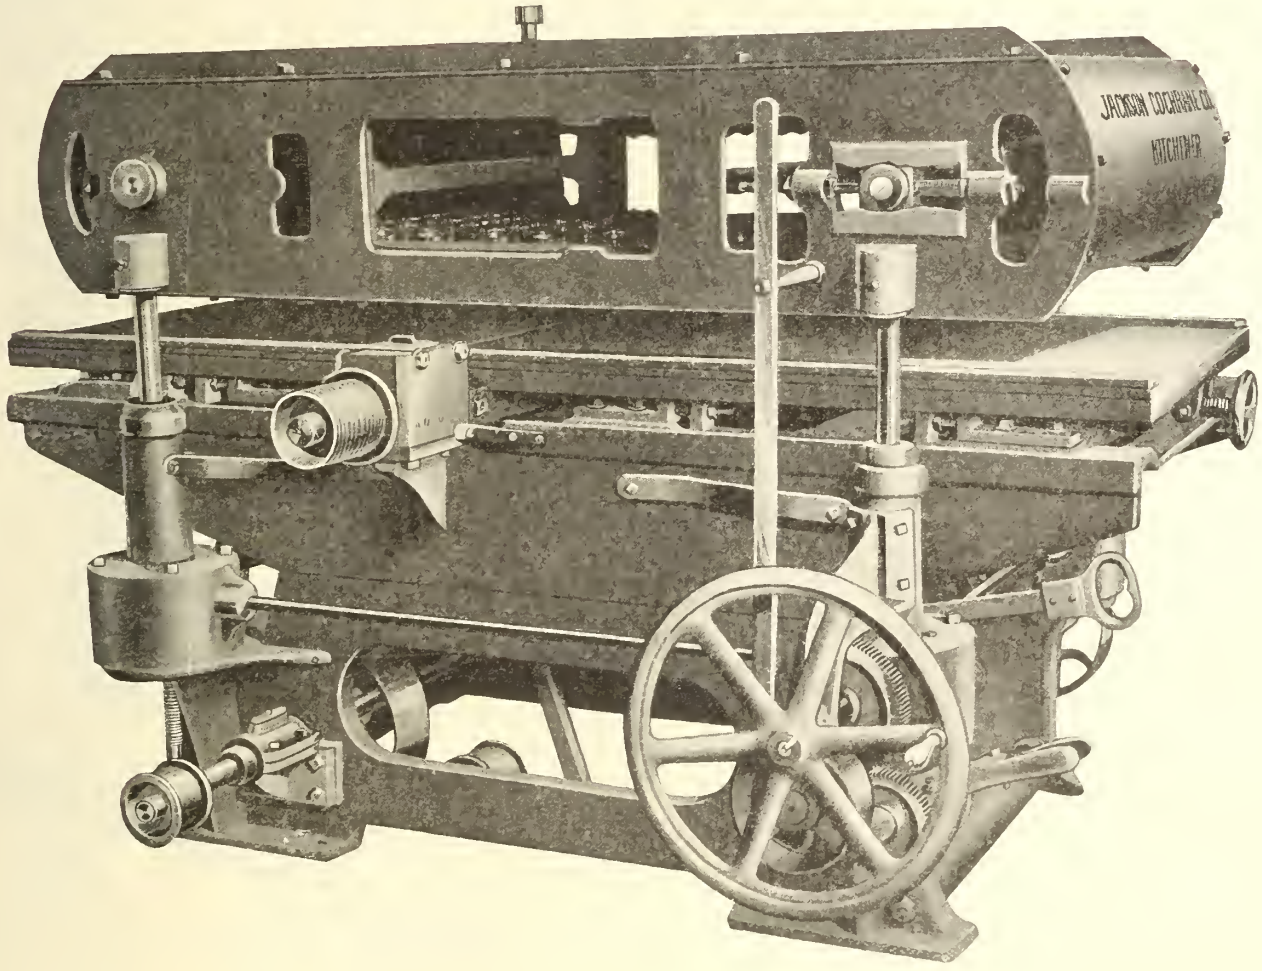
"HERZOG" SELF - FEED JOINTER



Two Boys Could Operate this Jointer for You

Think what a saving that would effect in your shop—two boys doing the work—better—and from three to five times faster than hand jointers. Such efficiency is made possible by the many splendid qualities the machine posses ses, its simplicity of operation, its ruggedness of construction and its ability to work at high pressure without frequent breakdowns.

The Herzog Self-Feed Jointer handles stock varying in width from 1 inch to the full width of the machine. It will operate at fast or slow speeds while the knives require about one-fifth the attention given hand jointers.

We would like to send you full particulars and prices. May we?

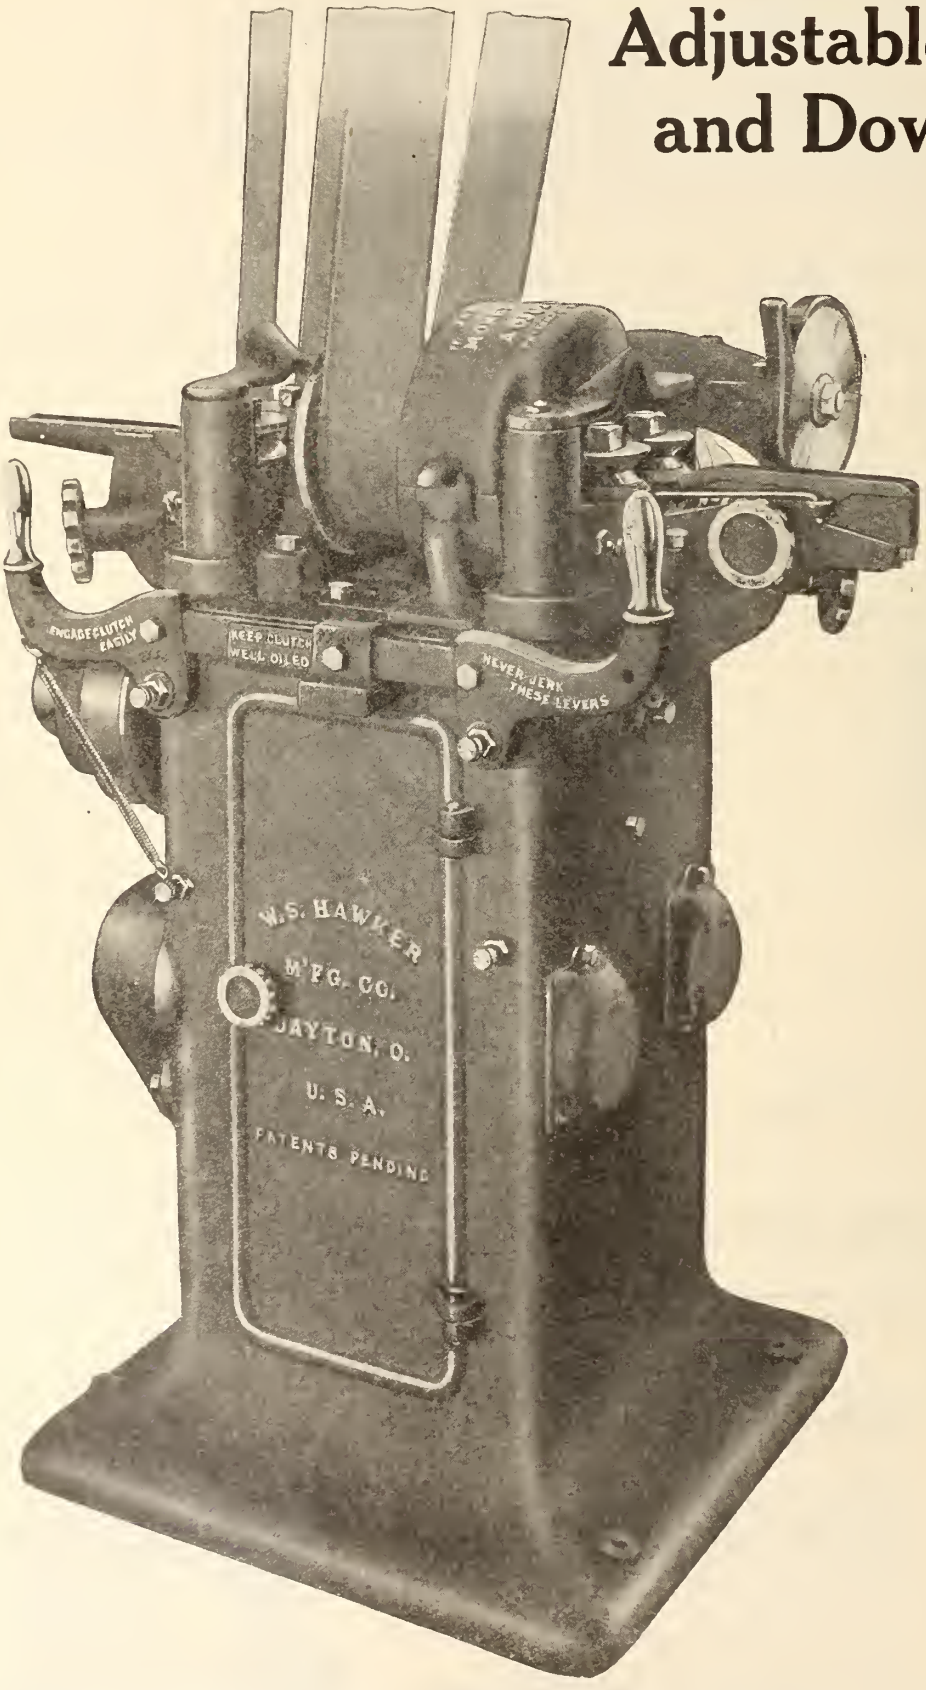
The Money Maker— Adjustable Rod and Dowel Machine



Capacity 30,000 to 40,000 lineal ft. per ten hours on 7/8 or 15/16 mop or sweeper handle stock.
If you are using any dowel machine of less capacity, figure your daily losses in labor and business.
Write us what dowel sizes you turn, and whether hard or soft wood. Ask for our demonstration proposition to show you how to double your production of dowel stock at the same labor cost.

The machine that is sent under a guarantee to show you a gain of from 100 to 400 per cent before you buy it.
The improved dowel machine that 90 per cent of the largest and oldest machinery builders and dealers now endorse and recommend in preference to the solid chuck machines they themselves previously built.
One cutter head turns from ¼-in. to 2-in. diameter.
Turns hard or soft wood equally well.
Handles heavy, oversized squares.
No choking of the cutter head.
Smooth stock.
Accurate sizes.
Works stock as short as five inches.
Rolls automatically center variations in squares.
Machines built to turn from ⅛ to 6-in.
We want to hear from every user of a solid chuck dowel machine.
We can save you from one dollar out of every two, to four out of every five that the operation of solid chuck machines costs you.
Engagements for competitive test solicited.
Formal orders not solicited. All sales made after demonstration.

The only question is, are you willing to cut cost of your dowel turning to one-half or one-third of what it costs with any make of solid chuck machine?
Machine delivers the goods before you buy.
State conditions of stock closely Special conditions require special equipment.

A Small Article
of Great Importance

Realizing the importance of efficient casters, we have made a specialty of this line and as proof of their quality we need only say that many of the foremost furniture manufacturers are using them exclusively.

By the way don't it seem logical that a Canadian-made caster should be the right one to use on Canadian-made furniture? Assuming of course, that it equals the standard of the imported article?

If you believe so too, just write us for samples and prices.

ECONOMY

THE kind of a man who demands glue for economy will be careful not to buy a glue that is low in quality also, even at a slight difference in price. One feature alone in Perkins Glue, Uniformity, is worth that difference.

The satisfaction of knowing that the glue used today is as dependable as that used last week, and what will be used next month will be as reliable, is a source of pleasure.

As one large manufacturer said, when discussing glues, "I buy Perkins, charge the price to the cost of materials and forget all about the glue-room problems," which was the same as saying that he had no more "costs" to charge up to manufacturing his panels because of loose veneers, blisters, etc., either in the plant or after his goods had been shipped.

LEWIS THOMPSON & CO., Inc. Offices: 49th and Botanic Ave., Phild. Yards: New Orleans, Phild., New York

WE ARE TELLING THE PUBLIC: "BE SURE YOUR WALNUT IS REAL WALNUT."

AMERICAN WALNUT
"The Cabinet-wood of the Ages."

WE ARE TELLING THE PUBLIC: "BE SURE YOUR WALNUT IS REAL WALNUT."

THEY LIKE WALNUT

It is largely due to our persistent and steadily increasing national campaign of advertising, as well as to the superior merits of the wood itself, that the almost universal preference is for American Walnut for furniture, paneling, trim, etc., in good buildings of all types.

This is "The American Walnut Period"—and it will be a long one—a market fact of which progressive manufacturers of fine furniture are keen to take all proper advantage.

Write for a copy of the Walnut book, which is carrying the message of Walnut to the home, architect, furniture trade and woodworker. Sent free.

Office and Mill: McLean Ave. and Union Belt R.R.

Memphis - Tenn.

We sell only the product of our own mills and make band sawn lumber in all Southern Hardwoods.

We specialize in Quartered White Oak, Red Oak, and Red Gum.

With allied companies we make fifty million feet annually.

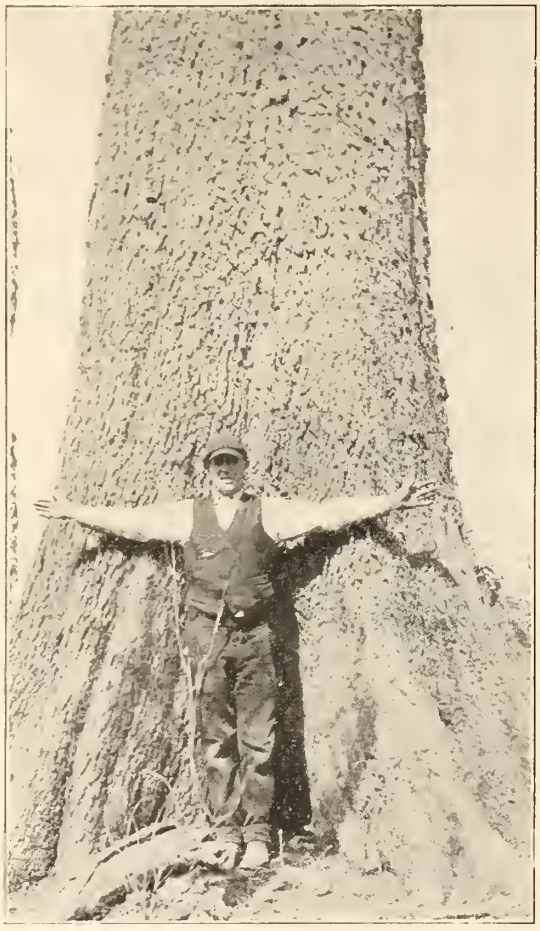
Attention Hardwood Buyers!



The Spring Trade Revival

Building permits are running larger than for many years, forecasting a brisk Spring trade by the lumber consumer. Have you covered your Spring requirements?

Upper grades of HARDWOODS are scarce and getting scarcer. DO IT NOW!

Wire Our Expense for Price Quotations

Chapman & Dewey Lumber Company

MEMPHIS Tennessee

Why Bruce Hardwoods Excel

For many years before we became hardwood lumber manufacturers, we were makers of fine Oak Flooring and are to-day the largest individual producers of that material.

The producing of good Oak Flooring is an exacting science—where perfection is attained—and teaches the value of both skilful grading of raw material and accuracy in milling.

With a full appreciation of the value of these factors, we entered also upon the manufacture of southern hardwoods and in the operation of this department, have applied them in the production of all items in white and red oak, gum, ash and other species.

With our joint facilities, we are equipped to ship square edge parquetry strips, oak trim and mouldings, as well as Oak Flooring in the same car with hardwood lumber.

Inquiry and correspondence invited.

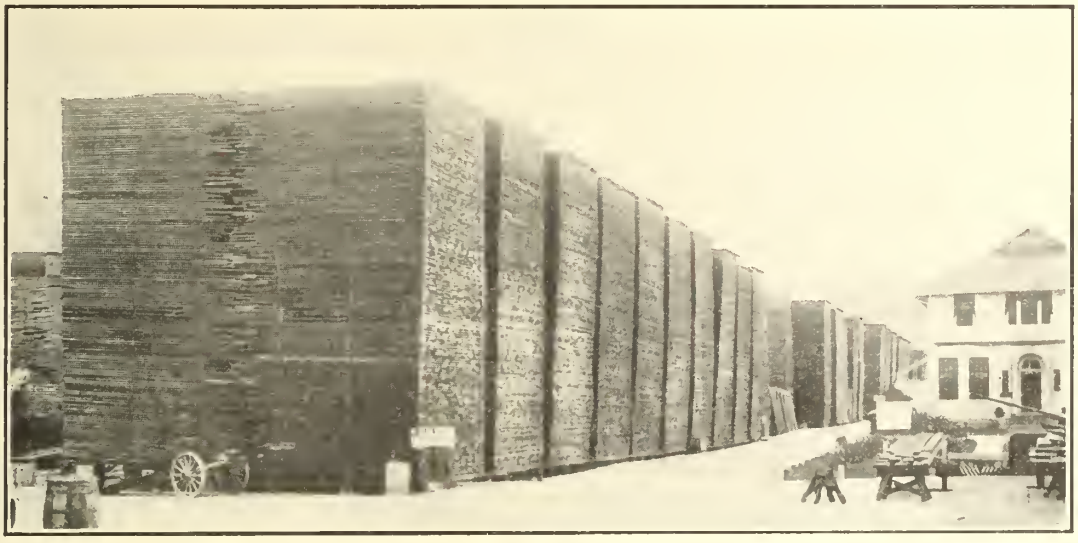
MAHOGANY



Rarely are such stores of precious wood to be found as may be seen in our yards. Across the seas from tropic lands it comes. From thick jungles where the light of day but dimly penetrates and where tangled native paths make difficult the bringing out of timber. Here the black man labors, risking life from jungle dangers, that supplies will not diminish and your orders may be filled.

Twelve million feet per year is the capacity of OTIS mills. An adequate supply is always on hand for prompt shipment. Get our prices.

"I Never Thought of That"

Many readers of the "Canadian Woodworker and Furniture Manufacturer" have written in commenting on the special "Modern Methods Furniture Number" just published. One of the letters received is published elsewhere in this issue. This is not reproduced because it says anything particularly nice about the paper, other than offering congratulations for a commendable issue, but because it contains a message for every executive in the woodworking industry. This message is summed up in the following sentence:—"While our department heads are subscribers, we see that each issue of the "Canadian Woodworker" is placed on our club room table for the special benefit of all employees, who look forward to reading every issue.

"Our department heads are subscribers." The best trade paper ever printed would be practically useless if it was not read by those for whom it was published and conversely the poorest one would serve some good service in proportion to the number who read its pages. The greater the number of readers a trade publication commands, the greater the benefits which are derived from that paper. This applies equally to the industry covered as a unit or to the individual organizations which go to make up that industry.

A concrete case, the woodworking industry of Canada benefits from the "Canadain Woodworker and Furniture Manufacturer" in direct proportion to the number of readers this paper reaches. The individual woodworking plant benefits according to the number of readers found among its employees. Before a woodworking organization derives full value from the "Canadian Woodworker," the paper should reach the purchasing agent, the factory superintendent and each foreman, in addition to the management. In some of the more progressive plants this complete distribution is secured through the management subscribing for those who are most interested.

The "Canadian Woodworker and Furniture Manufacturer" is published solely in the interests of its readers. Its appeal is directly to managers, superintendents and foremen. The information and articles found in each issue are selected or prepared because they are considered to be instructive, helpful and interesting to those in authority. If a reader desires information on any particular phase of his work or would like to see articles published on a certain subject, he has only to write in and within reason his request will be complied with as fully as possible. This is one phase of the service offered which is not fully understood. If data or particulars covering any phase of woodworking would be of service, it may have to do with organization, equipment, method or material, the request for such information will receive a welcome and will be given prompt, courteous attention. Often when this suggestion is made, the reply is "I never thought of that."

Another phase of trade journal work is co-operation between subscriber or reader and publisher. J. H. Baetz, retiring president of the Furniture Manufacturers' Association, in addressing that organization, stated that the day of selfish, individualistic effort is rapidly passing and the day of co-ordination of effort or co-operation has dawned. There is no better way in which this idea can be carried out than through the columns of your trade journal. Ideas, suggestions, constructive criticisms and expressions of opinion made in this way have the widest possible circulation, reaching practically all who are interested, and thus the greatest amount of benefit is secured.

The old prejudice against giving out information has almost entirely disappeared. To-day practical men are willing to give freely of their experience. This is only as it should be for we no longer live to and for ourselves alone but are interested in helping the other fellow. To advance this attitude still further, the next logical step would be for every woodworker to take an active interest in the "Canadian Woodworker and Furniture Manufacturer" and voluntarily send in ideas and suggestions, vieing with each other in keeping the reading columns of your paper brimful of bright, practical ideas. In this event the truth of the parable about "casting thy bread upon the waters" would be demonstrated. Ideas can be given and at the same time be retained and used, and if this practice were to become general, where one idea is given hundreds would be received. A greater measure of co-operation between reader and publisher would prove of untold value to the whole woodworking industry. Are you willing to do your share?

Are You Prepared for Increased Business?

Vancouver Firm Equipped and Organized to Take Care of all Orders which Offer —Prepared to Cut in Lots of One Thousand—Large Stock of Milled Parts Kept Ahead—Find Business Improving

By Geo. S. Perry, Vancouver Editor

If and when, as a famous western politician used to phrase it, general business conditions return to a state of pleasing and wholesome activity, there is one manufacturing institution in the Pacific Province, which will be ready to take on all comers for furniture orders. When the management of the Restmore Manufacturing Company laid plans to expand with the upgrowth of the western provinces of Canada, and in particular the cities and communities located in British Columbia, they prepared for quantity production on a scale seldom exceeded in the manufacture of furniture. The company had an eye to the thousand towns on the western prairies where furniture stocks are carried, as well as to the British Columbia field. As one of the principals remarked: "We would rather make a thousand run of one line, than a hundred, and we are prepared for it. But we must get freight rates adjusted, and that is coming. When it does, and business becomes generally active, we will have the equipment and the facilities to meet the change."

"Our Department Heads Subscribe"

Owen Sound, March 1st, 1922.

Editor, Canadian Woodworker,

We are just in receipt of the "Canadian Woodworker and Furniture Manufacturer" (February issue) and you are to be congratulated on this instructive volume. While our department heads are subscribers, we see that a copy of each issue of the "Canadian Woodworker" is placed on our club room table for the special benefit of all our employees, who look forward to seeing every number.

Yours very truly,
North American Furniture Co., Limited.

Carry Milled Parts in Stock

"At present we make in hundreds, and often do not set up more than fifty at a time of any line. This is especially true in "case goods" for we lack sufficient storage space. But we are ready to set up fifties or hundreds because we carry the milled pieces in stock in thousand and five thousand lots."

Specializing for the past year in furniture made almost exclusively from native broad leaf maple (acer macrophyllum) the company has extended and improved its plant and premises to handle the product from the log, which is shipped in by rail, to the finished article of furniture shipped out crated, or loaded direct into a car at the factory siding. From the small saw mill at the rear of the plant, where the maple logs are sawn, the lumber is sent to be piled, or else put directly into the dry kilns. When seasoned the maple boards go to the milling floor, where planers, moulders, re-saws, lathes, and other machines operated at high speed, put through immense numbers of finished sections for every line that is turned out. From the milling floor stock is sent to be piled in storage space on the second, or assembling floor of the factory. It is here that the output of the factory can, if trade demands, be increased up to the capacity of the space available for men to work. As stated, the factory runs at the present time are usually fifty or one hundred. As one lot of dressing-cases, sideboards or stands is put together it passes either to the finishing floor, or to the top floor to be stored. If required for immediate deliveries a lot is finished at once. If not it is stored in the white to be drawn on as finished stock goes out.

Increases Efficiency of Service

Similar methods of organization apply in the steel bed factory and in the spring and mattress department. Steel blanks ready for making up in each style of steel bed, are carried in stock in large quantities. In the spring department, the plant as at present equipped can turn out from 100 to 125 coiled wire springs and from 150 to 200 woven wire springs per day. An equal number of Restmore mattresses can also be made daily. The result is that no matter what sort of an order comes in, whether for an assorted car-load or two items, the factory can meet the demand in the briefest possible time limit. Naturally the fine upholstered work is not organized on the quantity basis as the rest of the plant. This department devotes itself to every detail of upholstery and decoration including draperies and curtains.

During the year, the Restmore company has added to its manufacturing plant a double-end dovetailing machine, by which four pieces can be machined at one operation, thus virtually making a complete drawer in one operation. Anticipating brisker demand larger storage space for piled lumber has been secured adjoining the factory, an area over 175 feet wide being added, and this the company is now engaged in filling as it was originally tidelands. Compared with conditions a year ago demand has been surprisingly good, and rail and boat shipments both in car and l.c.l. lots have shown steady increase. The factory is operating with more hands than at this time twelve months ago.

Do You Believe in Future of Canada?

One of the largest and most conservative financial institutions in the U. S., is responsible for the following optimistic expression of opinion:

"We believe profoundly in the future of our country; nothing but blindness could suggest that our prosperity will not be greater than before. It requires little optimism to feel that the worst is past and that we are engaged in reconstruction. There should be early improvement ahead for those who have courageously put their houses in order and who are ready to pay by effort for their success.

"The times demand effort, not inactivity, but effort tempered by caution and guided by an appreciation of the conditions that now confront the world."

What to Do if You Want to Make Bigger Profits

First of a Series of three Articles Dealing with the Organization and Management of Woodworking and Furniture Plants

By L. G. Cattermole, Chief Industrial Engineer*

The woodworking industry has suffered, in the main, from a lack of legitimate profits, as we all know only too well. Mr. C. M. Bigelow, in his book "Installing Management Methods in the Woodworking Industry" has ascribed this in no small part to the lack of technical ability and trained leadership. Owners and managers in the industry, however, have ascribed the lack of trained ability to the fact that sufficient remuneration has not been available to reward it. Certain it is that had modern management and production methods been applied to this essential industry, a great many plants would be enjoying, now, much greater profits than they had ever dreamed of and the workers (than whom a finer group of skilled artisans does not exist) would be enjoying a much higher scale of wages than the comparatively small wages they are now, in a great many cases receiving.

A Few of the Features:

Standardization of parts and product.

Layout of machines and equipment.

Development of accurate costs.

Definition of manufacturing policy.

Provision for future expansion.

This article, while necessarily brief, must touch on various fundamentals relative to maximum production in the woodworking industry, in other words will emphasize the important elements in "organizing for work," as H. L. Gantt so aptly expressed it. A few pioneers in this industry have led the way, but there are still a large number of plants, which, by a knowledge of facts, and the developments of the proper methods and organization to take advantage of these facts, should show increased profits, better wages for the men, and a lowered selling price—bringing the product within the reach of a much larger circle of prospective customers.

There are, in general, two methods by which a plant can plan to obtain a high degree of effectuality. The first is by developing within the organization itself, modern production methods. The second is by retaining an outside firm of engineers, experienced in the particular industry, and skilled in the rapid installation of modern methods, to work with the plant organization. The first method is a good method, and far better than no method at all; but the experience of broad-minded managers and engineers over a long period of years, has proved that it is not so productive of results,—does not so nearly attain the 100% desired, as the second method. The reason for this is that a plant organization has a narrower vision, its experience does not cover so wide a field, and its ability to instal modern production methods is problematical. In the long run, setting the cost of one method against the cost of the other, it will unquestionably be found cheaper to have professional engineers perform the work, as they have been trained in the securing of results in the least possible time. A small plant which cannot afford the services of a resident engineer can often secure desirable results by securing advisory service of competent industrial engineers.

The competent engineer, in planning the development of improved methods for a plant, is guided by several elements of extreme importance—namely, simplicity, commonsense, practicability and local conditions. For that reason it is essential that he should have a sound knowledge of, backed by years of experience in, the woodworking industry.

It must be remembered that no single prescribed method of procedure can, in all cases, be adhered to. In general the main features covered are as follows, (not necessarily, however, in the order mentioned) each of which will be outlined in detail: 1. Classification and standardization of product, operations, machines, etc. 2. Layouts of machines and equipment, changes to conform to the best methods of routing; and to supervise the actual changes. 3. Compilation of all vital records relative to the manufacture of the product. 4. Inauguration of time study. 5. Installation of stores for shaped stock, part stock, patterns, templets, tools, jigs, etc. 6. Standardization. 7. Development and inauguration of planning methods. 8. Installation of wage incentive. 9. Development of correct cost methods. 10. Organization plans. 11. Final definition of manufacturing, sales, and financial policies. 12. Plans for future expansion.

It has been remarkable to note, in instance after instance, a complete change on the part of an organization, from the old time "let well enough alone" attitude, to an aggressive, fearless, conservative, fair and just attitude after the adoption of modern methods. Certain it is that fairness and justice cannot be administered without a knowledge of facts. Stiffening of the moral fibre, the "backbone" of the organization, must, however, come with the improved methods—as improvements in the mechanism of the organization will never take the place of the personal element, although increased broadness of vision comes from the new viewpoint.

For the purpose of analysis, to establish the most effective routing procedure, it is necessary to classify the product and operations. As this knowledge is compiled, it is posted onto "Layout Sheets," which are later used in the planning of work through the shop, and the making of instruction cards for the workmen. Symbolizing, or numbering, of parts and

*Cooley & Marvin Co., Chicago

operations serves to simplify and minimize clerical work.

The utilization of standard parts in various items of product, when done skillfully, lessens the cost of manufacture, without in any way "cheapening" the product. The designer should work in very close contact with the shop on this matter. There seems to be very little justification in having drawer sizes in a case-goods factory vary by one-quarter, three-eighths or one-half inch, or stretcher sizes in a chair factory vary by one-eighth inch in length. Such lack of standardization adds considerably to the cost, and it is doubtful if, in any manner whatsoever, it adds to the value of the product.

The standardization of operational sequence on various items of product enables the work to travel through the plant without "back-tracking," thus avoiding congestion, and facilitating the speed of manufacture. Some furniture manufacturers, whose routing problems have been particularly bad, have had the manufacturing cycle, or time-in-process of an order, cut from eight or nine weeks to six or seven weeks through the application of practical, operational-sequence procedure.

Layouts of Machinery and Equipment

After the above-mentioned operational sequence has been determined upon, it is necessary to make layouts of the machinery and equipment to conform to the same. This is generally done by the templet method—that is the cutting out, to scale, of all machines and equipment, and arranging them on the floor plans of the building to secure the maximum effectuality. This is, in itself, no small task, and calls for all the knowledge and experience of everyone who can shed even the smallest amount of light on the subject. It is desirable, as soon as these layouts have been completed and approved, to have the actual changes go forward as soon as possible, so that no delay will be occasioned when the installation of the wage incentive is started.

The problems of layout in a woodworking factory are peculiar, in a great measure, to this industry alone. The layout of the yard for the proper storage of the lumber; the location of the kilns with respect to the yard layout and the mill; the layout of the cutting room with proper cut-off equipment and sufficient storage space for cut stock; proper parking space for trucks of work-in-process; the development and layout of the most effective methods for driving-up or assembly; the development and layout of the equipment for the most rapid and highest quality application of the finish, and its drying, as well as rubbing; are all problems of considerable magnitude. The resident engineer should be experienced with the various processes involved—otherwise considerable time will be lost in familiarizing himself with the same.

(Continued in April Issue)

Can Furniture Sales Be Increased?

Other Industries are on the Aggressive, What is the Furniture Industry Going to do to Get a Fair Share of the Spending Money of Canadian People—Furniture is not Sold When Shipped to a Dealer, it is only Crowded in the Channel of Distribution — Public Demand the Final Outlet

By T. Lyle Blogg

In the brief history of the Home Furniture Bureau a number of valuable facts, which the furniture industry would do well to contemplate and act upon, have been revealed. Our initial advertising campaign, which ran during the fall of 1920, was heralded in both Canada and the United States as the most forward step that the furniture industry had taken in many years. Great things were predicted for the future of the industry if this sort of advertising was persisted in and other logical means of propaganda exploited as time went on.

The furniture trade of Canada welcomed as a substantial sales help and a bid for future co-operation, this great campaign. And after it had been in progress but a few weeks, letters from the leading furniture dealers of Canada arrived in every mail, congratulating us on our splendid vision and telling of the great interest that had been created with the buying public.

Furniture Dealers Won Over

Every encouragement was offered to the dealers to exploit the campaign locally in every way possible. The newspapers caught the spirit of the campaign itself, and succeeded in getting dealers to run extra quote a big dealer in one of our Western towns, "On advertising of their own, offering good furniture and furnishings—the necessary materials from which a better furnished home must be created. Dealers adopted for their own use the campaign slogan,—"Better Furnished Homes Mean Greater Happiness," and they dressed their windows frequently and in good taste. The result was that the very spirit of the campaign pervaded the community, and furniture became a topic of conversation in the homes, on the street and in the circles of society.

Resulting from this aroused interest more furniture was sold than had ever been sold before. To the day after your recent advertisement appeared we had several customers tell us that they had been influenced by this publicity, and we had a day's business considerably over the average." One Regina newspaper wrote us that during the first weeks of our campaign they carried more furniture advertising than they had for years, and they held the record for this district. This great increase they attributed to the impetus given furniture selling through our Better Furnished Home Campiagn.

Felt the Need of Assistance

After the advertising had been in progress some time, the dealers seemed to be awakened to the possi-

ble market that could be created for furniture, if only they would exploit it. Then this bureau received many requests from dealers for smart newspaper cuts, booklets on furniture and room arrangements to give to their customers, also practical information for their salesmen. They deplored the lack of original ideas for their window displays and asked the bureau if we could not help them. They also sought assistance with their copy, and expressed a wish for a service of interior decoration, so that they could offer their customers a complete service on the re-furnishing of an entire room or a whole house in all its details. In fact, we had the furniture dealers of Canada on their toes, straining at the leash to get after the business that only needed getting after to make sales.

We were able to satisfy but a few of their many requests, and assured them that we were just getting under way, and would later on expand into these many other activities and co-operate with them, in every way possible, to bring the furniture industry into its own—to make better furnished homes a topic of every day conversation, and good furniture "the thing."

This new interest of the dealer had its reflection in the newspapers of the country in which we were advertising, and requests began to come in for helpful, practical articles on furniture and furnishing, for inspirational articles on the history and romance of furniture and for good illustrations suitable for newspaper work, showing attractive rooms for the entire house and for houses of different sizes. Again we were obliged to procrastinate and promise material a little later, and expressing our pleasure at their willingness to co-operate.

One Thousand Requests Received

Business conditions changed, the slump hit us, but after a steep up-hill fight by the champions of the cause we succeeded in getting another Better Furnished Homes Campaign under way in September 1921.

This time we used twenty-six advertisements, each showing an attractive room, furnished with Canadian made furniture. These twenty-six room scenes were then published in booklet form and offered to the public through our advertisements at 10 cents a copy. The results of this step in a two months campaign was a thousand requests for this portfolio, each request accompanied by 10 cents. Practically every request was also accompanied by a letter, often short and to the point, but of the thousand letters received the majority of them indicated a thirst for knowledge on the subject of home furnishing and furniture. Many professed their ignorance and surprise to learn that such attractive furniture as was illustrated in our advertisements was being made in Canada. They wanted our portfolio, often enclosing 20 cents and the address of a friend to whom the portfolio was also to be sent in order that they too might learn of this new found Canadian product. One man, a Montreal lawyer, had just built a new house, and confessed that he had planned to buy all his furniture in the U. S. A. but having followed our series of illustrated advertisements, had decided to buy in Canada for this new home, and for all his future requirements of furniture. He didn't know that there was any real furniture made in Canada—and after all how should he know?

Some people sent in diagrams of their rooms and a list of furniture which they had, asking for a good arrangement. Many times the actual advertisement which prompted the inquiry was taken from the newspaper and enclosed with the letter, and it is interesting to know that we have received practically every advertisement in the series at one time or another. This shows that all classes of people were interested in our campaign, as some of the furniture we illustrated was of the simplest design.

The response from dealers from this second campaign was not as large as from the original one, but nevertheless many letters were received, most of them expressing the hope that the campaign would be continued as it was beginning to have a favorable effect on the sale of furniture.

Considering Future Activities

Our second campaign is over, and we are now considering ways and means for our future activities. The question comes up "Is the furniture industry to stand still and allow the retail tarde to create the market for the class of furniture that is most easily sold and gives the best profits, or is the industry going to be master of its own destiny, create its own market, and educate the people to honestly made, well designed, but not necessarily costly furniture.

The unbounded faith that many of us have in the future of the furniture industry is going to carry this great home movement on and on to its full success, and by so doing render a commercial service to ourselves, a benefit to our fellow-men and a patriotic duty to our country. For "no nation can rise above the level of its home life."

In the throbbing life of Canada no industry has greater potential possibilities than the furniture industry, for the subject of home furnishing is one in which everybody is interested or can be interested. It has been well said "a home, be it nest, cave, tent or house, is the goal of every living thing." That spirit is latent or alive in all of us, and it is the human instinct that the furniture industry can arouse interest, develop and educate in the next ten years and bring the industry to the thoughts of people and into the everyday conversation of the nation.

Just so Much Money to Spend

Considered nationally, the people of Canada have so much surplus money to spend after they have provided for their food, clothing and shelter. The problem before the furniture industry is to get a liberal share of that surplus money. Get it in the face of stiff competition, from the industries marketing automobiles, furs, diamonds, clothes, jewellery, electrical appliances and a score of other things that it is possible to do without. These other industries have forced their way to the front from well planned and persistent advertising and propaganda work carried on over a period of years.

We are inclined to think that furniture is sold when it is sent to a dealer. It is really only crowded into the channel of distribution, and the dealer who gets it must sell before he is in the market again. The intensive selling that we sometimes do is but to the dealer and is only blocking the channel of distribution. Public demand is the final outlet, and the furniture industry must develop that outlet into a steady all-year demand by educating the public to what is good taste in furniture and by impressing upon them the educational influence of proper environment on the character of the rising generation, and making up

to-date well made furniture as much to be desired as up-to-date clothing.

Co-operation All that is Needed

As a closing thought, we have every reason to be proud of the furniture industry of Canada considered internally. Our factories are well equipped, our furniture is attractively designed and honestly built. It is well finished and efficiently crated. The price asked is in harmony with the times and it is usually shipped promptly and then forgotten so far as the industry is concerned.

The furniture industry of Canada should resolve to get some of the fruits of advertising and propaganda work that have been obtained and are being enjoyed by such co-operative organizations as the Indiana Limestone Ass'n; California Raisin Ass'n; The Metal Lath Mfrs.; The Red Cedar Shingle Ass'n; The California Fruit Growers; The Birch Ass'n; The Walnut Growers Ass'n; The Associated Tile Mfrs.; The American Walnut Ass'n; The Gum Association; American Face Brick Ass'n; American Hollow Tile Ass'n; The Cypress Ass'n; The Arkansas Soft Pine Ass'n; The Prune & Apricot Growers Inc.; The Oak Flooring Mfrs.; The Wallpaper Mfrs.; The Common Brick Industry; The Mahogany Ass'n, and many others. Everything to build and finish a house—everything but furniture. Are we going after the business as an industry? BETTER FURNISHED HOMES MEAN GREATER HAPPINESS.

New Woodworking Organization

One of the newest additions to the woodworking plants of Toronto is that being constructed by the Meyers Lumber & Mfg. Co., Limited. This concern was recently organized with W. J. Meyers as president and W. Warren, managing-director. They have secured a six-acre site on the old Belt Line midway between Spadina Ave. and Bathurst St. Their plans call for a two-storey factory 68 by 80 feet, with separate office, storage sheds, stables, etc. A modern dry kiln will be put up. The lower floor will be equipped as a general planing mill and breaking-out department, while the upper floor will consist of a sash and door and woodworking plant. In passing it might be of interest to mention that trussed roof construction will be used doing away with all posts in the second storey. They intend to specialize in interior trim, flooring and table millwork of all kinds, as well as cater to the general lumber trade.

The equipment as planned is as follows:—swing cut-off; power feed rip; band resaw; double surfacer; chain mortiser; tenoner; sash and door sticker; hollow chisel mortiser and relisher; three-drum sander; drum and disc sander; belt sander; band saw; ball bearing shaper; boring machine; grinder; pony planer; variety saw; rip saw; cut-off saw. The drive will be electric. The equipment is to be arranged in groups and each group will be driven by a separate motor.

W. Warren, the managing-director, has had many years of experience in the retail lumber and general woodworking field. For many years he was with Cushing Bros. & Co., Limited, of Calgary, and more recently was manager of the West Toronto yard of the R. Laidlaw Lumber Co.

"Create consumer interest for the dealer, by working, for the interests of the consumer."

Toy Exhibition at Toronto

The toy fair held recently at the Queen's Hotel, Toronto, attracted hundreds of buyers from all parts of the Dominion. After a review of the articles on exhibit one can hardly help but be convinced that the Canadian toy industry has made great progress in the last decade, taking full advantage of suspended importing from Germany. However German toys are reappearing again in large quantities and are apparently able to undersell the Japanese manufacturers who have, in the past five years, exported large quantities of toys to Canada. Canadian toy makers of, especially the heavier lines such as wooden baby carriages, kiddie cars, wagons, cradles, automobiles, etc., are meeting with ever growing success, many original and attractive articles being displayed. Perhaps the most elaborate exhibit in the wood line at the Toronto toy exhibition was the display of two sets of enamelled nursery furniture by the Alliston Wood Products, Alliston, Ont. These pieces were made of basswood finished in blue and pink and were the object of favorable comment among the visiting buyers. Other attractive displays were the Earlscourt Toy Works, the Kiddie Kar exhibit, the Gendron carriage and wagon showing and the excellent work of the Vetcraft people in wood and metal.

The following figures for the eight months ending November 1921, give total value of toys imported from Japan and Germany:

	1920 (8 mos.)	1921 (8 mos.)
Other toys, Germany	$166,577	$59,529
Dolls from Japan	416	32,148
Dolls from Germany	248,921	110,039
Other toys, Japan	4,117	126,561

Fire Losses For 1921

The sum of $5.52 per capita is the amount of the fire loss chargeable to every man, woman and child in Canada for 1921, or a total of over $45,000,000.00. In spite of fire prevention propaganda carried out by various organizations, the losses from fire seem to be increasing from year to year. In 1919 the figure was, roughly, $25,000,000.00, 1920, $28,000,000.00 and in 1921 $45,000,000.00, an increase of approximately 60%.

A deplorable feature is that the greater part of this loss need not have occurred, for simple precautionary and preventative measures would have reduced the loss in many cases if they would not have prevented it altogether. When we consider that the per capita loss in Canada is the highest in the world and is nearly six times as great as the per capita loss of Great Britain, we are forced to the conclusion that Canadians are not as careful or as progressive in regard to fire and fire prevention as the citizens of other countries.

As the total fire loss of Canada climbs, so the proportion of the loss borne by the woodworking industry grows in proportion. From the viewpoint of fire, woodworking is a hazardous occupation as fire hazards exist on every hand. Such simple precautions as orderliness and cleanliness of plant and surroundings, coupled with fire-fighting and prevention equipment, will do much toward reducing the fire loss borne by those in the woodworking field.

"To stop advertising is to stop greeting old friends and to stop making new ones."

"Send Me Everything for My House"

Western Woodworking Organization Carries Complete Line of Building Supplies —Had Small Beginning in Tent 16 Years Ago—Present Plant Modern and Complete in Every Detail—Use Plan Book and Catalog to Create New Business

By E. H. Chapman, Winnipeg Editor

The present huge business of the Hayward Lumber Company Limited saw commencement in a tent at Vermilion, Alberta, in 1905, when G. E. Hayward, the president of the company, first laid the foundation of a business which following the advice of the late J. J. Hill "Came West and grew up with the country." After eight months under canvas a wooden structure was erected and the tent abandoned. Much

G. E. Hayward, Edmonton, Alta., President, Hayward Lumber Co. Limited

of the prosperity which the company enjoys is due to this factor; that the originators advanced with the settlement of the west, and were in a position to understand the demands of the people and supply them. At the present time this progressive organization is operating branches throughout alberta.

The parent plant at Edmonton is one of the most modern and best equipped factories of the kind in the west. This has not been accomplished without considerable effort and sacrifice. It has taken close application and persistent effort to reach the present standard, and possibly the principal to which can be attributed the rapid growth is the fact that the methods of doing business followed, have appealed to the buying public; their policy always being one of honesty and straight-forward dealing in the merchandising of their goods—has always in fact, been one of giving "Quality and Service" (the motto which they have now adopted as their slogan.) A business founded on these ethics is sure to succeed. Since the commencement of the Hayward history it has been their opinion that satisfying the people who needed homes and buildings was the main thing, and though dollars and cents were held in considerable regard the greatest consideration, was "Quality and Service," and it is on these principles that the Hayward business is conducted.

Found Larger Plant Necessary

In 1915, what is known as the old plant, was purchased from the official assignee of the Northern Lumber Company, which concern was in liquidation. Following this movement in the spring of 1916 the head office was moved from Vermilion to Edmonton, it being recognized that they would have more scope for extension and development in the capital City.

Due to tremendous increase of business in 1919 it was found that with the facilities at hand it was impossible to cope with the business, and a larger plant was decided upon. With this idea in view an entire block adjoining the old property was purchased and additional siding accommodation was arranged for with the railroad company. Early in May 1920 a fine new pressed brick building commenced to rear its head skywards. The main building is two storeys high, 162 feet by 66 feet all being of pressed brick with steel sash, wired glass and fire proof doors. The building is steam heated and all modern plumbing, while the fact that it is as nearly fire proof as practicable, makes a large saving in the way of insurance premiums.

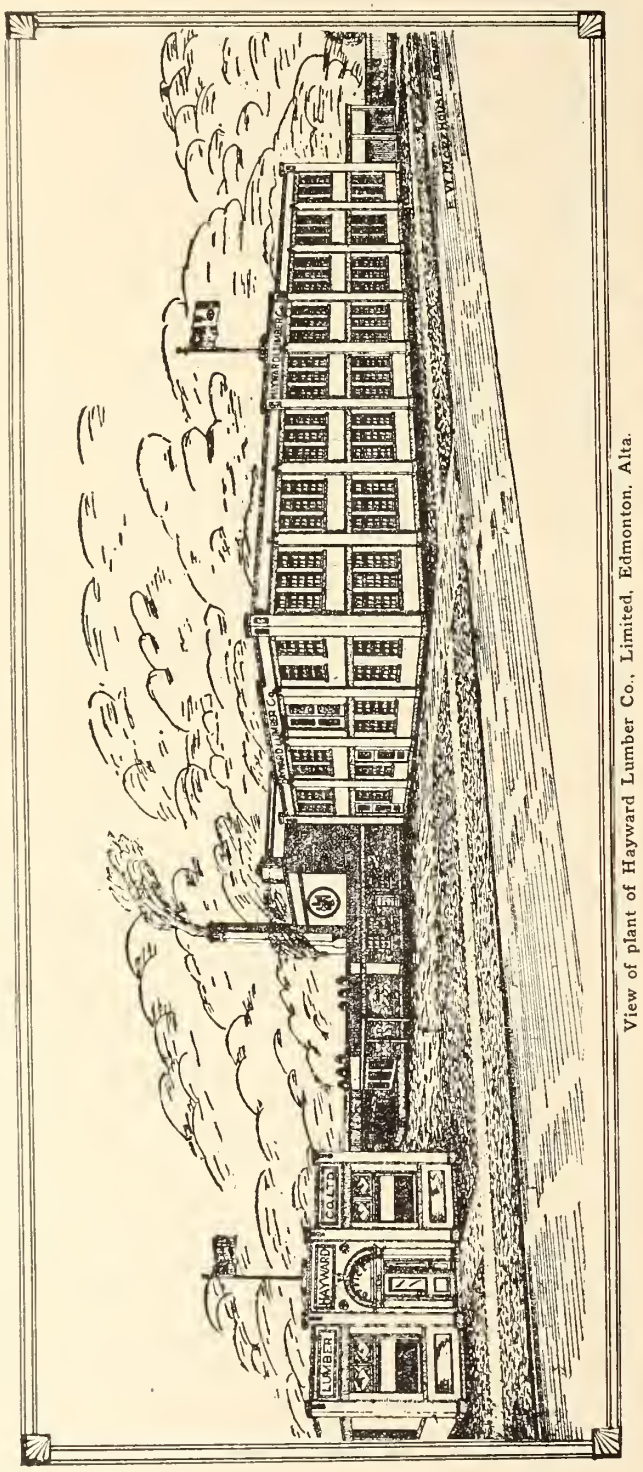
New Plant Thoroughly Modern

At the present time the factory is busy; the planers, sanders, rip-saws, and other wood-working machinery filling the air with their song of industry. the equipment is most modern; all the drive is overhead which makes for convenience, and safety for the workers, and the entire plant is operated by electricity, individual motors supplying energy for each machiine. A suction system is connected with each unit. This is operated by a 60 horse-power motor, and is effective in keeping the machines and the building clear of sawdust and shavings, which are later elevated to the top of the building, the air extracted, and the material fed to the boilers which supply the necessary heat for the drying kilns. A noteworthy feature of the factory is that it is flooded with light from windows in all directions, which makes for better working conditions and the turning out of quality goods.

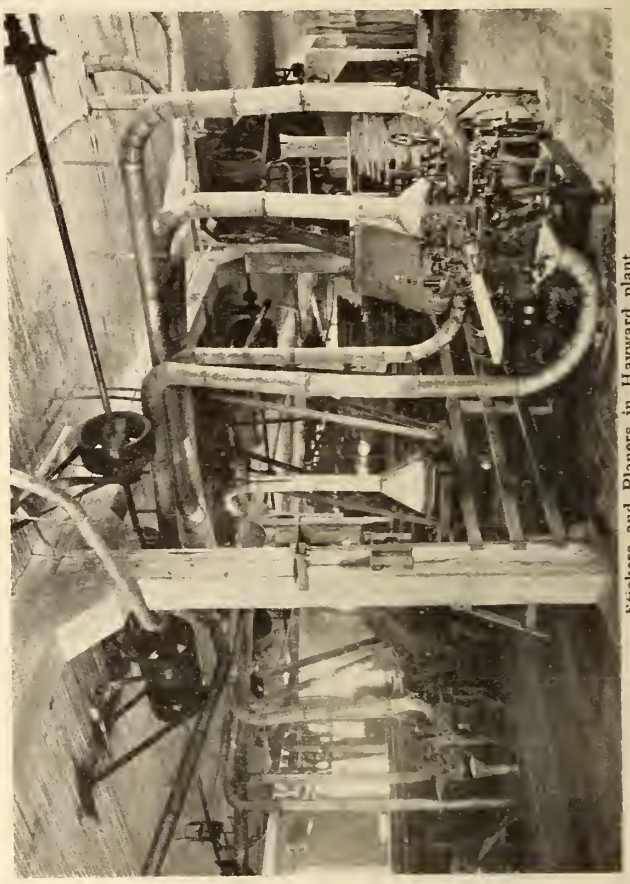
A complete saw filing and machine room in maintained where all necessary repairs and alterations are made for the numerous machines, and in addition to the floors devoted to the many varieties of wood goods which the Hayward Lumber Company turns out, there are separate departments for glazing, glueing, and erecting, as well as glass and packing rooms.

Sash, doors, and all interior finish is being turned out in large quantities, not only for the Company's branch yards, but these goods are being delivered throughout all the Northern portion of the province.

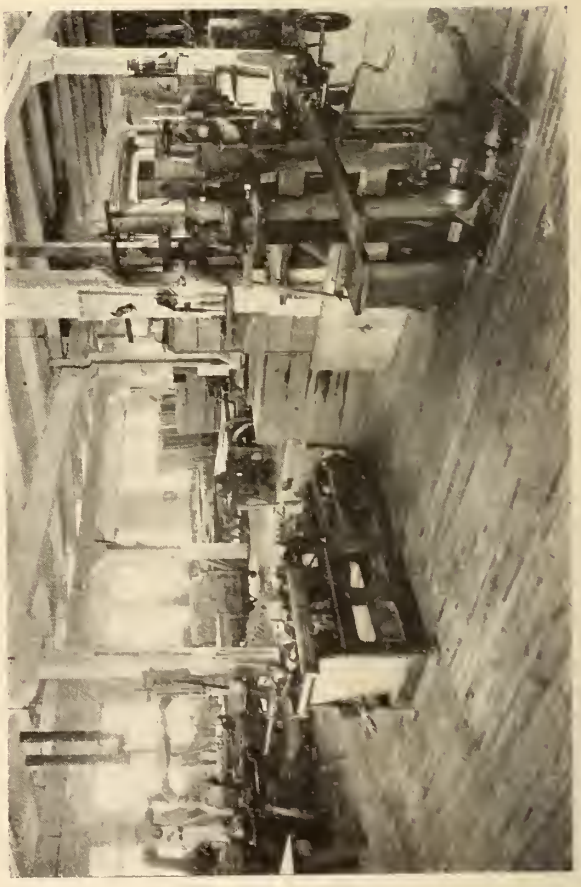
The plant is equipped for making all classes of mill work, store fixtures, office equipment, including



View of plant of Hayward Lumber Co., Limited, Edmonton, Alta.



Stickers and Planers in Hayward plant



Scene in sash and door department

special house and office cabinets, etc. Builders' supplies are also handled, and every requisite for a building can be obtained from the Hayward Co., from the interior finish to the paint for the exterior finish. All that is necessary is to say "Send me everything for a house of such and such a plan, or for a fixture of such and such a design," and the Hayward Lumber Company will do the rest.

Lunch Room For Employees

The saws, framing machines, planers, stickers, boring machines, lathes and re-saws occupy most of the main floor, the machines being footed in concrete. On this floor there is also a lunch room for the accommodation of the employees. On the second floor, which is especially constructed for strength, with laminated flooring, are saws, shapers, tenoners, stickers, panel raisers, band saws, clamps, triple-drum sanders, planers, rip-saws, trimming saws and jointers. There are specially fitted benches on this floor flooded with light so that the most intricate fitting can be accomplished under natural conditions. An electric elevator maintains service between the two floors, this being of sufficient capacity to handle loads of lumber in full lengths.

The power house is constructed of solid brick and concrete, fitted with a fireproof shavings vault 16 feet wide by 30 feet long, with a depth of 26 feet. By the utilization of the shavings for fuel the company is enabled to operate the large drying kiln at a low cost, this latter being the most modern of the kind west of Winnipeg. This is known as the Grand Rapids Dry Kiln and by its use the firm is able to guarantee any special work to be free from shrinkage, checking, etc., and enables them to turn out show cases, store fixtures,etc., which are the equal of and imported from Eastern Manufacturers.

The old factory buildings are being used at present for storage and warehouse purposes, and although totally eclipsed by the new brick structure, they are, nevertheless, equally as good as the ordinary run of lumber constructed factories, and have a large capacity for storage purposes, where the lumber is kept out of the weather and is ready for immediate use.

Have Catalogue and Plan Book

In addition to the city business and trade radiating from the local yards of the company, the wholesale business has been greatly extended, due, in great measure, to the modern manufacturing plant which they now operate. Orders are now being shipped to British Columbia on the West; as far east as the Saskatchewan border; south to Calgary; and as far north as habitation extends. The company have not only a catalogue, but also a series of illustrated plan books outlining designs for dwellings and farm buildings. The houses shown are specially suitable for the West, and the lumber, interior finish, nails, locks, paint and every requisite for the building is furnished by the Hayward Company complete. In addition to city and farm homes the Hayward Company, recognizing what the future of the dairy industry means to Northern Alberta, are also handling a new form of silo, which will insure soft feed for the milk producers the year round. This silo is specially designed to meet the requirements of the Northern climate, and the company is looking forward to supplying many farmers with these valuable revenue producers.

The general condition in the rural districts is much more satisfactory at the present time, says Mr. Hayward, than what he anticipated a month or so ago, while conditions are looking very favorable for the year 1922. Prices of lumber, have reached normal level, and big things in the way of improved farm and city homes are looked for in the near future.

G. E. Hayward is president and general manager of the company, and John Henning is Secretary-Treasurer.

How Low Does Your Competitor Figure?

One Woodworker Thinks He can Make Thirteen Sash and Frame for $84.00—How Does this Compare with Your Figures?—Possibility of Error in Calculating and Applying Waste—Cost Estimates Vary 80 per cent

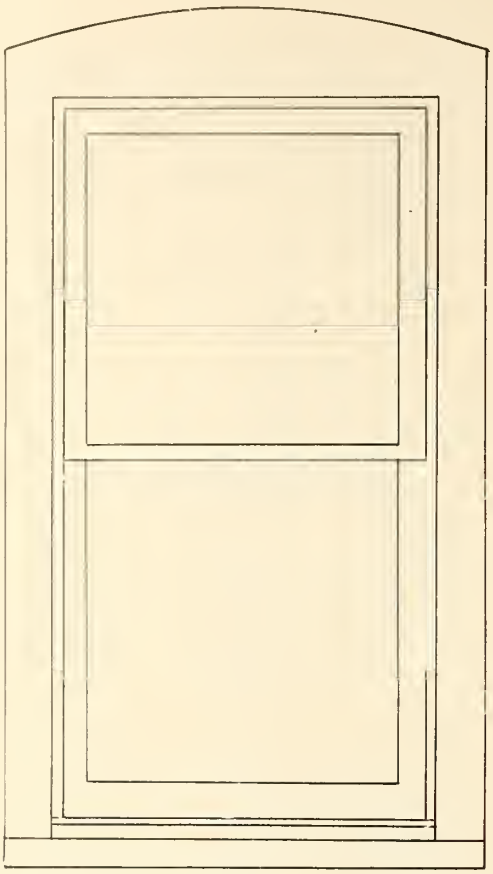
The article dealing with sash and frame costs was practically crowded out of the February "Canadian Woodworker" on account of the special nature of that issue. Judging from the letters received from readers, these articles are arousing a considerable amount of interest in woodworking costs, and as a result are bound to have a beneficial effect. As many have requested that other articles be published these cost studies will be continued in the next few numbers.

While the response provoked by the articles which have appeared has been highly gratifying, the amount of co-operation which has been forthcoming, has been disappointing. Even among those who have written in expressing their interest and appreciation and asking for information with regard to various phases of the figures published, there has been a marked disinclination to co-operate and submit cost figures. This should not be so. The curse of the woodworking industry is the blind, ignorant competition so often encountered, and any movement tending to ameliorate this condition should have the hearty, active support of every progressive woodworker. It may take a little time to figure out and submit a cost estimate but, in doing so, one has the satisfaction of having done something to improve conditions in one's chosen industry and to improve the competition with which one is confronted.

Different Ways of Figuring Material

The subject this month is 13 frames and sash, as shown in the accompanying sketch. This study is a little more complicated than those which have been covered. For this reason it is not possible to compare some of the details as on other occasions. Take the question of material. Some figured the whole job on a feetage basis while others figured certain parts as so many feet and the remainder on a lineal feet basis. That being the case, there is no common ground for comparison purposes. Some woodworkers run quantities of standard pulley stile stock, casings, parting strips, etc., and charge such material

against each job at a price per lineal foot, which covers overhead and wastage.



Box frames and sash—13,—3′ 6″ x 6′, 1¾″ 2 light sash, brick opening, cambor head

Cost Estimates Submitted

Estimate	Waste	Bench	Machine	Total
1	15	10	13	$ 84.40
2	10	12	16	87.32
3	10	17	10	92.30
4	20	22	18	98.20
5	17	18	16	107.76
6	10	26	52	118.17
7	20	30	20	119.76
8	**25**	**35**	**20**	**128.47**
9	30	40	24	133.10
10	10	26	32	138.65
11	15	18	40	151.80

Coming to the proper percentage of waste, the same old lack of uniformity is found. Of the 11 sets of figures submitted, four include waste at 10%, two at 15%, one at 17%, two at 20%, one at 25%, and one at 30%.. There is not the slightest doubt that 10% is too low. It is doubtful if there is any class of woodwork which can be made on such a small wastage basis. Box manufacturers are not hampered by such exactng restrictions as to quality of stock as is the millwork manufacturer, yet the average waste allowance in the box field is in the neighborhood of 17%. Judging from this fact alone, it is doubtful if any allowance under 20% will cover the waste on sash and frames. Again, experience has convinced certain woodworkers who keep close check on all materials coming into their plants, that this class of work should carry 20 or 25% waste.

How Waste is Calculated

Nothing is gained by making the waste allowance too low, that is, lower than warranted by the actual amount of lumber required. If the manufacturer figures 10% waste when it actually amounts to 20%, he is just kidding himself to the amount of 10% of his material costs, and his profit is just reduced by that amount.

There may be some difference in the way certain woodworkers figure waste. One reader wrote in, asking if all material is figured at actual cost with the waste added. The usual practice is to take the actual net feetage of material required to complete the job and then add sufficient allowance to cover the waste; for instance it takes 1,000 feet to cut the material for a job having a net feetage of 800 feet. It is evident then that the waste must be 200 feet. Now the way this is figured and applied makes a considerable difference in the waste allowance. On 1,000 feet a 200-foot waste is 1/5 or 20%. Figuring the other way—20% on 800 is 160 feet, giving a total of 960 feet and leaving 40 feet for which no charge or allowance is made. The correct way to calculate is 200 feet waste on 800 feet net requirement, or 25% on the net feetage. This gives the correct allowance.

To make a study of the time submitted is really amusing. One thinks ten hours should cover bench work while another guesses 40 hours is about right, or, again one lets the machine work go at ten hours while someone else maintains that 52 hours is required. In some cases the bench time figured exceeds the machine time allowed while in others the reverse holds true. Totalling bench and machine hours together, they read 23, 27, 28, 40, 48, 50, 55, 58, 64 and 78, a difference between high and low of 55 or nearly 300%. Comment here is unnecessary.

Who Makes or Loses?

The prices speak for themselves,—from $84.40 to $151.80, or nearly 100% variation. The difference in equipment, organization and methods found in various plants would preclude the probability of any two figures being identical, but such differences would not account for a variation of $67.40 on a job of this size. Either $84.40 is far too low or $151.80 is away high. Sash and frames might be termed an everyday commodity. Is the plant which works on an estimated cost basis of $84, $87 or $92, losing money on every order accepted for sash and frames?

This order called for 13 box frames, brick opening, 3′ 6″ x 6′ 1¾ inches, two light sash, 7/8 inches pulley, pulley stiles, 7/8 inch inside and outside casings, 1 3/8 inches hanging stiles, 2 x 6 sills, and cam-

Are the Figures Correct?

If you detect any errors or omissions in the detailed costs included in this article, do not hesitate to bring such inaccuracies to our attention. Numerous ideas and suggestions would be brought out if those who read this cost material were to send in constructive criticisms of the figures submitted. Let us hear from you.

bor heads. The cost submitted by the firm filling the order, shown in black in the list is $128.47, and is made up as follows: in the second cost shown all the material is figured on a feetage basis:

48 - 9"x9" PIGEON HOLES
6'-6¾"
4'-10⅜"
⅜" B.C.FIR SHEATHING
— SPECIFICATIONS —
CABINET TO BE OF BEST GRADE B.C. FIR DELIVERED KNOCK DOWN AND IN THE WHITE

Send in your estimate of cost on this simple job. One set pigeon holes in B.C. fir containing 48, 9" x 9" openings. Particulars on sketch

The cost study for April is a simple little job that is often encountered in the days' work—a set of pigeon holes containing 48 9" x 9" openings. The specifications as shown on the accompanying sketch call for B. C. fir, 3/8 inch fir sheeting for back, ends 1 1/8 inch, vertical divisions 3/8 inch and horizontal shelves 3/4 inch to be delivered in the white. Would it not be interesting if the April issue of the "Canadian Woodworker" were to contain 25 cost estimates each giving material, waste bench and machine time, and commercial burden? It depends to a large extent on you. Send an estimate in without waiting to be asked. It will be appreciated.

The slides of outside moulders should be cleaned and kept in a bright condition, so it is not too stiff, otherwise it is possible to strip the thread of the screw which adjusts the table.

If you have a lathe which is not working it is possible with a little ingenuity to make it do a great deal of useful work. A small emery wheel could be attached or a sanding wheel.

With some very cross-grain wood it will save a good deal of stock if the cutters are carefully fitted, and an operator who can recognise at a glance which way the grain of the wood lies.

Many a man has failed at saw doctoring because he has trusted to his hands instead of his brains. What is needed is, the technical knowledge about saws, skill, and plenty of common sense.

Can You Kiln Dry Oak in Seven Days

Speed of Drying Operations Important Factor but Drying Losses Must be Held Down at Same Time—Some Suggested Drying Schedules—How Maximum Results May be Secured

By P. E. POOLE

What are Your Drying Troubles?

The "Canadian Woodworker" would welcome an opportunity to assist you with your drying problems. In addition to being in touch with numerous dry kiln engineers, it is possible that some other reader of this paper has experienced and overcome the same troubles that are proving so annoying in your case. An outline of his experience might prove helpful. Just give a detailed outline of what you are up against, kind of trouble, species of wood, drying period, and temperature and humidity carried and if we can help you we will gladly do so.

Two phases of dry kiln work which should receive first consideration are drying lumber with a minimum drying loss from checking, warping, honeycombing, case-hardening,etc., and drying it quickly. Of the two it is not easy to decide which is the more important. While admitting the necessity for reducing drying losses to a negligible amount, yet the question of time must always be considered, as it is a determining factor in judging the efficiency of the drying operation. When the drying time is reduced to a very low basis and the drying losses held down at the same time as is the case with modern drying equipment intelligently operated, then and only then should one be satisfied with his drying equipment and its operation.

All too many woodworkers are experiencing considerable trouble from warping, checking and case-hardening, yet at the same time their drying periods are far longer than they need be, increasing the cost of the drying operation. Some few realize that their kiln-drying equipment or methods, perhaps both, are not giving the results they should, but others have not awakened to the realization of this fact and take their drying losses, high drying costs and vexatious delays as a matter of course.

What May Be Expected

Too much emphasis cannot be laid on the fact that it is possible and practicable to dry lumber in a kiln without any appreciable losses occurring from degrade or drying troubles. The proof of this is that many are doing it. One manufacturer writes,—"We are having absolutely no checking, warping or case-hardening, and the manufactured product is going through our finishing department under high temperature, (Probably meaning the varnish drying kilns.—The Editor.) with absolutely no warping. In addition we are convinced that other plants are not drying their stock any quicker than we are." It may and does require good equipment and intelligent operation, but satisfactory results can hardly be expected in any phase of manufacturing unless the equipment and methods are suitable.

Mention has been made of short drying periods. Are you able to dry 4/4 oak in six days? If others are doing this, is there any reason why you should not? If so, is it your equipment or the methods you employ, which are at fault? One manufacturer of dry kiln equipment is willing to give a written guarantee that his kiln, if operated in accordance with his instructions, will dry oak that has been on sticks for four months, in from six to eight days without warping, checking or case-hardening. This same time guarantee applies to walnut, birch, gum, chestnut and other hardwoods. Another manufacturer of dry kilns has found that fair average drying times for certain hardwoods are as follows:—oak 10 days, birch 9 days, gum 10 days, walnut 10 days, chestnut 10 days, poplar 7 days and maple 9 days.

Many Governing Factors

These are only average drying times, for there are so many variable factors, such as moisture content when entering the kiln, texture of wood, methods of operation, conditions in the kiln, the kiln itself, that it is impossible to give definite drying times. One set of drying schedules, which came to my attention recently, gave the following as fair average standards of performance:—hardwoods containing 15% moisture content, 7 days; with 15 to 20%, 8 days; 20 to 30%, 10 days; 30 to 40%, 15 days and 40 to 50%, 20 days. As stated above, owing to the many factors which enter into the drying operation, these times merely serve the purpose of giving an idea of what others are doing.

The Forest Products Laboratory at Madison, Wis., has issued drying schedules which are certainly on the safe side, that is, they have sacrificed time to secure safety. In actual practice their drying times can and are being reduced without any appreciable deteriorating effect on the stock. It might be of interest to include some of the figures, issued by the Laboratory, not because they may be taken as standards, but rather because they may be used as a maximum guide, that is, unless you can reduce the drying periods as given by Madison and at the same time dry your lumber without any loss from checking, etc., your kiln and your methods should receive some attention. Instead of showing the full schedules, drying times are given in days for stocks containing 30% and 40% moisture content.

Wood	30% Moisture Content	40% Moisture Content
Birch	10 days	12 days
Maple	11 days	15 days
Gum	12 days	14 days
Walnut	15 days	19 days
Mahogany	10 days	12 days
Oak	20 days	24 days

Designed for Certain Speeds

It would have been a satisfaction to have been able to have included a table of average drying times for various woods containing different quantities of

moisture. Such figures, however, are not available. The figures that have been included are given more to outline what can be accomplished than to seek to establish any uniform set of drying periods. There is one point which should be borne in mind and that is, that it is not practical to increase the drying speed of certain of the older type kilns, without making radical changes in the construction of the kilns themselves. This is given more as a warning, for if a kiln has not been drying oak, for instance, in less than twenty days the stock might suffer were an attempt made to force the drying. Dry kilns, like other forms of woodworking equipment, are built to work at a certain speed under certain conditions. The speed of modern drying equipment is much higher than that of older type kilns. Modern type dry kilns, intelligently operated, will give you minimum drying periods with very low drying losses.

Are You Looking to British Market?

Some Requirements Which are in Strong Demand—Vast Market if Prices are Right—Worthwhile Connections When Once Made

By Acting Trade Commissioner A. B. Muddiman, Bristol, Eng.

More than once this office has endeavored to call the attention of Canadian manufacturers of woodenware to the great demand there is in this country for dowels, handles, and every kind of manufacture of wood if of suitable pattern and quality. It is all a question of competitive selling price. If Canadian manufacturers can deliver at a price that competes, there is a vast market for their goods. In view therefore of the present prices, and also to discover how deep a post-war penetration into this field has been made by German and Scandinavian firms, a survey of local conditions has been made for the Bristol area. Once more this office must say that Canada with her enormous stocks of timber should be selling much more than she does.

Clothes Pegs

Trade inquiries have been received for clothes pegs. There are signs of German activity in this business here. One large importer states "the present German quotations for these pegs is 5s. per 5-gross box delivered. It is thought that this price will be down to 4s. 6d. next week. Quotations have been received from United States houses of 5s. 6d. per 5-gross box, but this price is too high." There is an enormous consumption of clothes pegs in Great Britain, and the only difficulty in placing consignments is gauging the market price at the time of sale. Both ordinary and spring-clip pegs are used. For the ordinary the size is 4½ inches, packed 5 gross in wooden case weighing under 2 cwt. Spring clips are generally packed in cartons of one gross. Quite recently a commission house had inquiries for a dozen carlots of pegs, and would have sold Canadian if the price had not been too high.

Dowels

Canadian manufacturers are covering the market fairly well, but might do more business if they watch German competition, or they may find themselves undersold. For though it is well recognized here that the Canadian dowel is of better quality than the German, their undercutting in price may make serious inroads on sales.

Drawing and Black Boards

There are not enough drawing and black boards at the present time, according to a large educational supplies house, to supply the demand. Germany, via Switzerland, is invading the market, but Canadian-made boards would be of much higher quality than the rubbish Germany is sending out to-day, and our firms need fear no competition with German goods in this regard, if they are prepared to go after the business. There are three types: triple (three-ply), clamped, and panelled. At the present moment for the most ordinary sizes the following are the prevailing wholesale prices. 16 by 11½ inches, 24s.; 19 by 13½ inches, 39s.; 22 inches by 17 inches, 43s. 6d.; 23 inches by 16 inches, 43s. 6 d.; 28 inches by 19 inches, 59s.; 31 inches by 23 inches, 87s.

Library Tables

The retail price to-day for library tables is about £7, and there is no doubt but that, if Canadian manufacturers can compete at this price, they have the goods and also a splendid opening.

Kitchen Cabinets

Kitchen cabinets are selling to-day at abnormally high prices, but even these are less than those of last year, when cabinets were going at £27 apiece. Canadian kitchen cabinets are very highly appreciated. They beat local goods in ingenuity, appearance, and general usefulness. It should be noted, however, that the sifter in the flour bin is not required here and the bin itself is on the large size for an English household. Eliminating the sifter and reducing the bin's size, according to an English woman, and adding a shelf, would make them perfect.

To-day if manufacturers can land Canadian cabinets in Great Britain at a price that it would make it possible for the retailer to buy them at £15, they would find a large sale. The cabinets in question should be k.d. and of small grain oak.

Students' Bookcases

Small open wood bookcases known here as students' bookcases, are in brisk demand to-day. Canadian manufacturers' c.i.f. prices for these to-day should be from 12s. 6d. to 23s. if they intend to land these goods. They should be shipped k.d.

A type of solid oak students' bookcase, 4 feet high and 2 feet wide, has been selling at 35s., an oak shortboy at 23s. 6d., and tallboys at 55s. and 63s.

Folding Tables

Tables suitable for out or indoor use, which will fold away in a small compass, standing 27 inches high, have a good market. Some are adaptable tables and made up into a kneeling desk, work table, tea table for the garden, music stand, etc. To prevent the leaves collapsing, bolts are fitted on the underside. The three usual straight and top sides are 22½ inches by 18 inches, 22½ inches by 22½ inches, and 22½ inches by 30 inches, while round tops with a 2-foot 6 inch diameter and also ovals are sold. They are made of deal, birch, oak, etc. An average c.i.f. price of 10s.

6d. apiece would find them a ready market in Great Britain to-day.

Deck and Seaside Chairs

The present retail price is about 7s. 6d. If sent over here k.d. and crated at a price around 5s. apiece, there is a good demand. Further, any firm desirous of turning out the ordinary deck chairs for the British pleasure steamer that haunts these coasts in summer would do well to communicate with this office with prices. The marketing for these last class of chairs is around January, and firms are too late for this year.

Handles for Coal Miners

The collieries in South Wales offer a fertile field for selling handles for hammers and picks if the price is right. Any one entering this line must be prepared to land these at the colliery before payment. There is no risk in this with the great Welsh collieries, only all goods will be searchingly examined to see that they are up to sample. Special sizes prevail and there are many patterns. At the present moment this office is in a position to procure a complete set of sample patterns and sizes at a small figure for firms interested.

Tubs

Lard and caramel tubs offer another opening on a large scale if the quotation is low. They are sold by the dozen. Washtubs with diameters of from 22 to 26 inches are used. They should be shipped nested.

Washboards

In regard to washboards it is well recognized here that the Canadian washboard is of the best quality. Factories should send their agents a small stock to keep on hand and prices must not be jumped about, as some Canadian manufacturers have been doing when large orders are forwarded. The object of the small stock for the agents is to keep clients supplied until the arrival of the direct order.

Miscellaneous Requirements

There are many other miscellaneous requirements which could be supplied from Canada, such as broom handles, towel rollers, rolling pins, wood mats, wood measures, wooden screw taps, three-ply veneer chair seats, oblong and round, ironing boards, etc. In some lines, however, United States, Swedish and German manufacturers have a hold on the trade, such as in coat and dress hangers. Prior to the war Germany had a flourishing trade in bread boards, while knife boxes came from Austria and Germany, and some were made in England. The most popular water-closet seat is a ring seat with a cover, made of hardwood, in two states, polished and unpolished. Another line in this direction is an extension seat with a cover. This is of hardwood in two states, polished and unpolished. The writer is informed by a commission house here that there is a good demand for such seats. Again fish tail handles for varnish brushes of white wood in ½-inch from 1-inch to 4-inch could be catered for.

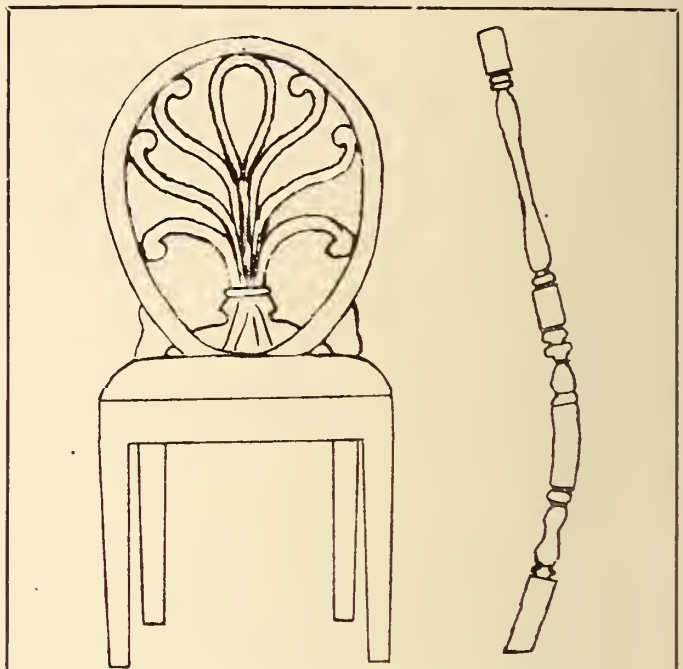
Also in mops and handles for mops, a good business is open if the price is right. It is essential for manufacturers who are desirous of entering the trade, to send their prices.

The bulk of wooden manufactures in this country are imported by commission and merchant houses. Users prefer to purchase supplies from them rather than import direct from overseas. Consequently the trade is largely a question of a comparatively modest rate of profit upon a very large turnover. Mass production therefore for export purposes is essential for Canadian houses to compete with United States and Scandinavian houses.

A consignment method of marketing is one of slow penetration and needs a fair margin of capital. But it must be remembered that once this British market with its huge demands is definitely entered it is one that may be readily maintained.

How Would You Make This Chair Back?

A subscriber of the "Canadian Woodworker" has written asking for details and method of constructing the back of the Hepplewhite chair shown in the accompanying sketch. He also wants information as to the best method for turning the bent, back chair



Send in your method of constructing this chair back and your idea of how the curved back post should be turned

post, shown beside the chair. We are publishing this in the hope that some readers, who are well acquainted with the problems involved, will send in information which will be of service to the party making the inquiry. Your suggestions will be appreciated.

Management in Woodworking Plants

"Installing Management in Woodworking Plants" is the title of an instruction book recently published by the Engineering Magazine Co., New York, Carle M. Bigelow, author. This work treats of the unsatisfactory conditions existing in many woodworking plants and suggests how the work may be systematized and efficiency methods introduced. The subject is covered in a thorough and comprehensive manner, as will be gathered from the following chapter headings: Peculiarities of Woodworking; Making Scientific Management Essential; Organization and Its Installation; Product; Lumber; Purchasing and Storing; Planning Department; Layout and Routing; Shop Practice; Cutting of Lumber; Labor Control; Tool and Fixture Control; Repair Control; Waste Control; Power Plant and lastly Cost Accounting. The book is freely ilustrated with forms, charts, time studies, etc., and contains much that is helpful to factory managers and executives. Copies may be secured from the publisher or from the Woodworker Publishing Co., Limited, 345 Adelaide St. W., Toronto. Price $5.00

Imports of Cooperage Stock

The December Canadian Woodworker and Furniture Manufacturer contained an item referring to the imports of cooperage stock for 1919. The figures published, which gave the imports of staves as 26, 841, 432, were taken from a report issued by the Bureau of Census at Washington. W. A. Fraser, managing director of the Trenton Cooperage Mills, Limited, Trenton, Ont., takes exception to these figures and his contention is sustained by a report issued by the Bureau of Statistics, Ottawa, which gives the imports of staves for the fiscal year ending March 31, 1921 as 6,369,000 oak staves and other staves to the value of $233,444 which at the prices prevailing during that period would mean roughly 9 to 10 million staves or total imports of about 15,000,000 staves.

Mr. Fraser gives an interesting outline of why American cooperage stock is such a factor in the Canadian market. His letter is as follows:

"We notice on page 73 of the December "Canadian Woodworker" an item in connection with the importation of U. S. staves by Canada. There is certainly something wrong with the Department of Commerce Bureau of Census' figures, which give 26,841,432 staves as consumed by Canadian importers.

"While of course, owing to the fact that we have no suitable timber in this country for the manufacture of oak barrel staves, these are all brought in from the United States; but at the same time, taking both the tight and slack staves, nothing like 26,841,432 staves were imported during 1919. We would say that one-third of this figure would be the maximum.

"Having a further bearing on this matter, the four largest cooperage manufacturers in Canada only handled a total of 16,803,359 during 1919, and this total not only includes all staves of their own manufacture, but all U. S. staves brought in by them. As the bulk of the importing is done by the Canadian operators referred to, it will readily be seen that there must be something wrong with the U. S. Department's figures.

"Referring to the last sentence of this item, we would explain that the reason for the influx of American cooperage stock depends on three conditions that work directly against Canadian cooperage manufacturers.

"Firstly: While cooperage timber in Canada is limited, growing only in pockets, necessitating heavy rail hauls to the manufacturing centres, incidently at much higher freight rates than prevail in the South, the U. S. manufacturers have almost unlimited supply of cooperage timber available on water hauls throughout the bottom lands of the Mississippi, in some cases, producing as high as fifty thousand feet to the acre.

"Secondly: Practically all the labor employed in the American mills consists of low-priced, colored workmen, and in no branch of their operations do they have the severe Canadian climate to contend with.

"Thirdly: The rich bottom lands from which the cooperage timber is cut in the South, is worth more money with the timber off, for the production of cotton and sugar cane, than it is at the time the millmen purchase it, with the timber standing.

"Besides these natural conditions, the Southern cooperage manufacturer can operate his plant the year round, while in Canada we are confined to an eight month operation, as a maximum. This of course cuts down overhead with them.

"Another point that has often occurred to us and that we have, on several occasions, had up with the Traffic Department of the Canadian Railways is, that the arbitrary tariff arrangements our Canadian roads make with the U. S. transportation companies, when striking through rates, act directly in favor of the Southern manufacturer. As an example, we have from Georgiania, Ala., to Montreal, a distance of over fifteen hundred miles, a rate of 54½ cents on cooperage stock; while we are paying from Trenton to Montreal, a distance of 238 miles, a rate of 21 cents per one hundred pounds. The difference, as shown by this example, is borne out in all freight rates from points in the Southern States to the Canadian consuming centres."

A glimpse of Vancouver, showing plant of Pacific Box Co., Limited

Good Work From Box Board Printer

Features Which Should Receive Special Attention—Cold Weather Adds to Troubles Experienced—How Satisfactory Results May be Obtained

In its moods and tenses, the printing press is in a class by itself. No other machine in a box plant is so largely sympathetic with weather conditions for the production of good work as the printing press, say a writer in "Packages." It is a fair weather machine, needing plenty of sunshine and warmth.

The ideal location for the press is a room or enclosure, used for printing purposes only. This room should be sufficiently large to accommodate the press and its accompanying equipment, two floor trucks, and a bench for bundling. Enough windows to give plenty of good light are essential, a large door for the passage of trucks, and a smaller one for general use. The great difficulty in printing in cold weather is that the ink becomes so cold it refuses to ruu from the fountains and to spread. To conquer this difficulty is the chief reason for separately housing the press. The room should be provided with radiators and the air kept at a moderate temperature throughout the cold weather. The room should also contain cabinets or closets for the storage of inks, rollers and dies. Keep all cans, kegs and barrels containing inks tightly covered at all times.

Special Provision for Rollers

The closet for the rollers contains a rack so that the rollers can be put away in a horizontal position, and the rack is made so that each roller will at no point come into contact with its neighbors. One roller lying on another for any length of time will cause both rollers to become flat at the point of contact, and these flat places destroy the even distribution of the ink.

A pan of clean water should always be kept in the bottom of the roller closet to prevent the air from becoming too dry.

Rollers are made from a composition of glue and molasses, and not from rubber, as many believe, hence their very nature requires great care in handling, if their effectiveness is to be preserved. Rollers used in colored inks should be washed immediately at the end of the run, or if the run is a long one, they should be washed each night. Colored inks dry very rapidly, and stick to the roller like glue. Some good pressmen, not desiring to wash their rollers at once, cover them with a coat of machine oil. This coating shuts out the air from the ink, and rollers so treated may stand for several days without the ink becoming hard.

For washing rollers, use coal-oil. Never scrape rollers with a metal instrument, and do not use gasoline for washing, as the rapid evaporation of the gasoline, takes along with it some of the native moisture of the roller, and leaves it dead.

It is a good idea, if you are putting away clean rollers for any length of time, to roll them over a clean dusty space on the floor, removing the dust coat before putting them on the press again, with a clean cloth dampened in water. After washing rollers with coal-oil, all traces of oil should be removed with a water dampened cloth.

Never use lye-water for cleaning rollers. This destroys a roller in a very short time. An old set of rollers which have become hard and greasy, may sometimes be given a new lease on life, by giving them a bath in lye, wiping them with a dampened cloth. Rollers used in black ink, suffer no damage by leaving the ink on them, unless the ink is a very quick drying one, and it is just as well to put them away without washing.

Special Precaution Necessary

If you are leaving the rollers on an idle press, do not leave them in position, but raise them up so that they do not touch each other, and place the covers on the fountains. Ink always gives better service when free from dirt.

In cleaning the fountains all ink should be removed as thoroughly as possible, the good clean ink being returned to its respective container, and the dregs thrown out. The dregs will be found at the lip of the fountain against the fountain roller. After all ink has been removed as cleanly as possible with the knife, wash the fountain with lye-water or coal-oil.

Clean cotton rags are without a peer for all washing purposes.

Some ink knives of convenient sizes should be provided for tranferring ink from the containers to the fountains, and for removing the ink from the fountains.

Dies Require Special Attention

Nothing so greatly detracts from the neat appearance of printed work, as the imprints of inky, smutty fingers. Facilities for washing hands installed in the press room will leave the workmen with no excuse for soiled work, and will prove an investment worth while.

A closet for the storing of dies is an incentive for an orderly arrangement of dies for these, and has the further advantage of providing a place where they will be subject to less damage than if left lying around the press room. A slight blow with a hard object easily spoils the face of a die. Dies can readily be cleaned with lye-water and a stiff brush, not so stiff however, as to scratch the face of the die. Wash dies when through with them and put away.

Keep your press well wiped, and the bearings well oiled.

Fast Feed Planer and Matcher Book

An illustrated 92-page book on Fast Feed Planers and Matchers has just been issued by the S. A. Woods Machine Co., Boston, Mass.

It only requires a little ingenuity to arrange that a current of air should blow upon the wood just before the fret saw. It makes the sawing so much easier.

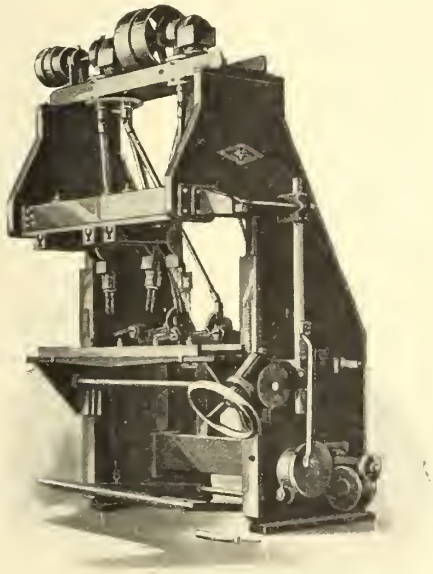
To put a band saw into three coils you hold it in each hand and then twist the top part twice, after that drop over the twisted part.

Saws that are tempered a trifle on the hard side require more care in the setting of the teeth, yet they hold their cutting edge considerably longer than saws which are on the soft side.

Machinery & Equipment

Double Direction Boring Machine

A new double direction boring machine has recently been developed by the Valley City Machine Works of Grand Rapids. This is shown in the accompanying illustration. The machine is equipped with vertical and horizontal spindles and is capable of semi-universal adjustment for angularity. The spindles are also capable of universal adjustment of center placement. Following are some of the specifications applying: Length of machine 73 inches; width



Double Direction Boring Machine

53 inches; height 100 inches; base 29 x 52 inches; working height 40 inches; machine takes in 44 inches between columns and spindles are adjustable to cover an area of 6 inches x 36 inches; weight 4600 lbs. Closest center distance between spindles is 4 inches. Each spindle swings 10 and 15 degrees from 90 plus or minus, and the end bearings are fitted to receive clusters for close center multiple boring as required by individual clients. The machine is normally fitted for eight spindles—four vertical and four horizontal—but any number of spindles required can be furnished. The equipment has two speeds and three variable feeds. The travel of bits is adjustable to 3½ inches. All spindle units are interchangeable and integral with independent adjustment for angularity and position. Feeds of vertical and horizontal spindles are independently driven with a quick return motion of 2 to 1 ratio. These feeds are controlled by a treadle actuated clutch. The machine is especially adapted to chair work and for post boring. Its many new features commend it to discriminating manufacturers, especially those seeking increased production. The machine can be furnished with motor or belt drive.

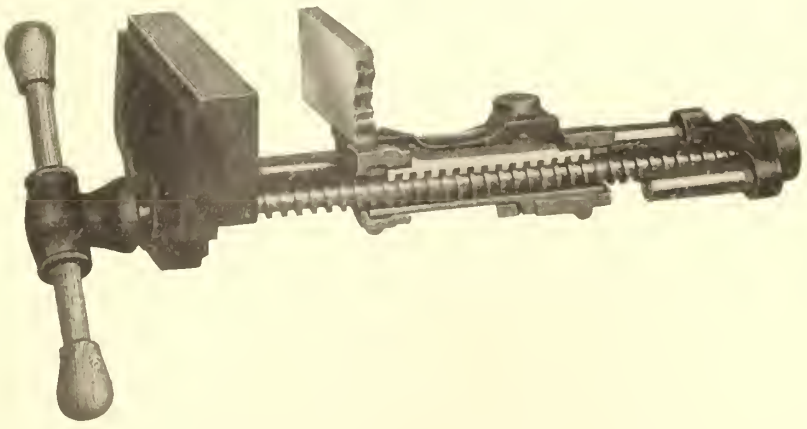
Quick Action Vise

Modern equipment is essential to progressive manufacturing. One of the items that has undergone considerable development and improvement during recent years is the humble bench vise. The old type, with either wood or steel screw, which had to be tediously turned in or out, has been replaced by the modern style of quick-acting vise. With this latter design, a half-turn of the screw either releases or locks the nut on the screw. In this way the jaws of the vise can be opened or closed with extreme rapidity. The accompanying illustration shows, in detail, a type of quick-acting vise which has been placed on the market by the Globe Vise & Truck Co. of Grand Rapids, Mich. It will be noticed that there are no delicate castings to give trouble, every part being built to stand a considerable amount of wear. The screw is made of 1 1/8 in. carbon steel with threads cut away longitudinally, permitting a free movement of the screw backward and forward, giving a quick reliable action with a sure grip when pressure is required.

The Russian forest authorities consider that the forest of Russian Far East is somewhat over 750,000,000 acres in extent.

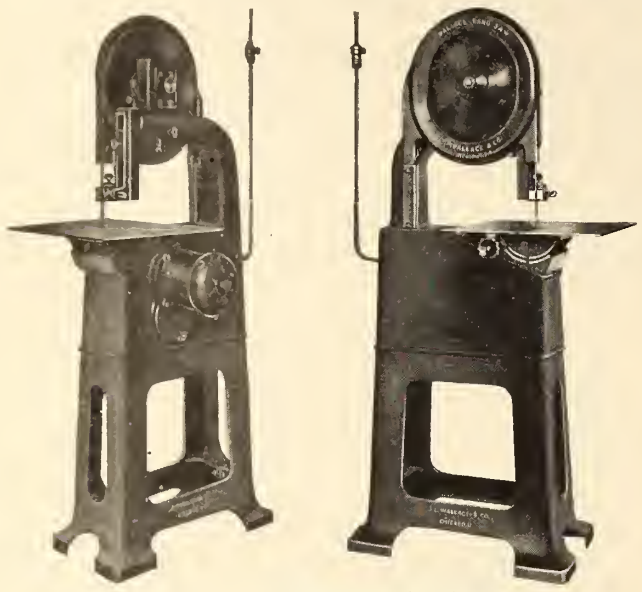
The life of a small mortise chain depends largely upon the care taken in sharpening and working it.

Sectional view of "Globe" quick acting vise



Small, Portable Band Saw

A new addition to the Wallace line of portable woodworking equipment is shown in the accompanying illustration. This is a 16 inch band saw. Among the new features found in this tool are steel disc wheels, ball bearings, even the upper and lower guides being of a ball bearing type. The motor is connected to the lower wheel by fibre gear and steel pinion, both running in oil to ensure perfect lubrication and quietness of operation. The table is 19 by 21 inches



Two views of Wallace portable electric driven band saw

and is mounted on a rocker bearing which permits of adjustment to any angle from 45 degrees to minus 5 degrees. The height of this machine is 5 feet, 9 inches over all, the table being 42 inches from the floor. The floor space required is 15 by 29 inches. The motor, which is ball bearing, is ½ h.p. and runs at 1750 r.p.m., driving the saw at the rate of 3150 feet per minute. The machine is driven from any light circuit and may thus be set up in any part of the plant or moved from section to section as required. Further particulars may be had from J. D. Wallace & Co., Chicago, Ill.

"The Desire to Win"

They had just finished the last rubber of bridge—a young man and the president of a large corporation. The stakes were small and the young man paid the toll. To show his indifference to the loss, the young man said: "I don't care whether I win or lose; I enjoy the game."

The president looked at him and said: "If I didn't want to win I wouldn't care to play. If I lost the desire to win I should not care to live. The desire to win is the one thing that makes life worth living. It is back of every great achievement. No man can be happy—no man can be successful—who does not desire to win.

"A determination to win—not once in a while but all the time—is responsible for the success of every big man. A man cannot always win, but he can always try to win, and the more he tries to win the oftener he will win.

"It was the determination to win which eventually won the war.

"It is the desire of the doctor to win that enables him to pull the patient through. The doctor is not fighting for his fee—he is fighting to win.

"I have employed a good many men in the last forty years" said the president, "and I never employed one until I was satisfied that he had above all other qualifications a firm determination to win.

"But you can't win at bridge if you don't have the cards!", said the young man.

"Some men do", replied the president. "If you doubt it, try duplicate bridge. One man plays the hand and loses one trick; the hands are reversed and his opponent gains one. You will say the opponent was a better player. So he was. But he was a better player because he possessed the desire to win. The desire to win made him study the game—know it—and play it well.

"Whether you are playing or working, it is the determination to win that decides the issue."

New Beltless Swing Saw

The Oliver Machinery Co., of Grand Rapids, Mich., have applied the beltless principle to one of their swing cut-off saws. The advantages of this idea are obvious; the elimination of belts, pulleys and countershafts, and the fact that friction is reduced to a minimum through the elimination of numerous bearings and the use of ball bearings. This machine is

Beltless swing saw developed by Oliver Machinery Co. Grand Rapids

furnished only for 2 or 3 phase, 60 cycles, 220 or 440 volt, alternating current, and to 3 h.p., and runs at 3600 r.p.m., developing 3 h.p. A 16-inch saw is carried on the end of the motor arbor. The control, as shown, is part of the motor head block and is thus always within easy reach of the operator. The control is of the push-button type. This saw, together with the Oliver new style swing saw table, which is of the roller type construction and fitted with special automatic stops, makes a very complete and efficient combination.

When your sanding belt is burning the end grain of the wood you can be sure that the belt is running too fast for that particular job.

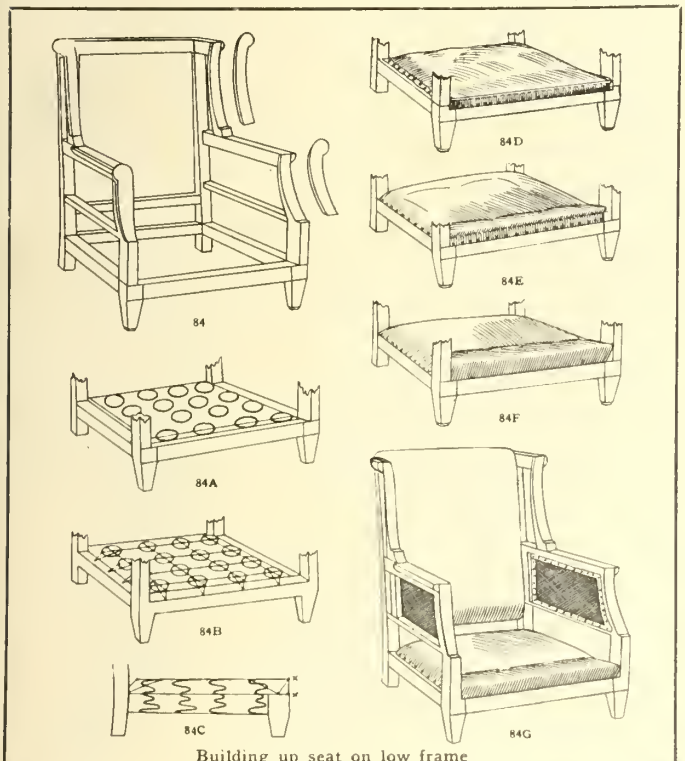
Upholstering and Trimming

Planning Deep Seat For Low Chair

Comfort First Consideration—Spring Edge Recommended Where Frame is Low

In the upholstering of any type of chair frame there has to be kept always prominently in mind the requirements of bodily comfort and any shape which does not conform to the dimensions of the human body, is a failure from the standpoint of serving its chief purpose as an article of furniture, says John W. Stephenson in the "Upholsterer." In the consideration of the frame represented in Fig. 84, the chair frame, which has purposely a very low seat, requires a different form of treatment from that which has been indicated for the chairs already covered in this series.

The frame of Fig. 84 has very short legs, enabling the upholster to provide a deeply-cushioned seat, in



Building up seat on low frame

order to bring the finished height of the seat the necessary distance from the floor, which, as ws have said elsewhere, is about eighteen inches.

Using Spring Edge

For this reason, we suggest in the unholstering of Fig. 84, the employment of the spring edged seat, and we have indicated in the first of the sketches, in connection with Fig. 84, the details of forming a spring edge.

We have not attempted here to teach the rudiments of spring-edge work, because it is to be assumed that the upholsterer who is interested in the advanced methods of upholstering which we are describing in connection with these high-class types, has already mastered the rudiments of the foundation work.

Fig. 84a, shows the placing of the spring; four rows of four springs each, the front row being preferably springs specially constructed for spring-edge work, having either a square front or finished with a large top coil, which makes it less difficult to bring the front edge of the top coil in line with the front edge of the chair rail, as indicated in Fig. 84b, and by XX in 84c, a cross-section of the chair which shows the placing of the springs.

Fig. 84d shows the seat sprung up and canvassed, the wire or cane, enclosed by stitching, being about 1½ to 2 inches above the rail.

The next step in connection with the upholstering of this seat is the forming of the stitched edge, which is provided by doubling stuffing the seat, as indicated in Fig. 84e, which shows the edge ready for stitching. In the stitching of the edge, care should be taken to keep it soft and somewhat blunt, because it is necessary to have every part of the upholstering of the chair we are describing as soft as can be, and still retain sufficient firmness to hold its shape.

Following the stitching of the edge, the next process is the final layers of hair and the covering in muslin, bringing the process to the point indicated in Fig. 84f. It will be noticed that this chair is provided with loose strips which form the final finish of the arms and wings. These are removal for all the preliminary processes of upholstering, and are only used to promote uniformity in the completed appearance of the chair.

The back of this chair is upholstered with springs in the manner detailed in Fig. 14, and then has the appearance indicated in Fig 84g.

Duo Tones in Upholstered Furniture

The delightful duo tones which have been used with such good effect on the better grades of case goods, have found their way into the upholstering departments. Many manufacturers are turning out pieces covered usually in two distinct shades. If well done, the result is rather attractive, and makes a pleasing departure from the regular styles of upholstered furniture.

Like other fads, which have had their day, this tendency will, probably, be carried to extremes and be overdone by some upholsterers. Good taste and an eye for color are required to work out attractive color combinations. This is more true to-day than ever before, for the day when anything will sell, whether or not it violates the canons of good taste, is past. The public are showing greater discrimination than ever in making their purchases with the result that unless one observes the dictates of good taste and shows good judgment in selecting combination coverings, it is not likely that the product will find a ready sale.

Temperance in all things is not a bad motto. The public will only go so far in their fondness for that which is bizarre or faddy. The staple lines are the ones which the prosperity of any business depends and are the ones which should be fostered and developed through good and bad times.

Trend of Design in Upholstered Furniture

One phase of development in the manufacture of upholstered furniture is the use of fancy carved feet in various period designs and the development of designs which permit a certain part of the wood frame to show. In the latter event, the bottom rail, which

Carved fibre foot for upholstered furniture. May be had in a variety of designs

is the part usually exposed, is worked out and ornamented to conform to the style and outline of the feet and the whole finished in keeping with the general effect and tone of the finished article.

In the newer designs the use of carved ball and square feet in the Louis XIV, XV and XVI styles, together with the pleasing curved Queen Anne proportionately carved, make a marked advance in bringing upholstery into the realm of the periods and in no way lessening the comfort that is always inviting.

Like all things beautiful, especially where the hand tool is required, the cost of trimming is almost prohibitive, and it is safe to say that the period furniture would never have reached the popularity it has, were it not that a reliable substitute for the hand tooled wood carving can be had.

The substitute offered by a Canadian manufacturer has proven satisfactory in appearance, strength and durability. The construction is of wood and highly compressed fibre, and is treated in every respect as if it were a wood. When properly screwed, glued, dowelled and finished, it is an integral part of the frame. From the supreme viewpoint—service—it cannot be excelled by its genuine counterpart, wood.

Chesterfield feet will undoubtedly be subjected to a more severe treatment than any other piece of household furniture, principally because of their location and also because of the weight and bulk of the piece in question. But in spite of the unintentional and unguarded knocks, the fibre substitute has proven its worth, largely because the mass has no core grain. The grain seen is but surface effect. The likelihood of cracking or chipping is beyond question. Its adaptability is all that can be expected of wood itself. It will lend itself to the tool, can be glued and screwed, and is adaptable to the standard castor and gliding shoe.

The economic factor is most interesting when compared with the hand carved counterpart, amounting to but one tenth of the actual cost of its reproduction in wood.

Importance of Correct Glue Temperanure

In an address before the furniture manufacturers, foremen and superintendents at the recent annual meeting of the Furniture Manufacturers' Association, Mr. Feldkamp, of the Canada Glue Co., emphasized the importance of maintaining glue at the proper temperature and laid stress on the fact that this adhesive loses it strength rapidly as the temperature is increased. The best temperature is in the neighborhood of 125 to 140 degress Fahr., although the glue may be heated as high as 150 degrees without showing any signs of deterioration. Above this heat the strength rapidly leaves the glue and it is claimed that animal glue is practically useless as an adhesive by the time it is heated to 185 degress,—just 27 degrees below the boiling point.

Naturally all glue users are desirous of having their glue at its greatest strength although many do not give the question of temperature the consideration it deserves. There is another side to it, however, and that is using overheated glue is one cause for such troubles as open joints, loose veneers and other faults due to weakened joints. To secure the best results and to produce a product which will give a fair degree of satisfaction, it is necessary that greater attention be given to the temperature at which animal glue is held.

Why wait to get a length of belting to repair a break? Keep a good stock, it is always handy.

COLORED ENAMELS

MARIETTA WOOD AND METAL FINISH SPECIALISTS

The growing popularity of colored enamels for breakfast room and bedroom furniture has made this feature of our business a strong one with manufacturers specializing in

Enameled Furniture

We make them in all colors—the popular ones being Ivory, Blue, Yellow, Mauve, Mahogany, Pink, French Gray, Jade Green and Delft Blue.

Beautiful effects are obtained by enameling with one color and decorating with another.

Can be sprayed or brushed.

We are supplying some of the largest manufacturers. Write for full information.

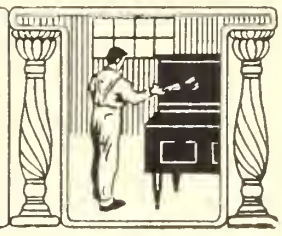
THE FINISHING ROOM



Lacquer Finishing on Furniture

Lacquer has Many Commendable Features—Not Easily Marred and Does not Check Nor Craze

By G. W. Phillips*

Now, on the threshold of what bids fair to be a most wonderful era in the furniture business, we are compelled to pause and look for new finishes and finishing materials to keep pace with the wonderful strides made in style and artistic design.

For many years, the metal finisher has employed pyroxylin lacquers to protect and beautify his work. It has long been realized that these pyroxylin lacquers gave finishes far more durable than those produced by any other materials. With the passing of highly polished, mirror-like surfaces, built up from many coats of varnish, and the advent of the new art finishes, it becomes possible to apply these wonderfully durable lacquers to furniture finishing.

Have Certain Desirable Features

The lacquer finishes possess certain very desirable characteristics in addition to their simple beauty. The highly polished surfaces of yesterday were easily marred and at all times almost impossible to keep presentable. The lacquer finishes of to-day are hard, but elastic, they will not scratch, nor show white marks, niether will they paper mark, check or craze. They are water-proof and are unaffected by heat or cold.

The application of lacquer to furniture finishing presents no great difficulties to the finisher. The lacquer may be applied either by brushing or spraying, spraying, of course, being preferable. Some of the wood lacquer on the market must be reduced with a special thinner to the correct consistency for spraying, while others are supplied by their manufacturers at a body which works satisfactorily either for spraying or brushing. In applying the lacquers with a spraying apparatus, it should be remembered that the best results are obtained with not more than thirty pounds pressure; the nozzle of the spray gun being kept at a distance of about seven or eight inches from the work.

The best brands of art lacquers are liquids of great clearness and almost water white in color, so that they do not change the most delicate shades of stain. The dried lacquer film sands easily to a velvety surface which is very popular. It is possible to shade over the lacquer with excellent results. Lacquers are also employed very successfully as a wash for water stains before sanding, or for making a good water-proof ground for filler.

Art Finish on Walnut

Lacquer has found very extensive use in the production of art finishes on walnut. This type of finish which is very popular in some of the factories is not difficult to use. Apply water stain of desired shade. When the water stain is thoroughly dried, apply one coat of lacquer, let dry from one to two hours, and then sand lightly. Fill, if necessary. After sanding apply two coats of art lacquer and finish with a flat varnish or wax.

Desirable Finish for Fumed Oak

Lacquer gives splendid results on fumed oak. Use an acid stain or a fuming box, or both if necessary, then apply one or two more coats of lacquer, "shade in" and finish with either wax or flat varnish. This procedure gives a very soft, velvety finish, artistic in appearance and durable beyond mention.

The methods which have been described above are only two of many which are in use. New methods of using lacquers are being developed all the time in the various factories. The lacquer is being used not only on oak and walnut but on practically all of the other woods which are used in the manufacture of furniture. Lacquer finishes appeal to both manufacturers and buyers. Their popularity is sure to increase, and in view of the fact that their application is only in its infancy it is safe to predict great developments along these lines.

Fake Finishing Formulas

The "Canadian Woodworker and Furniture Manufacturer" for September, 1921, contained some information pertaining to a man who was calling on different woodworking plants endeavoring to palm off worthless formulas for celluloid enamels. As stated in this warning, this chap is very plausible and tells a good story but several readers of the "Canadian Woodworker" have found from experience that the information given is entirely useless. It has come to our notice that this man is in Ontario again and is working the old game.

Acetone will dissolve celluloid, making a liquid which may be applied by either spray or liquid. So far, so good. When this coat dries it is found to be soft and chalky and is totally unfit for a finish.

Spraying Enamel Interiors

Furniture manufacturers are gradually veering around to the idea of using spray equipment for the application of all finishing materials. This has been found to be more efficient than, and to offer advantages over, the older method of applying finishing materials by hand. Sometimes, however, certain problems are encountered such as when the inside of a case is finished in a different color from the outside, such as occurs in the case of kitchen cabinets and refrigerators.

When overlapping of different materials like this is encountered, the outside finish is usually applied first. When it comes to finishing the inside, some op-

erators use a shield made from cardboard or thin metal to keep the spray away from the outside surfaces. Another method, one that has proved very satisfactory, is to place the work on a turn-table, to facilitate handling, and as the inside is being sprayed near the stained edge, the stained part is turned away from the operator, and the enamel or paint is sprayed at an angle toward the outside of the cabinet and toward the fans, so that all surplus material is carried past the stained face and is exhausted.

This process may be reversed and the stain applied after the interior has been finished. The same procedure is followed. The work is turned around and the stain applied at an angle that permits the exhaust to carry the surplus away in such a manner that none of it will enter the interior of the cabinet.

Good Varnish—How to Test It

Outline of Tests and Specifications for Varnish for Interior Work—How Various Tests are Made—What Constitutes Good Varnish

The Bureau of Standards, Washington, D. C., recently issued a circular covering specifications and tests for varnish. While these apply primarily to varnish for interior work, the methods of testing outlined and the qualities required are such as to prove of interest and value to all varnish users. It was prepared and recommended by the U. S. Interdepartmental Committee on Paint Specification Standardization and is as follows:

General Qualities

The varnish shall be suitable for general interior use, including both rubbed and unrubbed finish, exclusive of floors. It must be capable of easy application with a brush in the ordinary manner according to the rules of good standard practice, must flow out to a good level coat free from runs, sags, pits or other defects, and dry with reasonable promptness to a hard, somewhat elastic glossy coating which can be rubbed in 48 hours or less. The manufacturer is given wide latitude in the selection of raw materials and processes of manufacture, so that he may produce a varnish of the highest quality. The varnish must meet the following requirements.

Appearance,—Clear and transparent.

Color,—Not darker than a solution of 3 g of potassium dichromate in 100 cc of pure sulphuric acid, specific gravity 1.84.

Flash Point (closed-cup),—Not below 30 degrees C (85 degrees F.)

Non-volatile Matter,—Not less than 45 per cent by weight.

Set to Touch,—In not more than 48 hours.

Dry Hard,—In not more than 24 hours.

Dry to Rub,—In not more than 48 hours.

Toughness,—Film on metal must stand rapid bending over a rod 3 mm (⅛ inch) in diameter.

Working Properties,—Must have good brushing, flowing, covering, levelling, and rubbing properties, and must show no impairment of lustre or other defect when used where natural or illuminating gases are burned or when subjected to air currents during the process of drying or application.

Water Resistance,—The dried film must stand application of cold water for not less than 18 hours without whitening or showing other visible defect.

2. Taking Samples for Tests

It is mutually agreed by buyer and seller that a single package out of each lot of not more than 1000 packages be taken as representative of the whole. Whenever possible, an original unopened container shall be sent to the laboratory, and when for any reason this is not done, the inspector shall thoroughly mix the contents of the container sampled, transfer not less than 1 quart to a clean dry glass bottle or tin can which must be nearly filled with the sample, securely stoppered with a new clean cork or well-fitting cover, or cap, sealed, and distinctly labeled by the inspector.

The inspector should take a duplicate from the container sampled to be held for check in case of dispute, and, when requested, should take a sample for the seller.

The tin panels used in the following tests shall be cut from bright tin plate weighing not more than 25 g nor less than 19 g/dm^2 (0.51 to 0.39 lb./ft.^{2}). (Commercial No. 31 gage bright tin plate should weigh about 0.44 lb./ft.^{2} It is important that the tin plate used shall be within the limits set.)

3. Laboratory Examination

(a) Appearance,—Pour some of the thoroughly mixed sample into a clear glass bottle or test tube and examine by transmitted light. The varnish must be clear and transparent.

(b) Color,—Prepare a standard color solution by dissolving 3 g of pure powdered potassium dichromate in 100 cc of pure concentrated sulphuric acid of specific gravity 1.84. Gentle heat may be used if necessary to perfect the solution of the dichromate. The standard color solution and a sample of the varnish to be tested shall be placed in clear, thin-walled glass tubes of the same diameter. The color comparison shall be made by placing the tubes close together and looking through them by transmitted light. The tubes used for this test should be 1.5 to 2.0 cm (5/8 to 13/16 inch) in diameter and shall be filled to a depth of at least 2.5 cm (1 inch). (Since the potassium dichromate-sulphuric acid must be freshly made for this color comparison, it is frequently more convenient to compare samples with a permanently sealed tube of varnish which has previously been found to be slightly lighter in color than the standard solution of 3 g dichromate in sulphuric acid. When samples are found to be darker than this standard tube of varnish, the dichromate standard should be made up for final decision.)

Making Flash Point Test

(c) Flash Point.—Determine with either Tag or Elliott closed-cup tester. The former is preferred, and directions for its use are found in A.S.T.M. Standards D 56-19. For method of determining with the Elliott cup see proceedings A.S.T.M., 1917, part 1, page 414.

(d) Nonvolatile Matter.—Place a portion of the sample in stoppered bottle or weighing pipette. Weigh container and sample. Transfer about 1.5 g of the sample to a weighted flat-bottomed metal dish about 8 cm diameter (a friction-top can plug.) Weigh con-

tainer again and by difference calculate the exact weight of the portion of sample transferred to the weighted dish. Heat dish and contents in an oven maintained at 105 to 110 degrees C. (221 to 230 degrees F) for three hours. Cool and weigh. From the the sample taken, calculate the percentage of non-volatile residue.

(e) Drying Time.—Pour the varnish on a clean glass or bright tin plate not less than 15 cm (6 inches) long and 10 cm (4inches) wide. Place the plate in a nearly vertical position in a well-ventilated room but not in the direct rays of the sun. The temperature of the room should be from 21 to 32 degrees C (70 to 90 degrees Fahr.) The film is tested at points not less than 2.5 cm (- inch) from the edges of the film, touching lightly with the finger. The varnish is considered to have set to touch when gentle pressure of the finger shows a tacky condition but none of the varnish adheres to the finger. The varnish is considered to have dried hard when the pressure that can be exerted between the thumb and forefinger does not move the film or leave a mark which remains noticeable after the spot is lightly polished. If rapid light rubbing breaks the surface, the sample is considered not to have satisfactorily dried hard. In case the test shows time of setting to touch or drying hard more than 4 and 24 hours, respectively, two additional tests shall be run on different days and if the varnish does not meet the above drying and hardening requirements on both of these additional tests, it shall be considered unsatisfactory.

(Continued in March issue)

Lubrication of Woodworking Equipment

High Spindle Speeds Require Special Attention to Lubrication

The tendency of modern machine tool practice is towards higher speeds with heavier cuts, increased output being the driving factor. This dictum holds equally good for woodworking machinery as with all else. It may be that it applies with perhaps even greater force since in this industry high speeds have long been the rule with some classes of machinery.

This increase of rotational speed, and the heavier strains imposed as a result of higher tool capacities, must of necessity soon reach a limit unless accompanied by a corresponding increase in the texture quality of the material employed, and more adequate means for lubricating the rubbing surfaces.

The day has long gone by when an occasional drop or two of oil into an open oil hole, and so to a bearing, must serve until a protesting shriek announces the fact that it is time for another dose. So also is the day gone of the oil box and oiled wad of tow or cotton-wool. Gone also is the cylindrical lubricator carrying a central small tube down which is thrust a wire carrying a tail of plaited worsted, which is supposed to function as a siphon.

These devices were, doubtless, very efficient in their day; so also was the post chaise, Stephenson's "Puffing Billy," Arkwright's spinning loom, Newcomen's pumping engine. But that day is not to-day; something infinitely more reliable and effective being demanded.

Woodworking machinery is, above all else, the most difficult to deal with in this respect. The dust arising out of the various conversion processes is much more apt to become a choking, clogging agency than, say, the cuttings from metal-working tools. It is not only absorbent, but it has a tendency to glutinise or gum up the oil. For this reason more than ordinary precautions need to be adopted in designing lubricating points of woodworking machinery. It is, therefore, advisable that these should never be exposed; never situated where they are liable to be covered over and forgotten by dust, chippings, or other refuse; never wholly dependent upon the vagaries of human nature for their regular attention.

What Scientific Lubrication Means

We are told that a properly lubricated journal running in a bearing does not actually touch in a metal-to-metal sense, that it runs on a thin oil film which, if the pressure be not excessive, never becomes broken. How far this is true in actual practice I cannot really say, but this much, at least, is certain: that a mechanically perfect bearing need not, necessarily, become the least bit worn, providing it is all the time being efficiently lubricated.

Given every protection against outside influences that have a deterrent effect upon the means for efficient lubrication, given human endeavors to avert as far as possible unnecessary obstacles to smooth running, it is all of little avail unless a scientific discrimination is exercised in the selection of oils for lubricating purposes.

The higher the speed of a machine the thinner and lighter is the oil required. If an oil of heavy body is employed on, say, moulding or cutter spindles which may run at from 5,000 to 8,000 revolutions per minute, the cohesive force holding the particles of oil together cannot be overcome with sufficient rapidity, hence undue friction is set up, and heating occurs. Therefore oils of light body and low viscosity are to be preferred.

On the other hand, with slower-moving machinery and heavier bearing pressures, as exemplified in log band mills, frame and rack saws, and so on, a heavier oil of high viscosity is desirable.

Then, again, temperature must to a great extent govern the selection of an oil. Oils that are suitable to heated rooms, factories, or woodworking shops would be altogether unsuitable for machinery that is more or less exposed to all weathers.

The aim always is to use the thinnest oil that will reduce friction. It may also be accepted as a general rule that the use of too heavy an oil invariably means waste of power.

Pointing the Moral

Now if there is a lesson to be learnt, it is that in order to obtain the most economical results and the highest efficiency from your machinery, it is advisable to seek expert advice in the selection of lubricating oils. As a practical timber converter or woodworker you naturally would not expect an oil refiner to help you out of a technical difficulty. You would not tolerate his advice or methods or operations. You would consign him to a destination where heat waves are common if he ventured to poach on your own particular preserves.

Then why take it for granted that you know all that is worth knowing about a lubricating oil? Neither you nor I know what in this respect is best for our peculiar needs. Then give the man that does know a chance!—"Timber."

Wood Products Wanted

The increase in the number of inquiries for wood products being received by the Department of Trade and Commerce, Ottawa, seems to indicate that the British market for articles of wood is improving. A few of those received recently which may be of interest to readers of the "Canadian Woodworker" are published herewith. The names of the parties making these inquiries may be secured from the Commercial Intelligence Branch of the Department of Trade and Commerce, Ottawa or from the publishers of this paper. Give number of inquiry when asking for information.

3766. Dowels and cornice poles.

3767. Hickory golf sticks.—Unturned, 7/8 in. by 44-inch straight grain second growth white hickory golf sticks.

3768. Last blocks.—Kiln dried, if possible.

3829. Roller blocks.—Sawn maple roller blocks delivered, Plymouth.

3830. Clothes pegs.—Clothes pegs with wire spring.

3831. Dowels.—Lengths 30 and 36 inches and of diameters 1/4-inch, 5/16-inch, 3/8-inch, and 1/2-inch.

3860. Box shooks.—A Liverpool firm desire to get into touch with a first-class shipper of box shooks.

3862. Hickory and ash handles.

3863. Birch, beech and maple dowels.

3915. Dowels.—Maple and birch dowels.

3916. Clothes pegs. 4 1/2-inch clothes pegs, packed 5 gross in a box. Are prepared to purchase 1,500 boxes.

Why Waste Money in Your Drying Room?

Air-drying of coatings of any kind is out of the question. No manufacturer could afford it even if the best drying conditions always prevailed—which they do not.

But with Nichols Varnish Drying Equipment you always have very much better than the best natural conditions, reducing days of drying to hours, and the drying is better done: "From the inside out."

This is accomplished by producing always and automatically the correct combination of temperature and moisture, and of air that is absolutely clean.

Why is a Spray Head?

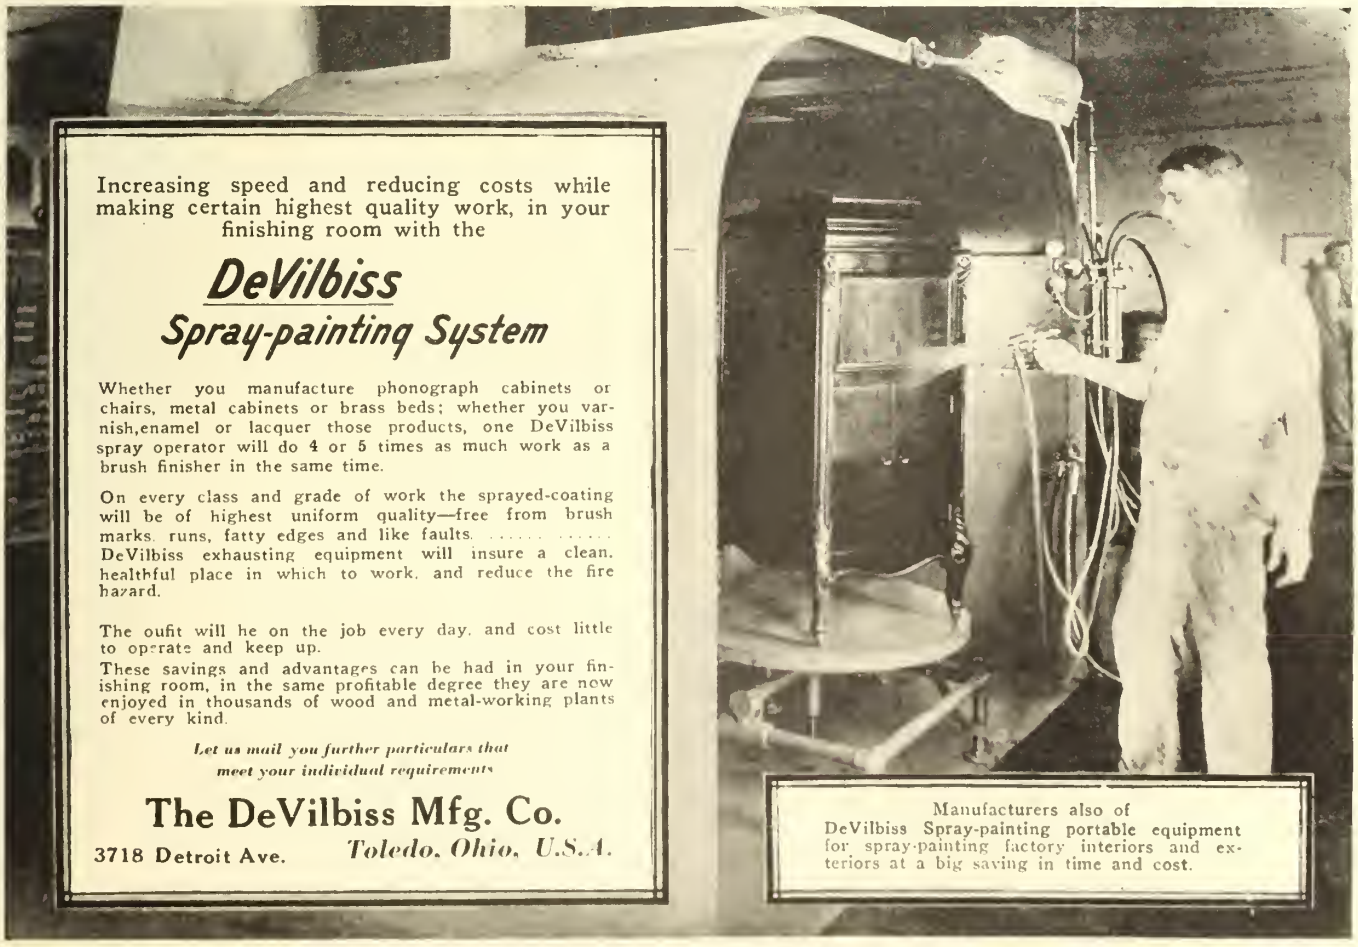
Furthermore, the spray for washing the air in Nichols Drying Equipment is produced in a simple and ingenious manner without the use of the spray nozzles, connecting pipes, pump, and strainers, all of which require so much attention and give so much trouble.

We urge manufacturers to ask us for description of apparatus and for records of its accomplishments, saving single manufacturers many thousands of dollars in reducing the time the product is held up in drying, and increasing the quality besides.

A. S. NICHOLS COMPANY Aeolian Hall New York City

Manufacturers alo of

Nichols Lumber Dryers, Veneer Dryers and Hydraulic Pumps



Increasing speed and reducing costs while making certain highest quality work, in your finishing room with the

DeVilbiss
Spray-painting System

Whether you manufacture phonograph cabinets or chairs, metal cabinets or brass beds; whether you varnish, enamel or lacquer those products, one DeVilbiss spray operator will do 4 or 5 times as much work as a brush finisher in the same time.

On every class and grade of work the sprayed-coating will be of highest uniform quality—free from brush marks, runs, fatty edges and like faults. . . . . DeVilbiss exhausting equipment will insure a clean, healthful place in which to work, and reduce the fire hazard.

The outfit will he on the job every day, and cost little to operate and keep up.

These savings and advantages can be had in your finishing room, in the same profitable degree they are now enjoyed in thousands of wood and metal-working plants of every kind.

Let us mail you further particulars that meet your individual requirements

Veneers and Panels

Counteracting Moisture in Veneer Work

Many Troubles Due to Moisture in Material --Points to Watch—How Moisture can Best be Eliminated

By John Welmers

The veneer room is frequently the source of many of the troubles experienced all the way through the factory and even up to and in the customers' homes. The methods and equipment used may be of the best, but even at that, if brain work is not the leading factor in the veneer departments we may expect to trace certain troubles back to the veneering operation. Taking for granted that the glue used is good, that the methods of laying and pressing are O.K., there is still another factor which follows and if this factor is not taken into consideration there still exists one of the greatest stumbling blocks toward the production of the best work.

It is a known law that wood stays uniform as long as it is kept in uniform surroundings and that if the conditions vary the wood will vary likewise. If the air becomes more moist or humid, wood will take on a relative amount of moisture and swell correspondingly, or if on the other hand the air becomes drier, wood will lose moisture and shrink correspondingly.

Movement of Wood Causes Trouble

In the November issue of the "Canadian Woodworker and Furniture Manufacturer" for 1919, there appeared an article by the author stating why it is necessary to dry glued up core stock before planing it so as to eliminate sunken joints. This same fact that the edges of the core stock joints swell slightly when they absorb moisture from the glue holds true with any glue joint, veneers not excepted. Probably it is not generally realized that such a little thin piece of wood as veneer can swell enough to cause trouble, but there is the hitch. It may not swell appreciably parallel to the grain, but it can and does swell both in width and thickness. The swelling along the width of the grain may not cause trouble if the veneer is glued to a thick core, that is if it is plain straight grain veneer, but if it happens to be a piece of veneer having much end grain on the face it will check, while causing no change in the shape of the core. If, however, either kinds of veneer are glued to a thin core they will cause warping unless there is a similar veneer on the opposite side to counteract and balance the stresses.

The amount of swelling that takes place in the thickness of the veneer and cross banding when coming in contact with glue is considered negligible by some. It is small, in fact so small that it would be hard to measure the difference with the naked eye. But that there is a difference is conceded by many. It can hardly be seen on glancing over an unfinished top or panel that has had no, or little, drying after it was glued, but finish the top and then glance over it placing the panel in a horizontal plane between yourself and the window or a light. It will then be noticed there are many irregularities parallel to the grain of the face veneer and in case the panel, if it happens to be five or seven ply glued in one operation, the faint lines or irregularities of the cross banding may also be seen.

Cause of Irregularities

Some people are apt to become so calloused to seeing these irregularities that it becomes merely a matter of fact that all panels should do likewise.

Slight irregularities deflect light quickly when held toward the light although the difference may be imperceptible otherwise. It is quite similar to a window made of plain window glass. When you look at your reflected image it appears distorted and plainly tells you the surface of the glass is uneven. It distorts even though the irregularities can hardly be measured. It would be well if finished veneered panels had to be used for mirrors for then some peeople would awaken to the fact that the surfaces are uneven.

"What is to be done to prevent this?" you might ask, and the answer is simply, "Give your panels sufficient time to dry before attempting to surface them with a sander or otherwise". If you don't, you will make the panels even for a little while, but they will shrink in places as they become dry and cause unevenness.

Artificial Drying Best

If you do not have a small kiln for drying your veneered panels and do not wish to install one you can accomplish this purpose by piling the stock on stickers in a convenient location and allowing them to stand a sufficiently long time. The approximate time for drying a five ply panel in the open is approximately five or six days and seven or eight days for the seven ply. It must be understood that there must be circulation present because that it is what carries the moisture away, and unless there is circulation the air may become stagnated between the panels and some panels will dry very little.

This leads to the setting aside or making a room for this purpose and installing a fan or blower of some kind in order to get a positive circulation. Once you get this far you will begin to realize that a little heat will speed up the process and cut down the drying time. Heat and circulation will dry the panels, no doubt about it, but they may also overdry them which is in fact better than not drying them enough. To improve matters a little more it will be found profitable to humidify the room so that the panels cannot dry beyond the moisture content desired.

There are different ways of constructing a drying room, but to construct one and make it dry right with

out infringing any patents is another thing. In the long run it would not be much cheaper than to have experts construct one for you which will be correct in all details throughout. A properly made kiln, one in which the temperature and humidity can be controlled, can dry veneered stock in a much shorter period of time. In fact five and seven ply panels can be dried to six per cent in approximately two and three days if temperature is held at 120 F. and relative humidity at 35 per cent. One feature about most modern kilns is that they are provided with automatic regulators for both heat and humidity thus doing the work with very little attention.

How do You Dry Veneered Stock?

Furniture Manufacturers Turning to Special Kilns—Has Beneficial Effect on Production—Brief Outline of Main Requirements

S. H. Johnstone

The advantage and convenience of a special drying room for removing glue moisture from veneered stock and panels, is gradually being recognized by many Canadian manufacturers of panels and veneered products. In many furniture, phonograph, piano and panel plants, these special drying rooms are making their appearance. In some cases they are merely rooms in which the temperature is raised and maintained. Again, it may be found that an attempt has been made to create a circulation either through the introduction of a small fan, usually electric, or by connecting the exhaust ducts with the shavings exhaust system and thus taking advantage of the pull of the latter system. And in a few rare instances moisture or humidity is introduced to retard the surface drying and prevent checking or casehardening.

Behind all this is the realization that permitting veneered stock to stand around the shop to air dry, is too slow and too uncertain. Being slow, it acts as a drag or brake on production and often when a rush occurs the material is taken and worked up before it is sufficiently dry. Also being slow, a considerable amount of floor space is occupied by piles of veneered work which are drying out. The uncertainty creeps in owing to the variation in air conditions in the factory and to the fact that there may be little or no circulation. The result is that one time the glue moisture may be eliminated in a week, or ten days, while the may require and should get three weeks.

Stimulates Movement of Stock

One of the main advantages of a drying room in which conditions are kept more or less constant, is that definite drying schedules or times may be determined and followed, with a full assurance that the material comes out dry in every case. This permits a rigid adherence to production schedules and does away with any congestion which may have existed in the veneer department. It also enables the work to be pushed through the veneering operation without much delay.

There is nothing mysterious or secretive to the drying of panels or veneered pieces. The same principles which apply to the drying of solid lumber, hold good here. For the best results there should be heat, humidity and circulation, and each should be under control, either hand or automatic. Heat is usually supplied by steam coils, so arranged and placed that the temperature will be nearly uniform in all parts of the room. For drying work of this kind a temperature in excess of 120° is not advisable. In the case of animal glue, it is a good policy to hold the temperature around 110°. If it is permitted to pass the 120° mark, there is a possibility that the glue will be softened and may even let go in places. This, to say the least, would be diasterous.

Importance of Adequate Circulation

Circulation may be secured by the arrangement of the coils and the location of the intake and exhaust ducts. Usually in small drying rooms one or more electric fans are installed to stimulate the air movement. Without circulation, the drying is slow and erratic and the centre of the piles lag away behind the exposed surfaces. Circulation is absolutely essential and should be secured without fail.

Humidity is desirable. It serves the same purpose here as it does in the lumber drying kiln, that is, it retards surface drying and thus tends to eliminate any tendency toward casehardening or checking. Moisture may be introduced by steam jets. In some of the more elaborate systems this feature is under automatic control. Better results are secured when some attention is given to the humidity of the air. With a dry bulb reading of 115° to 120°, a satisfactory wet bulb temperature would be 95°.

Eliminates all Guessing

When the conditions in the kiln are subject to control and are maintained constant, it is an easy matter to watch the material. It will, probably, be found that three-ply will dry down to a low moisture content, say 6 percent, in from eight to twelve hours, five-ply may require twenty-four hours, while veneered work having thick cores may need as long as thirty-six hours. In the latter case, in fact with all kinds of material, it is only the glue moisture which must be eliminated for all stock, cores, crossbanding and face material should and must be thoroughly dry before laying. This may be taken as one of the first rules for success in the veneering operation.

It is most desirable that the drying be under close control the same as any other operation.

Matches Require Much Lumber

It is estimated that about 85,000,000,000 board feet of lumber are used each year for matches and toothpicks, the major part of which is for matches. Of this amount about 86 per cent is white pine and 7 per cent basswood, of which the matches are made. Toothpicks are made almost exclusively of beech, birch and maple.

When you increase the width of a band saw and use it for ripping purposes it is as well to increase the distance between the points of the teeth.

The contract for the chairs for the new Canadian Parliament Buildings, which is being handled by the Owen Sound Chair Co., Owen Sound, Ont., is nearing completion.

It is a fact that, with few exceptions, all manufacturers realize the value of time. Some kind of a system is invariably used in an endeavor to keep account of the hours of purchased and productive labor.

Some systems are good, others, although they are still used to a certain extent, have been proven time and time again to be inefficient and altogether inadequate to keep step with industry's progress You owe it to yourself and to your business to see that the system which is in use in your plant is at all time dependable.

International Time Recorders are absolutely dependable by reason of the fact that the time records they produce are mechanically accurate, legible and unchangeable.

International Job Recorders afford absolute assurance that the job time records are made at the time of starting and finishing of any job. Without this assurance cost figures cannot be accurately established.

International Time Recorders tell you exactly the amount of labor hours you have purchased. International Job Recorders tell you the amount of purchased labor hours which have been turned into productive hours; the combination of the two enabling you to reduce your non-productive hours to a minimum.

Time Recorder prices are back to bed-rock. Reductions ranging from $10 to $85 according to style and type of instrument. Now is the time to install this system. Will you let us demonstrate its many advantages.

Two carloads of chairs have been completed and are being shipped to Ottawa.

Rudd Brush & Lettering Co., Limited, Hamilton, Ont., were recently incorporated to manufacture and deal in brushes, brooms and other wooden products. Capital $40,000. Two of the incorporators are C. E. Ludd and C. S. Alyea, both of Hamilton.

Dean's Sunnyside Pleasure Boats, Limited, Toronto, have been granted provincial incorporation to manufacture and deal in boats, flying machines and other wooden craft with a capital of $300,000. J. Gilbert Dean and E. M. Dean are two of the incorporators.

Martin Motors, Limited, Montreal, were recently incorporated to manufacture and deal in trucks, flying machines, boats and other wooden conveyances. Capital $50,000. J. W. Cook, K. C., and A. A. Magee, both of Montreal are two of the incorporators.

W. S. Sugden, Vancouver, B. C., sent a unique wedding gift to Princess Mary. This consisted of a series of carved wooden panels, depicting pioneer and present-day life in Western Canada. Mr. Sugden is a disabled war veteran and is noted for his wood carving.

Jewett Phonograph Co., of Canada Ltd., Windsor, Ont., was recently granted a federal charter to manufacture and deal in phonographs, records and other accessories. Capital $950,000. Two of the incorporators are E. H. Jewett and J. M. Seymour, both of Detroit, Mich.

The Sheppard and Gill Lumber Co., Limited, Toronto, have been incorporated to take over the business of Sheppard & Gill Lumber Co., and to conduct a general lumber and wood manufacturing business, dealing in sash, doors and all kinds of mill work. Capital $150,000.

The Merritt Engineering & Sales Co., Lockport, N. Y., have issued an attractive pocket catalogue, showing part of their line of veneer and panel making equipment. Among the machines described are found; lathes, clippers, re-drying equipment, knife grinders and other machines.

Algoma Lumber Co., Limited, Wiarton, Ont., have been incorporated with a capital of $50,000 to manufacture and deal in sash and doors, portable houses and other wooden structures. Two of the incorporators are E. W. Geddes of Blyth, Ont., and J. J. Tyson of Wiarton, Ont.

Trenton Hardwood Flooring, Ltd., Trenton, Ont., were recently incorporated with federal charter to manufacture and deal in hardwood flooring and other wood products. Capital $49,000. Two of the incorporators are R. A. Allen, Millbridge, Ont., and J. B. Morgan, Trenton, Ont.

Durant Motors of Canada, Limited, Leaside, Ont., are planning an addition to their present plant. The new building will be three storeys, 80 ft. by 600 ft. When this extension is completed, which will be sometime this fall, the output of the plant will be increased to fifty cars a day.

An announcement was recently made covering the incorporation of the Heywood-Wakefield, Limited, Orillia, Ont., successors to the Lloyd Mfg. Co. This new company has taken over all the interests of the Lloyd Mfg. Co., manufacturers of the Lloyd loom woven line of wicker products.

Daniel Knechtel, veteran furniture manufacturer of Hanover, Ont., has offered to purchase the J. S. Knechtel residence in that town and present it to the municipality for a hospital. Mr. Knechtel also offers to donate $5000 toward equipping the building. It is probable that this offer will be accepted.

The North American Furniture Co., Limited, Owen Sound, Ont., contemplate throwing open their new showrooms to the public and thus giving the citizens of Owen Sound an opportunity of examining the high-class furniture produced by this company and its associate, the Owen Sound Chair Co.

Wm. J. Markle, who for several years was with the Boake Mfg. Co., Toronto, has been appointed manager of the lumber yard and planing mill of the Consumers' Lumber Co., Hamilton. He succeeds M. B. Zimmerman, who resigned to organize the Norwood Lumber Co., Hamilton, which recently entered the wholesale and retail lumber field.

The Canadian Brill Company, subsidiary to the J. G. Brill Company, Philadelphia, Pa., who took over the Preston Car and Coach Co., Preston, Ont., are now working at capacity, engaging 250 employees. They have recently delivered cars to the cities of Toronto, Winnipeg, Victoria, B. C., and conductors' cabooses to T. & N. O. Railway Commission.

J. W. Stone Boat Manufacturing Co., Kenora, Ont., are experiencing considerable demand for their product. They have constructed a large number of skiffs and launches. Recently the company commenced the construction of a large boat for the department of Indian affairs. The contract was secured in competition with the large eastern boat builders.

J. A. Minchner, manager of the North American Furniture Co., Owen Sound, Ont., returned recently from a visit to Grand Rapids, Mich. He stated that while conditions in the Canadian furniture industry were far from ideal they were better on the whole than on the other side. Mr. Minchner is hopeful of considerable improvement in the next month or so.

George Rathbone, Limited, Toronto; Watt Milling & Feed Co., Limited, Toronto; Haley & Son, Limited, St. Stephen, N. B., and S. Anglin & Co., Kingston, Ont., recently joined the Millwork Cost Bureau, of Chicago, as a direct result of the meeting of woodworkers held in Toronto recently, a report of which was published in the February "Canadian Woodworker."

J. B. Torphy, Boston, Mass., is covering the Canadian field in the interests of Richey, Halsted & Quich Co., Cincinnati, who handle a high grade line of Southern hardwoods. Mr. Torphy is steeped in lumber lore having been connected with this industry for the last fifteen years. Before making his present connection he was with Wistar, Underhill and Nixon of Philadelphia, Pa.

An item in the February "Canadian Woodworker" concases and store fixtures, have been awarded a contract for tained the information that the contract for doors for the new Prince Edward Hotel, Windsor, Ont., had been awarded to the McLean Lumber Co. of Windsor. This is not correct. W. J. McKee, of Windsor, Ont., was the successful tenderer and has since delivered the full complement of doors.

Meyers Lumber & Mfg. Co., Limited, was recently organized to manufacture and deal in wood products of all kinds and to carry on a retail lumber business. They are erecting a plant in North Toronto and are in the market for considerable equipment. A temporary office has been secured at 15 Toronto St., Toronto. W. Warren, who for the last few years has been in charge of the West Toronto Branch of the R. Laidlaw Lumber Co., is managing director of this new concern.

The number of schools, including high and technical schools, which are going up in different parts of Canada, should create a good market for wood products of various kinds. Not only is a high class of woodwork required for these bulidings, but school furniture of various types must be purchased as well as special forms of woodwork. Recent reports intimate that plans are being prepared for a high school for Scarboro Township, Ont., to cost $125,000, and one for Athens, Ont., to cost $50,000.

James Roberts, Wilton Court Hotel, Toronto, has been appointed permanent Canadian representative for the Mat-

THE KRAETZER-CURED LUMBER CO.

Your Protection—Our Guarantee

Kraetzer Curing—What It Is

Kraetzer Curing is simply the modern and more efficient application of the treatment of wood relied upon by the artisans of the earlier periods in the construction of their master pieces of cabinet work. Even, now, after the elapse of centuries, we still frequently encounter such pieces in a perfect state of perservation.

This treatment is even more beneficial to Gumwood than to the woods employed in those earlier times. Kraetzer Curing immediately eliminates the sap and gelatinous substance in the wood. It also completely does away with fermentation and the resulting strain and decomposition, which by some is considered a necessary and deterring evil.

Likewise, Kraetzer Curing makes the sap portion of the wood more dependable than the Heart or Red Wood. It can then be used for practically all purposes with equal or greater satisfaction than Red (or Heart) Gum, Birch, Maple or other woods. It is available at materially lower prices.

Send for the Kraetzer-Cured Booklet, and write or wire for quotations.

The Kraetzer-Cured Lumber Co.

Canadian Blower & Forge Co.
KITCHENER, ONT.

tison Machine Works, Rockford, Ill., Baxter D. Whitney & Son, Inc., Winchendon, Mass., and the Jenkins Machine Co., Sheboygan, Wis. Mr. Roberts has covered the Canadian field on several occasions and looks forward to renewing old acquaintances and making new ones. He is one of the most widely known machinery salesmen on the road to-day, having sold woodworking equipment in various parts of the United States, in Canada, Europe and Australia.

The Annapolis Hardwood Co., Limited, was organized in 1920 and is now conducting a flourishing industry at Annapolis Royal, N. S. Applewood specially processed for handsaw handles, was the first production. The firm also began selling hardwood lumber across the border and this led it into another venture, that of making hardwood flooring. Up-to-date dry kilns of the humidity type and modern machines were installed. During the first year of operation over a million and a half feet of lumber were consumed, while this year it is expected that the two million mark will be reached.

According to a recent despatch, W. E. Phillips, Limited, Oshawa, Ont., a newly organized company, have secured an option on the plant of the Thornton Rubber Co., of Oshawa. It is understood that as soon as the necessary transfer papers are filed, the new organization will commence rebuilding and refitting the plant for the purpose of manufacturing woodwork, mouldings, mirrors, etc. If present plans go through, this plant will be operating by May 1st. To start, employment will be given to about 50 men but it is anticipated that this will be rapidly increased to from 150 to 200. Col. W. E. Phillips, D.S.O., M.C., formerly of Kingston, is in charge of the new company, and R. S. McLaughlin, of McLaughlin Motors, is one of the directors.

According to figures recently issued by the Department of Labor, Ottawa, wages in the woodworking industry did not change very much during 1920; in fact the average is about the same, some lines showing a slight increase while other classes of work have dropped a little. In the sash and door industry the average hourly wage for bench hands during 1920 was 55 cents, while for 1921 the hourly rate was 54 cents. 1920, 44 cents, 1921, 44 cents. In the furniture field rip sawyers were paid an average of 46 cents an hour; in 1920, and 43 cents an hour in 1921. Wood turners received 48 cents an hour in 1920 and 48 cents an hour in 1921. Cabinet makers show a slight increase of 42 cents for 1920 and 44 cents for 1921; benchmen 44 cents for 1920 and 39 cents for 1921.

English Oak Extremely Durable

The durability of English oak is the greatest of any known forest timber, discoveries having been made that it is preserved almost as well under water through centuries as it is when shielded by roofs in ancient castles.

Prof. Burnett, of London, possesses a piece of English oak from King John's palace at Eltham, perfectly sound and strong, which can be traced back for more than 500 years. The oaken shrine of Edward the Confessor is more than 800 years old. One of the oaken coronation chairs in Westminster Abbey has been there for more than five centuries.

In Gloucester cathedral there are 31 stalls of rich tabernacle work executed in oak in the reign of Edward III, and beautifully perfect. When the foundations of the old Savoy palace in London, built 700 years previously, were torn down, the piles, many of which were of oak, were found to be in a state of perfect soundness. A vessel, found in the River Rother in Kent, said to date back to the time of King Alfred, was found to be sound, despite the fact that its oaken keel had been buried in the mud. An oak boat was also found near Brigg in an almost perfect condition, despite the fact that it was nearly 200 years old.

In the Hardwood Field

Flood conditions are threatening many of the important southern hardwood producing sections. Heavy rains have forced the closing down or severe curtailment of logging operations, and, as most of the mills had only scanty log supplies, manufacture is also being restricted. The Memphis and Valley territory is in immediate danger from floods. Warnings were issued early this week for the principal rivers in Arkansas, and most of the streams in Mississippi and Louisiana were even then out of their banks, with little chance to discharge their surplus waters before the flood waters in the Mississippi itself have abated. Consequently vast lowland sections are covered with water, making the woods more or less entirely unworkable for an indefinite period. In fact, few loggers expect to be able to resume operations on the former scale before thirty to sixty days. The hardwood market in the meanwhile remains quiet, tho demand undeniably is steadily increasing, and the situation is markedly improved over that of two or three weeks ago.

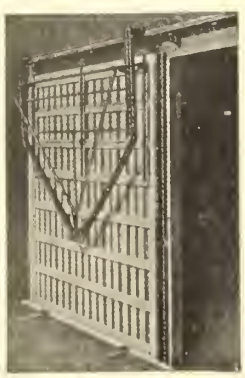
The Door Carrier System



Makes your dry-kiln doors steam-tight and saves time, heat, trouble and money.

Carrier lifts door clear of kiln and carries it down track. Returning, deposits door to rabbeted joint, where it is held steam-tight by its own weight. Applicable to old or new kilns.

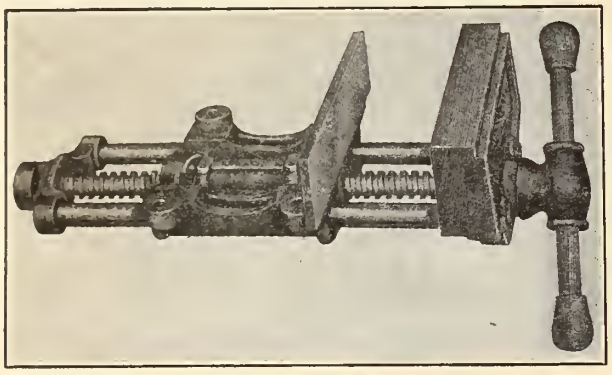
The Vise You Swear BY not AT



On the Market for 15 years.

Globe Vise & Truck Co.

GRAND RAPIDS, MICH.

We also manufacture a complete line of steel trucks particularly for wood working factories. The body of our truck is absolutely indestructible, and there are no nails nor screws in the top to mar material, whether finished or unfinished. The roller bearing feature in the wheels allows for much easier handling than the old style plain wheels on the wood truck. In fact one man can handle much more material than on the old style. The price is very little more than that of the old style wood trucks.

The Load You Can't Estimate

NO matter how great is the foresight of the machine designer, he cannot guard against unexpected thrust loads on the bearings caused by conditions beyond his control.

The Deep Groove Bearing can withstand thrust loads greatly in excess of its radial capacity and coming from either direction.

Both the design and quality of this double purpose bearing are endorsed by the mark **SKF** and are backed by the world-wide researches and long experience **SKF** Industries.

This experience is at your disposal and you are urged to submit your bearing problems to us for free and impartial advice.

A GREAT COMBINATION

THERE is no more direct, certain, way to sanding efficiency in your plant than by having good men working on good machines and using Carborundum Brand Garnet Paper and Cloth.

You are thereby always assured of an increased production, better finished products, a saving of the time of labor and a consequent lessening of sanding costs.

It's a great combination made possible because—

CARBORUNDUM BRAND GARNET PRODUCTS
MAKE GOOD SANDERS BETTER SANDERS

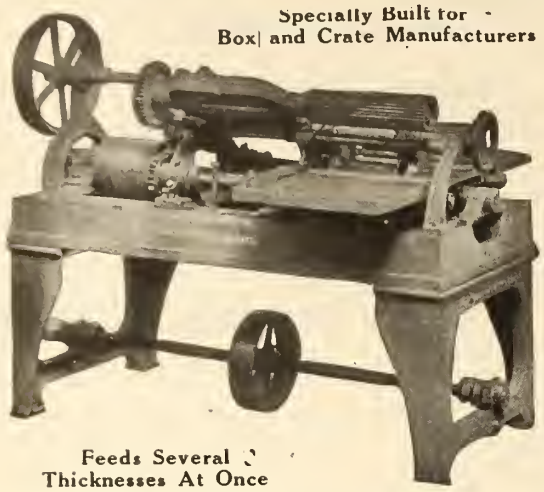
"The Chattanooga" — Just Another Name For Fast, Economical Gang Ripsawing

Specially Built for Box and Crate Manufacturers



Feeds Several Thicknesses At Once

This latest improved gang ripsaw is powerful, fast, safe and eliminates wastage. For gang sawing boards into strips or head sticks and for ripping veneers it is unsurpassed.

Has powerful feed and securely holds down and feeds short pieces. The feed rolls are automatically adjustable to varying thicknesses. Upper rolls are driven by cut gears, and the lower ones by sprocket chain. Several thicknesses of veneering can be fed thru machine at one time.

The CHATTANOOGA is an unusually big producer, easily operated, and turns to profitable account short stuff lying around a mill—otherwise wasted.

Attractive price. Complete information on request

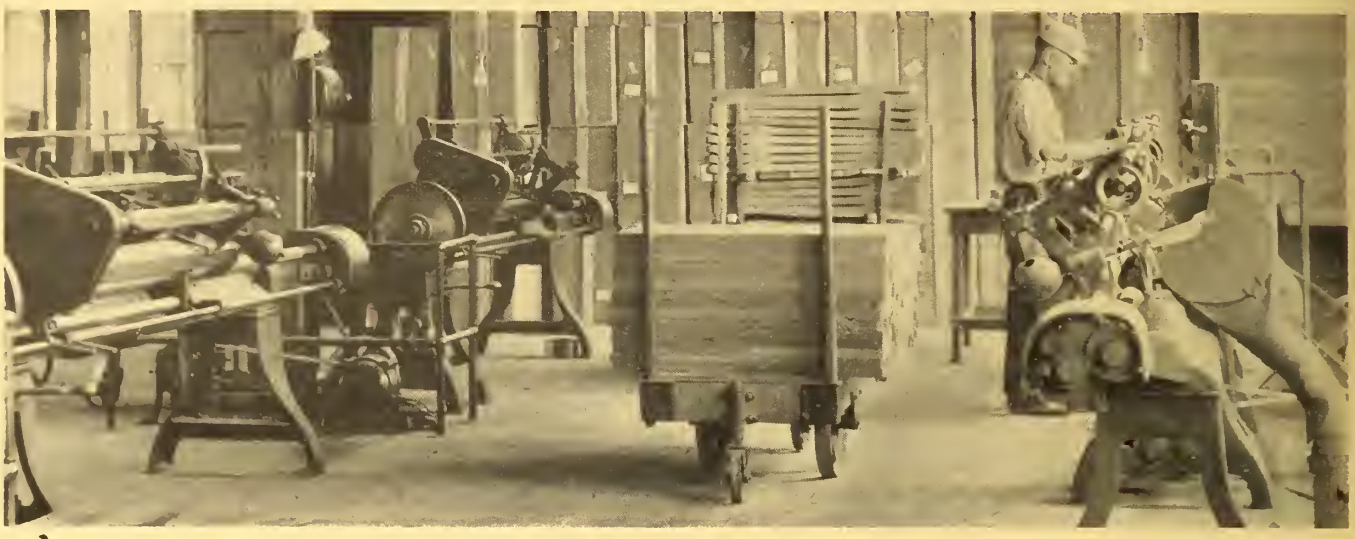
Makers of Sterling Saws

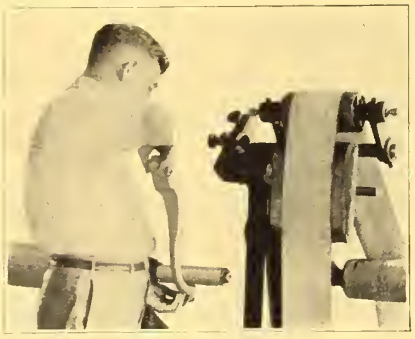
Factory—HAMILTON, Ont. Vancouver Branch—109 Powell Street

One Man Shapes and Finishes Queen Anne Legs



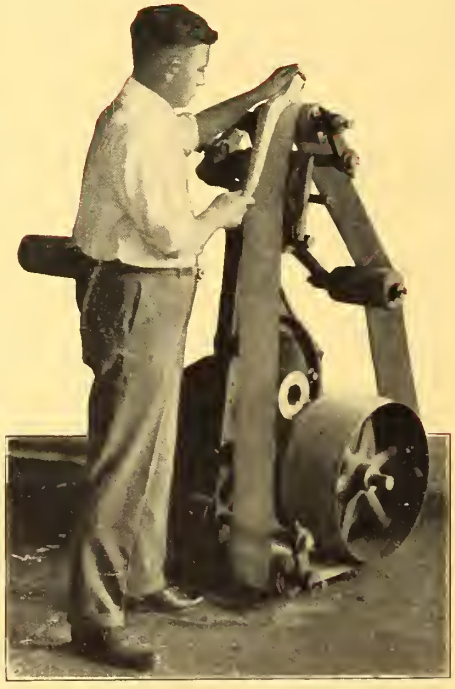
The manufacturer of Queen Anne styles can now produce the legs at exceptionally small labor cost. One man can look after the automatic leg-forming lathe in connection with the operation of the belt sander or other machine; or as many as four of the lathes can be handled by one man, because the cutting operation is purely automatic.

The Combination Makes an Efficient Method



Pneumatic sanding drums supply just the right resiliency for cleaning up the extreme curves.

FOR your beautifully designed cabriole patterns there is no other machine so well suited as the Mattison "214" Automatic Leg-Forming Lathe. It is specially designed to produce the irregular-shaped Queen Anne legs accurately and at a minimum labor cost. The cutting operation is purely automatic which reduces the labor to the actual time required to change stock. The man who tends the lathe can sand a leg on the "115" Belt Sander while another is being cut on the machine.



Sanding flat curves against cushioned sanding roll

The flexible open belt nicely finishes the rounds.

BY free-hand manipulation of the leg diagonally against the open sandbelt, shaped forms or cushioned sanding rolls, the rough sanding is accomplished very quickly. The two sizes of pneumatic sand-covered drums provide a most practical and accurate method for perfectly finish-sanding the legs. This combination of both rough and finish sanding operations in the one machine together with the lathe for automatically shaping the legs, gives the manufacturer of Queen Anne furniture a method that minimizes costs and insures accurate production of his individual and distinctive patterns.

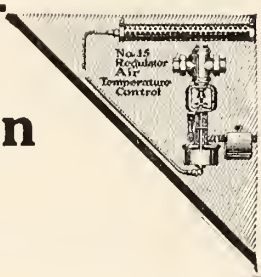
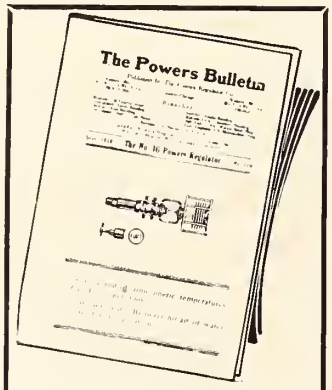
Everything in Woodworking and Metal Working Machinery



"Let Us Reason Together"

You know that it costs you money every time your dry kiln gets too hot—or the temperature rises too rapidly.

But—Do you know that Powers Automatic Heat Regulators offer a sure means for saving you that money? They do, and we want to prove it to you in your own plant, under your own working conditions. It will save you much lumber if you will accept this offer.



Powers Bulletins give concise, accurate information about automatic temperature control, etc., for glue pots, dry kilns, drying rooms, hot water tanks—and many other places where expense can be saved.

For more than thirty years we have been solving heat regulation problems with automatic control. Our experience is at your service.

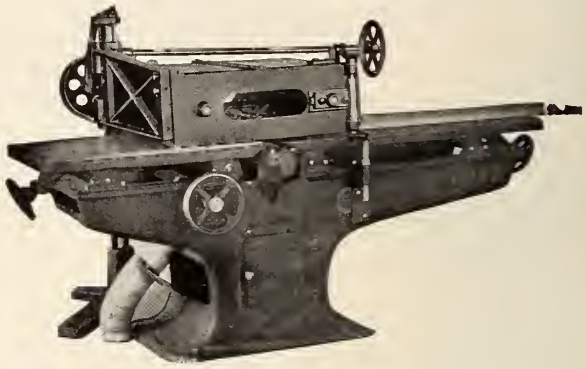
CONSERVATION OF MEN AND TIME



One of the greatest movements of recent years was the "Safety First" campaign and as witness of its efficiency there are many less maimed men among the rising generation of wood-workers.

It has developed that incidently with the introduction of safety devices came a marked increase in production. A certain nervous strain felt by the operator of a dangerous machine militated against his capacity.

Among the most dangerous of wood-working machines were the jointer and buzz planer, but both were rendered harmless by the

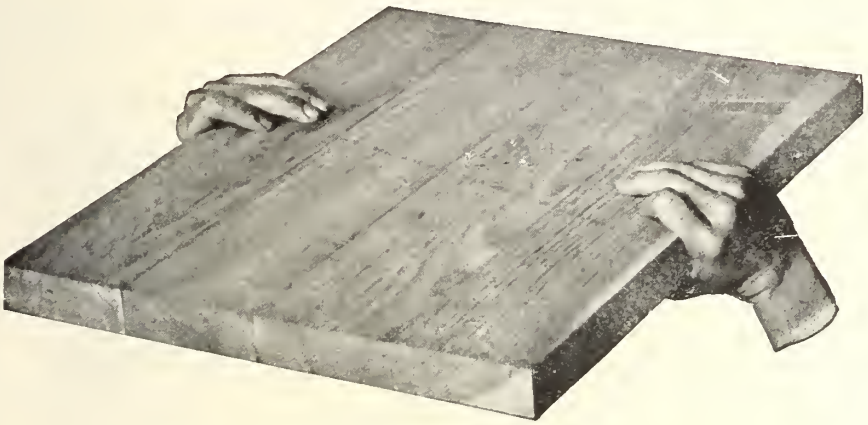
Billstrom Automatic Feeder,

the use of which rendered it impossible for the workmen to get his hands near the knives while the machine was running.

It was also found that the resilient metal fingers fed the stock faster and more uniformly than could be done by hand, resulting in largely increased production.

But a moment is required to place the feeder in position for work, or to swing it back to free the knives when they need attention.

N. J. BILLSTROM
2002 Ninth Street
Rockford, Ill.

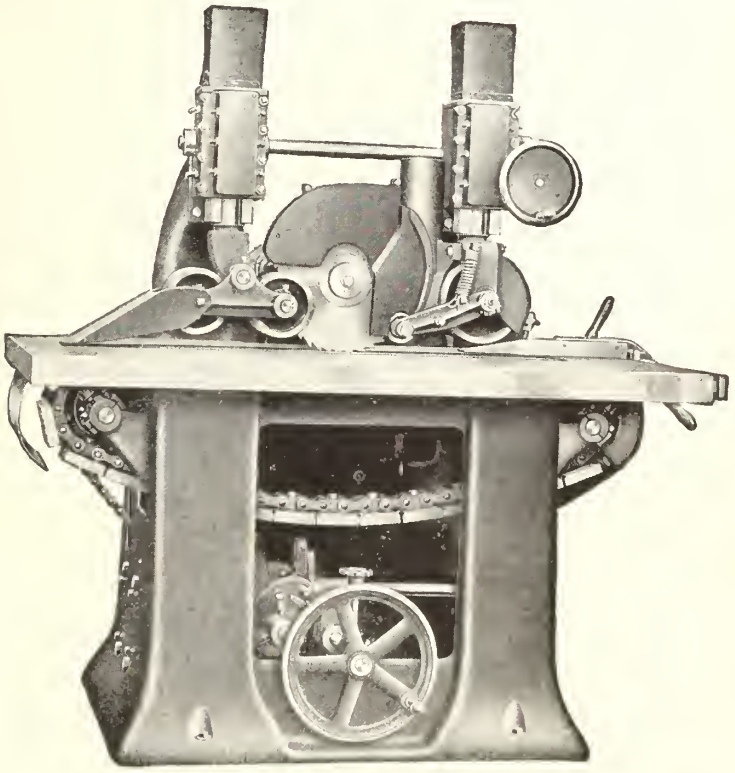


Yates

The machine shown on right is our type G-2 Ripping and Edging Saw.

This saw will cut a perfectly straight line without the use of a ripping guide.

The cut above shows the perfect joints that can be made on this Saw. In the preparation of cored stock for veneered work, such as veneered doors, panels, table tops etc. this saw gives the lumber such a smooth, straight, even cut, that subsequent jointing is unneccessary to give a satisfactory glue joint. The saw arbor is mounted in combined thrust and radial ball bearings. This fact, together with the roller and ball bearings used in the feed rolls assures a smooth-running, highly efficient machine under all conditions.

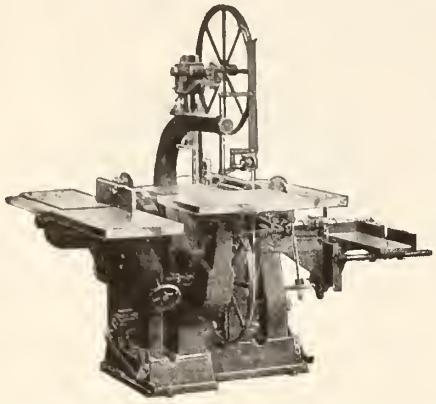


Our illustrated circular outlines the many uses this machine can be put to. Simply drop us a line for your copy and obtain information that will be of benefit to you.

P. B. Yates Machine Co. Ltd.

Hamilton - Canada

Crescent Universal Woodworker

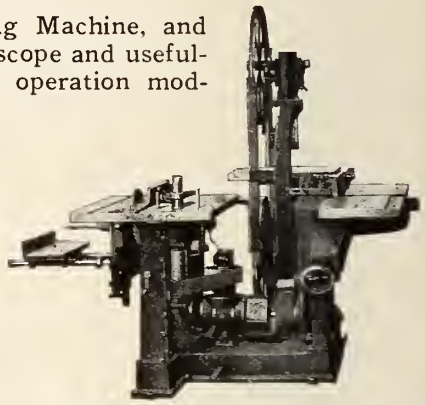


Saves Time and Earns Money

To the builders and contractors contemplating large building operations this coming season the Crescent Universal Woodworker will mean a large saving in mill work beside the convenience of having material cut and finished on the job when and where they are wanted. The sawyer's time alone will pay for the machine in a short while.

Every Builder Should Have This Money-Making Machine

Standard equipment includes:—Band Saw, Saw Table, Jointer, Boring Machine, and Shaper. A number of other attachments ca n be added to increase the scope and usefulness of the machine. Floor space is limite d and power required for operation moderate.



Write for further information.

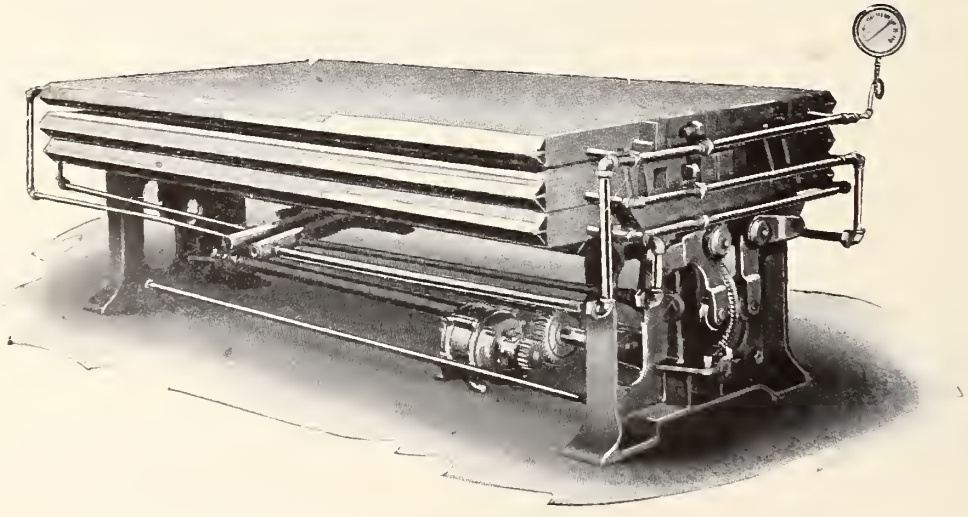
IF ITS MACHINERY WRITE "WILLIAMS"



The "Merit" Three-Plate Veneer Re-Drier

has two openings only and is designed for plants having need of a re-drier of moderate cost and of limited capacity.

The machine is electrically driven and is piped for connection with the factory steam line.

A vertical movement of the middle plate gives the veneer pressure first in one opening and then in the other and provides the well-kown "Breathing Movement" peculiar to Merit Re-Driers.

MERRITT ENGINEERING & SALES COMPANY
Lockport, N. Y.

MESCo

The "Merit"
Re-Drier
FOR VENEER

INSURE your veneer work against surface checks, hair lines, blisters, warping and glue failure by installing a "Merit" Re-drier.

Thoroughly dry and flat veneer avoids these troubles, gives tight joints and saves glue.

No system of air drying will accomplish this result. Hot Plates with "breathing movement" are the thing.

MERIT

The Shimer Round Safety Cylinder with High Speed Knives

A Round Safety Cylinder that will Appeal to the Buyer and the User for three Reasons:

The first is our adjusting nut for setting the knives. It is the only cylinder with properly located adjusting nuts for setting the knives, which, with our way, can be set to 1-1000 of an inch.

The second is our way of holding the knife without tapping into the head.

The third is the correct angle of cut for the knives.

Made for Any of the Different Makers' Machines and in Any Length Cylinder.

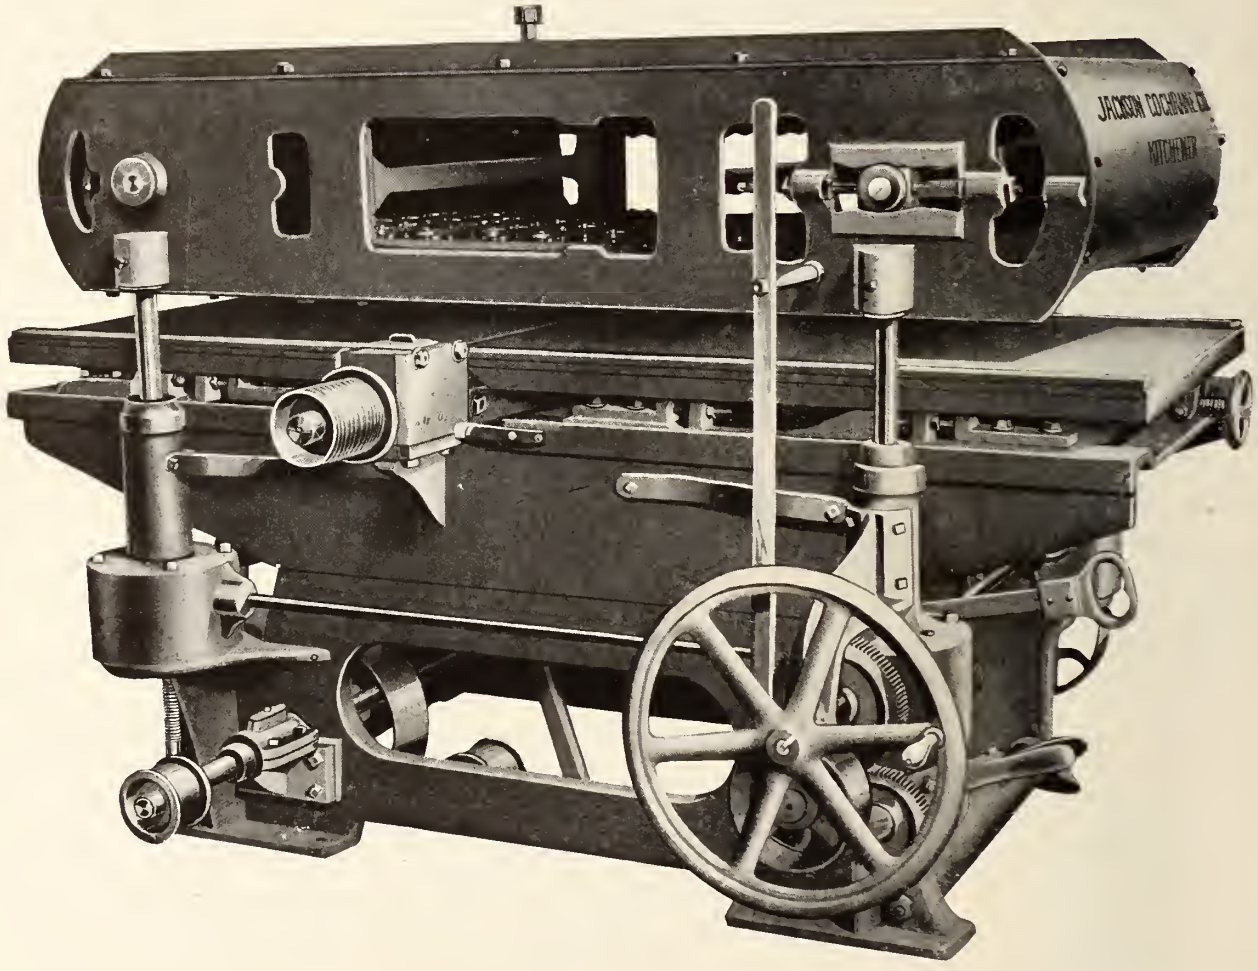
"The Best Equipment Possible for the Work it is Intended to Do"

-Says *Panels, Limited*

of Southhampton, Ont.



This machine not only increases production while lowering operating costs but entirely eliminates the dangers to which the operator of the old style buzz planer was subjected.

Just consider these facts:

It handles stock of any dimension, hard or soft, at four times the speed of the old method; occupies but one fourth the space required by four hand jointers; requires but one-fifth of the sharpening of the knives as the hand fed jointer and is easily operated by two boys.

These facts we shall be glad to prove to anyone interested in such a machine.

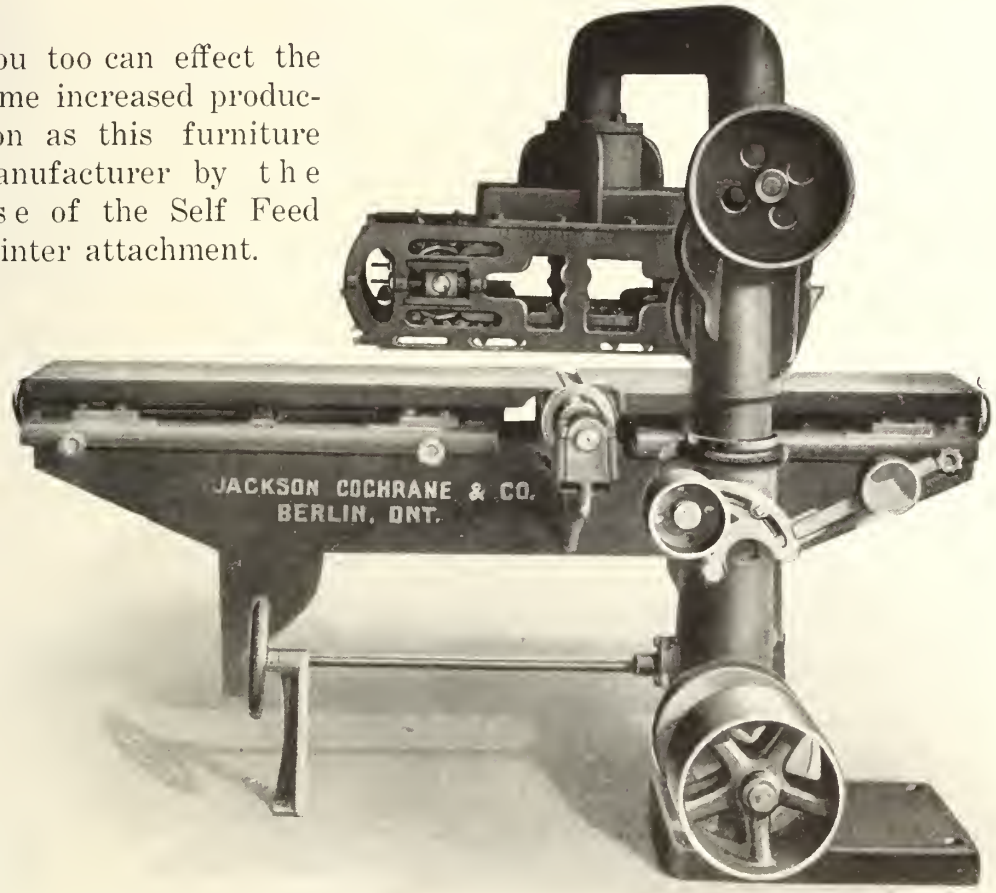
Read over the article on the Herzog Self-Feed Jointer contained elsewhere in this paper.

Jackson, Cochrane & Company

KITCHENER - CANADA

"We can Feed from Two to Three Times as Fast as Formerly"

You too can effect the same increased production as this furniture manufacturer by the use of the Self Feed Jointer attachment.



For factories having but one or two jointers and desiring to use same at times for squaring or edging, this Herzog Swing Out Jointer Attachment is especially desirable, as the attachment can be quickly swung free from the jointer.

It is of the same general design as the four post machine except that the feed is shorter and is hung from a single post. We guarantee this machine to increase the capacity of the hand fed jointer from THREE TO FOUR TIMES.

One user writes "We would not be without this machine as it has proven one of the very best machinery investments we have made."

Read over the article on the Self-Feed Jointer Attachment contained elsewhere in this paper.

The Handiest Machine on the Market

The Split-tilting table (Patent Applied For) can be tilted and locked at any angle up to forty-five degrees as indicated on the graduated segment. This machine is also supplied with a solid table. The Boring Attachment is very complete in itself. A foot lever is connected with the table which slides back and forth on the knee. A large coil spring located in the column of the machine automatically releases the work from the bit when pressure is removed from the foot lever. The Boring Attachment is raised or lowered by means of a handwheel connected with a pair of mitre gears. The spindle is bored to take standard size bits and can be arranged for a hollow chisel mortiser. Special cutters may be used by removing the throat in the table. Each machine is furnished with one ten inch saw, belt and wrench.

Write for prices and pamphlet describing this time and labor saver more fully.

GUELPH, ONT. CANADA

Cross-cut Mitre & Rip Saw Machine showing Split-Tilting Table & Boring Attachment

What is the Most Essential Thing to Consider in Purchasing Dry Kiln Equipment?

We would say that the very most important thing to be considered is the fact that the value of the lumber dried in a kiln during a year is at least ten times as great as the cost of the kiln, including buildings, equipment and installation.

Perhaps you have always considered the "PRICE of EQUIPMENT" to be the most important phase. But if one kiln will do the work better than others, its value as a manufacturing facility is such that it does not make any difference whether it costs more or less than some other equipment.

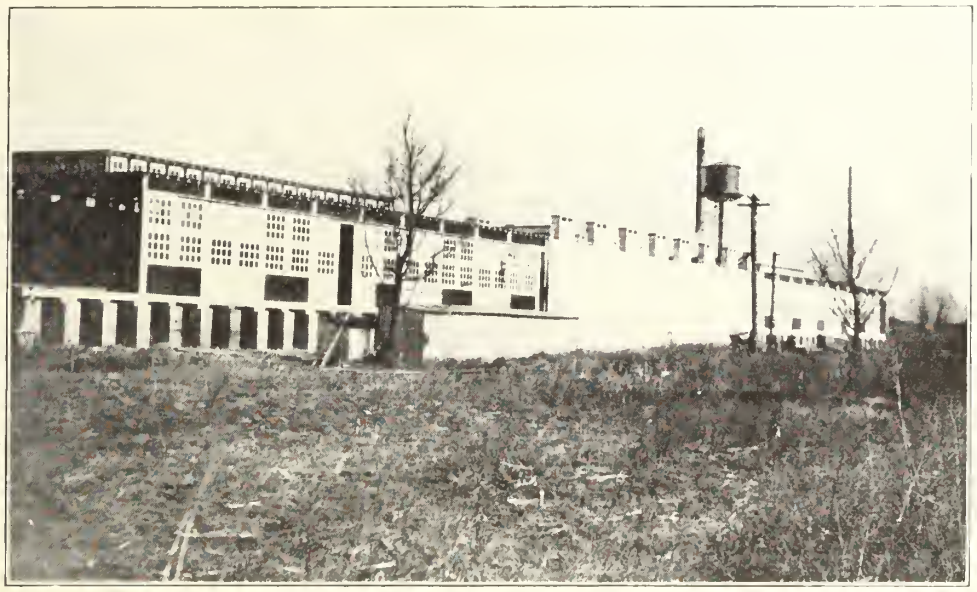
In fact, if only ten per cent of the gross amount of lumber is damaged in one kiln because of poor facilities, the kiln which will save this ten per cent pays for itself every year.

Now, if the prospective purchaser of dry kiln equipment does give consideration to this most essential point, then, of course it devolves upon him to select this better kiln. He can not do this by selecting the highest priced kiln, or the lowest priced kiln, or on any price basis.

You understand the serious problems of lumber drying sufficiently to know that in your kiln you must have power, distribution, flexibility and control to do the work properly. You know there is a difference in the way these things are provided by various kiln engineers.

NATIONAL KILNS ARE DIFFERENT in that they have:—

1. More Abundant Power.
2. Better Distribution.
3. Most Flexible Arrangement.
4. Automatic Control.



We will guarantee to cure your lumber to your entire satisfaction, without degrade or waste, in the least possible time and at a minimum cost in operation. Whether in need of a new kiln, or the remodeling of your present installation, kindly write us to-day.

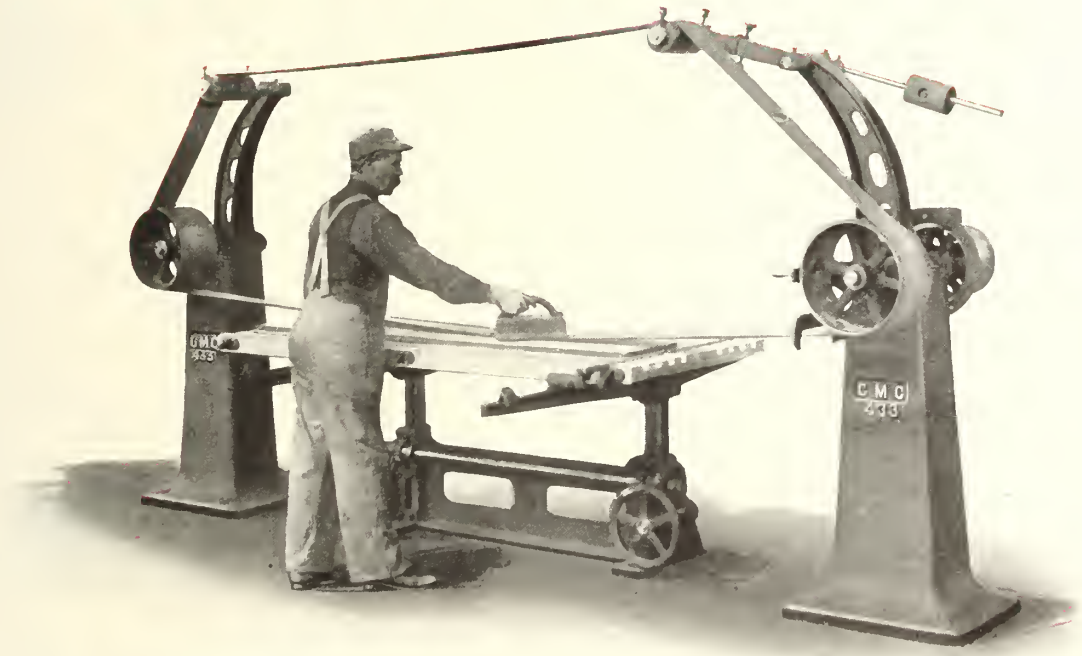
Power Sanding with the Human Touch



C.M.C.

No. 433 Hand Block Belt Sander

This Sander combines that perfection of finish that can only be obtained by the human hand and eye with power production.

No other form of sanding machine yields itself to so many and varied uses. The small job, and the large job—flat work or irregular work—all come within its range.

A green hand can operate it. He soon " gets the feel" of the block and a little experience soon makes him as good as the best.

Complete details on request.

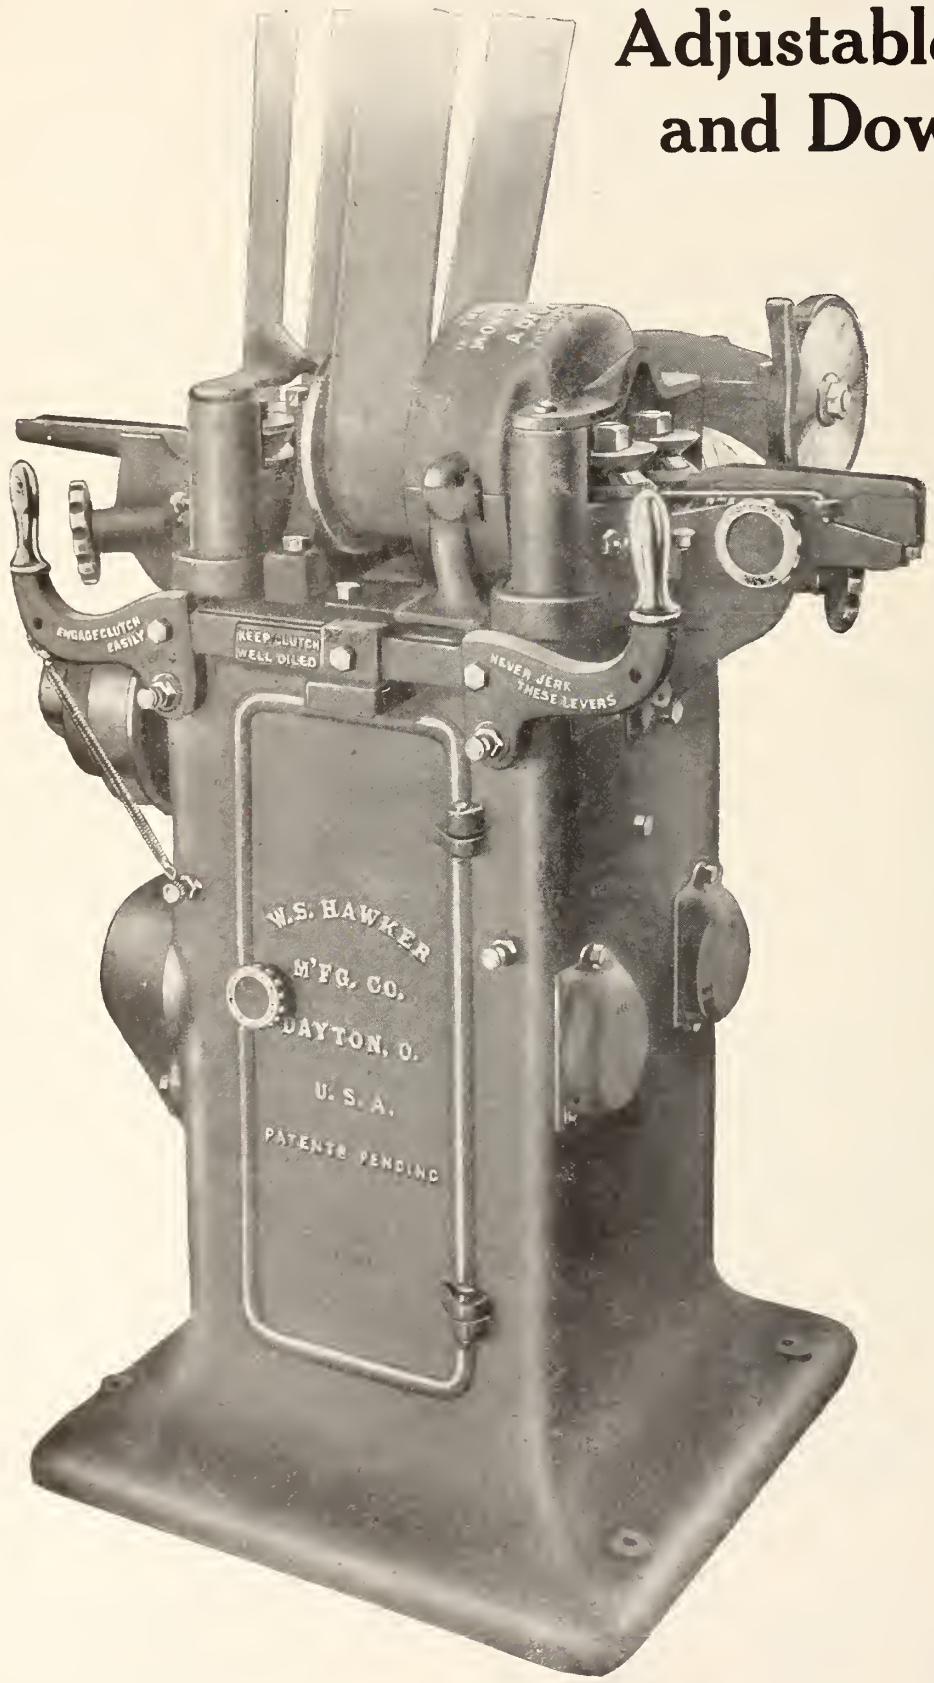
The Money Maker—
Adjustable Rod and Dowel Machine



Capacity 30,000 to 40,000 lineal ft. per ten hours on 7/8 or 15/16 mop or sweeper handle stock.
If you are using any dowel machine of less capacity, figure your daily losses in labor and business.
Write us what dowel sizes you turn, and whether hard or soft wood. Ask for our demonstration proposition to show you how to double your production of dowel stock at the same labor cost.

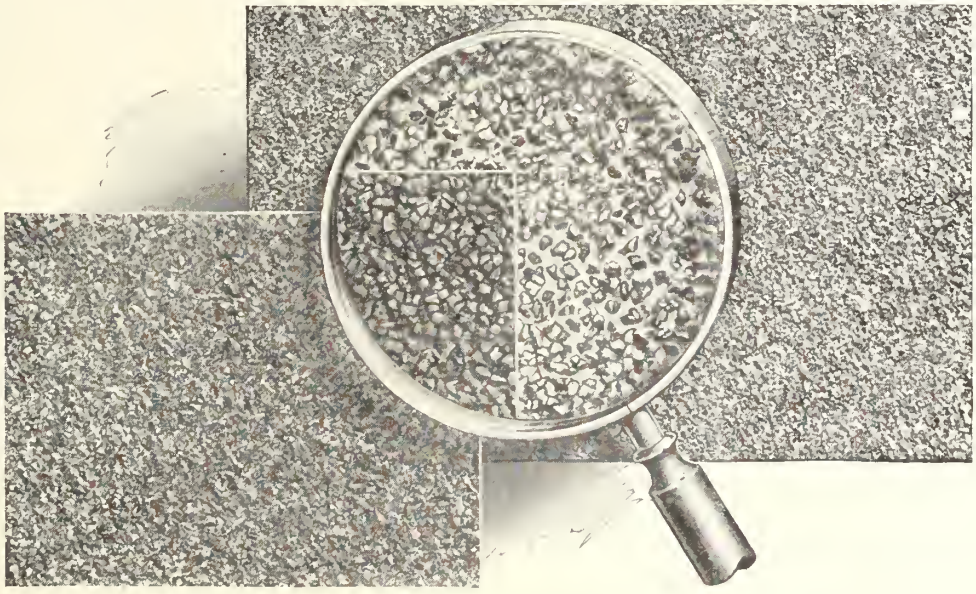
The machine that is sent under a guarantee to show you a gain of from 100 to 400 per cent before you buy it.
The improved dowel machine that 90 per cent of the largest and oldest machinery builders and dealers now endorse and recommend in preference to the solid chuck machines they themselves previously built.
One cutter head turns from ¼-in. to 2-in. diameter.
Turns hard or soft wood equally well.
Handles heavy, oversized squares.
No choking of the cutter head.
Smooth stock.
Accurate sizes.
Works stock as short as five inches.
Rolls automatically center variations in squares.
Machines built to turn from ⅛ to 6-in.
We want to hear from every user of a solid chuck dowel machine.
We can save you from one dollar out of every two, to four out of every five that the operation of solid chuck machines costs you.
Engagements for competitive test solicited.
Formal orders not solicited. All sales made after demonstration.

The only question is, are you willing to cut cost of your dowel turning to one-half or one-third of what it costs with any make of solid chuck machine?
Machine delivers the goods before you buy.
State conditions of stock closely
Special conditions require special equipment.

W. S. Hawker Mfg. Company, Dayton, Ohio

Behr's OPENKOTE Garnet Finishing

Will Double Your Finishing Output



Sandpaper becomes useless when the "valleys" between grains fill up with dust or shavings—long before the kernels wear off. Behr's OPENKOTE Garnet Finishing, shown at the right, is made with *twice* as many and *wider* "valleys" than ordinary papers.

The greatest progress in the development of sandpapers and abrasive materials during the past generation is illustrated by the difference between the papers still in use and Behr's OPENKOTE Garnet Finishing.

Instead of heaping a mass of kernels upon one another and producing a wavy, uneven surface, the Garnet kernels are scientifically spread so that each grain can do its full quota of work. The invention by this Company in 1918 of the OPENKOTE Process of applying kernels of abrasive to paper, has made it possible for you to secure a new quality of sandpaper that will doubly outlast the old types of finishing papers still in general use.

OPENKOTE is flexible, light and easy to handle. Its cutting and lasting qualities are so vastly superior to the ordinary papers that OPENKOTE will do *twice* as much and faster work. The wide valleys and even distribution of grains insure complete dust clearance and the smooth, even surface prevents scratching.

Years of exhaustive experiment and trial have proven these facts beyond doubt. Send for samples of OPENKOTE for comparative tests with the paper you are now using; a post card specifying grades desired will bring them to you, without charge.

DOUBLE SPINDLE RADIAL BORING MACHINES

This machine is the standard of the furniture manufacturing world. It is finished with accuracy and combines versatility with never failing reliability.

The table is actuated with a central connecting rod, preventing the bureau drawer effect. The large intermediate gear is supported at any position by the large segment on the rear of the column. This rigid support eliminates the vibration set up by the action of the teeth and materially prolongs the life of the spindles.

A new **Close Center Attachment** has recently been perfected. It is universal and will bore two 5/16" holes anywhere in a circle of 1¼" with minimum centers of ½".

The new **Quick Action Clamp** attaches to the fence and eliminates the old stick.

Remember we can bore all of your holes at one time if you so desire

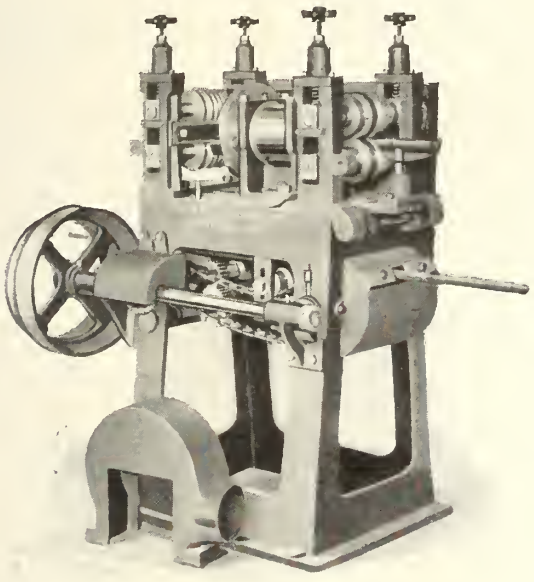
Make Your Own Dowels With the "BELL" Machines

The Fastest and Most Practical Equipment For the Purpose



Adjustable Rod and Dowel Machine

The fastest dowel machine in the world.

Constructed to withstand the heavy and constant strain to which this type of machine is subjected.

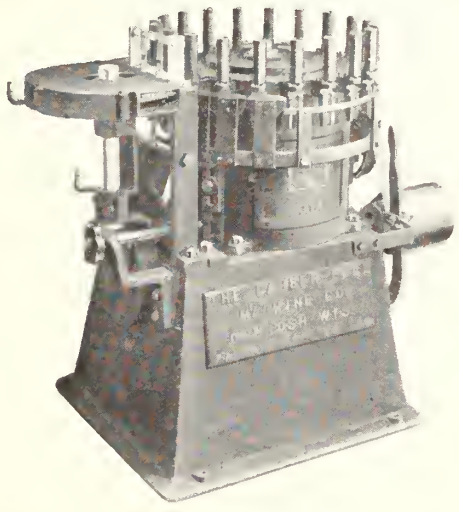
Equipped with a universal four-knife cutter head adjustable to turn rods of all diameters from ¼" to 2" in either plain, spiral groove, longitudinal groove, or imitation reed wind. Special machine for turning rods of larger size.

Cutter-head mandrel is mounted at each end in ball-bearings of the highest grade.

Out-going feed rolls have combination of grooves so that many sizes can be made without changing feed rolls. The in-going feed rolls are adjustable for all sizes of squares.

Will work stock as short as 4½ inches.

Furnished with countershaft or motor drive.



Dowel Cutting Off and Pointing Machine

This machine is for cutting off and pointing dowel pins from long rods.

It will cut and point dowel pins of all diameters up to ¾", and in any length up to 6 inches.

Capacity of this machine is from 300 to 400 pins a minute. Any boy can operate it.

All working parts are completely enclosed and thus protected from dust and dirt.

Absolutely no danger to operator.

The floor space required by this machine is only 22" x 36".

Tight and loose pulleys on machine.

Furnished with belt or motor drive.

DEPENDABLE

Good glue is a vital necessity in the manufacture of any product having glue in its make up. To be good it must be dependable every day in the year. **Perkins Vegetable Glue** is dependable because every pound of material that enters into its make up is carefully inspected and the finished product is uniform in quality.

Process and Product Patents covering Perkins Glue were granted July 2nd and March 19th, 1912, and have been held valid and infringed by the United States Circuit Court of Appeals. Patents have also been granted in Canada, Great Britain, Germany, France, Belgium, Italy and other foreign countries.

Corner posts and end of an Egyptian Mummy-case now in the Berlin Museum—2700 years old.

MONITE WATERPROOF GLUE, the modern scientific perfection of ancient casein glue, surpasses the glue of Egypt just as the modern steel and aluminum automobile excels the clumsy cedar and bronze chariot of the Pharaons.

Panels and Glue-Joints 3,000 Years Old!

The following is translated from pp. 56-7 of "The Story of Furniture" ("Geschichte des Mobels") by A. Koeppen and C. Breuer, published at Berlin in 1904.

"The Ancient Egyptians already employed the art of ennobling an ordinary wood by gluing on thin layers of costly woods. For example, the corner posts of a large mummy-case now in the Berlin Museum are overlaid with a veneer almost one centimeter thick—as can clearly be seen where a small part of the veneer is broken off."

"To bind together smoothened wood surfaces, the Egyptians used, even as it is customary today, curd glue, a mixture of casein and caustic lime—which glue has the advantage of being insoluble in water."

Egyptian furniture, jewel caskets and coffins taken from ancient tombs to modern museums, prove that the Egyptians used waterproof glues made from casein at least 3,000 years ago! Many specimens of glue-joined furniture, veneers and inlaid work of precious metals, ivory and rare woods, **made with casein waterproof glue, are still in excellent condition after 30 centuries.**

Glue joints and panels made today with **Monite Waterproof Glue,** the modern scientific perfection of the waterproof casein glue used by the Egyptians, will endure for centuries.

Monite Waterproof Glue costs but little more than vegetable glues, is as strong as the best hot glue, is mixed and applied by machinery or by hand, requires clamps for only 3 or 4 hours, **glues wood with high or low moisture content, is mixed and used cold produces panels and joints that are heat and water proof.**

British Columbia Lumber Commissioner

Display rooms and offices have been removed to 51 YONGE STREET (Ground floor)

where a complete display of British Columbia forest products will be installed, including several rooms to full scale, finished in BRITISH COLUMBIA WOODS and completely furnished, showing exterior walls and roof of British Columbia red cedar with thatched roof effect. Also, a complete display of every grade of all British Columbia woods in commercial sizes and a complete line of British Columbia boxes and RED CEDAR SHINGLES.

You are cordially invited to call and see our exhibit.

Main 6872 TORONTO 51 Yonge St.

CHRISTOPHER COLUMBUS, contrary to the advice of all his friends, in the fifteenth century set out on a journey for the wonderful west and discovered America, then an unknown country.

Why do you not therefore let us have some of your business? Then you will have discovered a new source of supply, unsurpassed as to quality and service and at prices absolutely in keeping with the character of merchandise furnished.

In after years we think you will look back on this with as much satisfaction as did Chris' followers on his achievements.

Why not get in touch with us?

WE ARE TELLING THE PUBLIC: "BE SURE YOUR WALNUT IS REAL WALNUT."

AMERICAN WALNUT

"The Cabinet-wood of the Ages"

WE ARE TELLING THE PUBLIC: "BE SURE YOUR WALNUT IS REAL WALNUT."

In Constant Demand

Every maker of furniture, interior trim and cabinet work knows that there are times of "craze" for particular kinds of wood—periods of "peak" demands for certain varieties.

These swings of popular taste go from wood to wood, with more or less regularity. But you never saw a time when there was not a steady, regular demand for Walnut furniture of the better class, did you?

Isn't that the best evidence that whatever you make in "Reel American Walnut" is certain of a ready sale?

Partly from tradition and history and partly because of our nationl advertising, there are more people who appreciate the values in Walnut and are demanding its use than ever before. You never have any trouble in selling anything that you make from "Real American Walnut," because the **value** of it is readily recognized and fully appreciated. Real Walnut is always a "sure fire" seller.

You will find some valuable marketing data in our Walnut Book.
We will gladly send you a copy without charge or obligation.

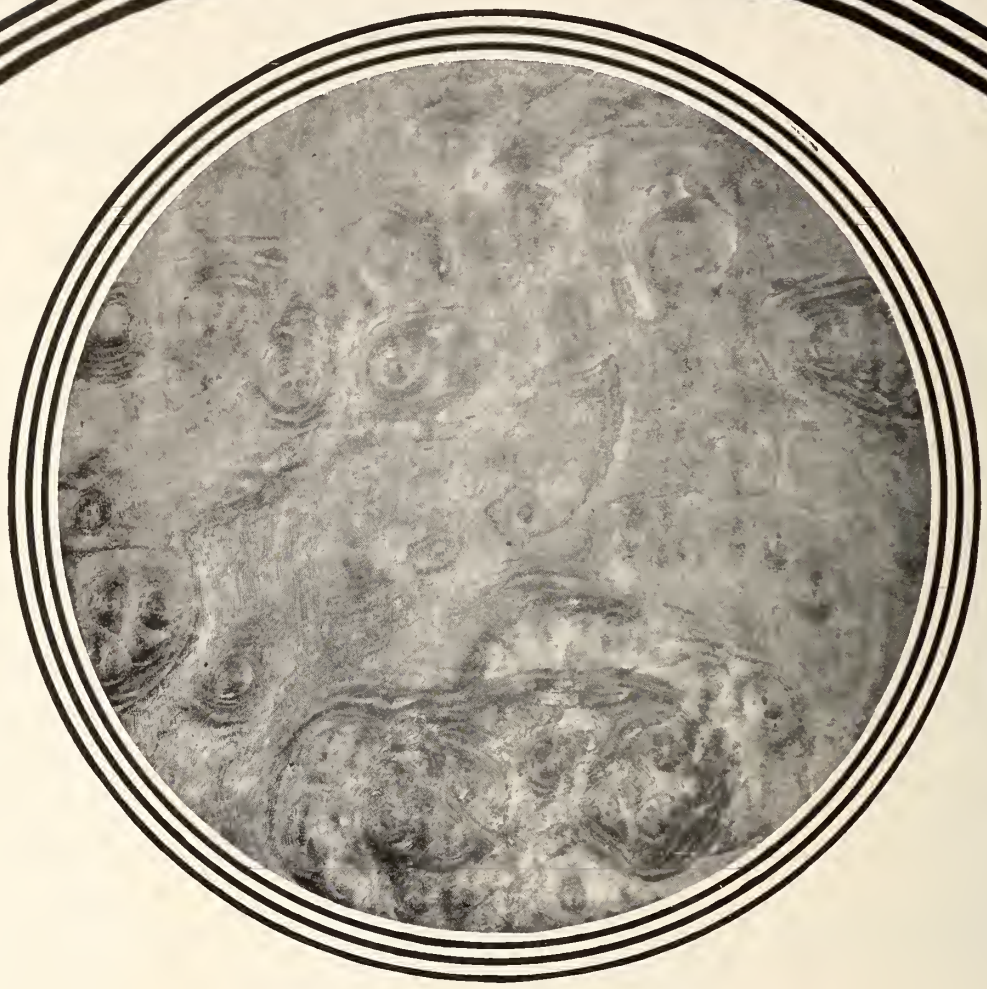
BARR-HOLADAY LUMBER CO.

BAND MILL AT LOUISE, MISS. GREENFIELD, OHIO



IOWA
WALNUT

Grown in the deep, rich, black loam of Iowa's river valleys, buffeted by the stress and strain of her winds and changing climate, walnut grown in Iowa has developed a strength, fineness, and beauty of marking that experts declare is equaled by no other walnut. Only the finest of Iowa grown walnut trees are used in cutting IOWA WALNUT.

If you need Walnut lumber or veneers let us send you some further evidence of the quality of Iowa Walnut and quotations on some unusually fine lots now available.

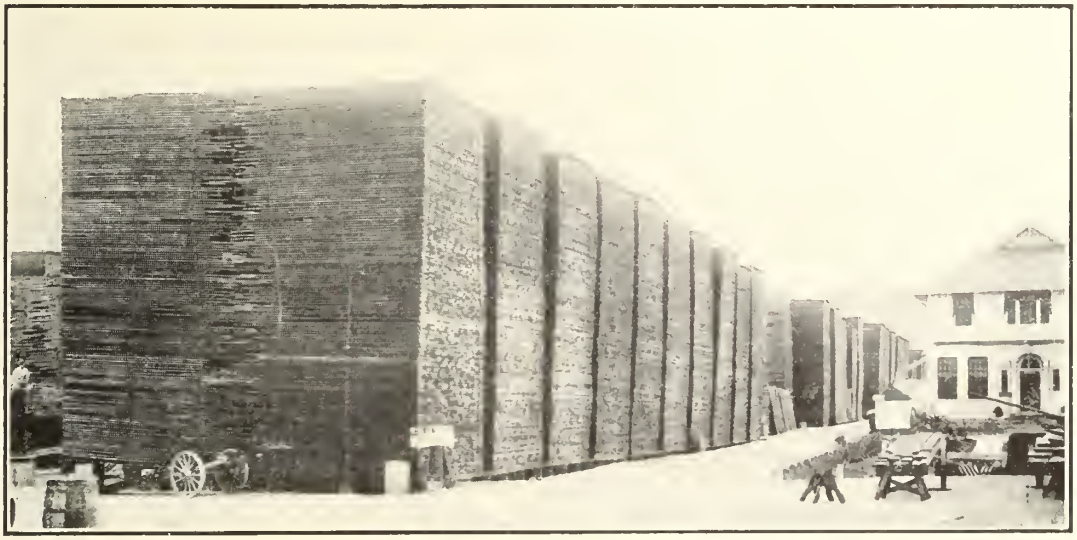
MAHOGANY



Rarely are such stores of precious wood to be found as may be seen in our yards. Across the seas from tropic lands it comes. From thick jungles where the light of day but dimly penetrates and where tangled native paths make difficult the bringing out of timber. Here the black man labors, risking life from jungle dangers, that supplies will not diminish and your orders may be filled.

Twelve million feet per year is the capacity of OTIS mills. An adequate supply is always on hand for prompt shipment. Get our prices.

Specialty E C & S Birch

Canada's Leading Manufacturers

use Northern Birch supplied by Edward Clark & Sons Limited

THE fine texture, the ease with which it works and the truly beautiful grain of this northern hardwood is well known to the manufacturers we serve.

An example of this is the pleasing Vanity Dresser, made by the Dominion Furniture Manufacturers Limited, St. Therese, Quebec.

Furniture of this type is getting its full share of present day business and is growing in popularity every year.

We can supply you with any quantity of Northern Birch expertly manufactured and graded to National Hardwood Lumber Association standards—at surprisingly low prices, quality considered.

ESTABLISHED 1871

Oak Red Gum

Why Bruce Hardwoods Excel

For many years before we became hardwood lumber manufacturers, we were makers of fine Oak Flooring and are to-day the largest individual producers of that material.

The producing of good Oak Flooring is an exacting science—where perfection is attained—and teaches the value of both skilful grading of raw material and accuracy in milling.

With a full appreciation of the value of these factors, we entered also upon the manufacture of southern hardwoods and in the operation of this department, have applied them in the production of all items in white and red oak, gum, ash and other species.

With our joint facilities, we are equipped to ship square edge parquetry strips, oak trim and mouldings, as well as Oak Flooring in the same car with hardwood lumber.

Inquiry and correspondence invited.

Can Shrinking be Prevented?

An article which appeared recently in a contemporary contained misleading and incorrect information pertaining to the shrinkage of lumber during the drying operation. In this treatise, the writer, F. H. LeMont, made the following statements; "You can practically eliminate all shrinkage of lumber in thickness and width. When properly kiln dried, six months air dried boards calipered thicker when they came out of the kiln than when they went in. Correct drying would almost eliminate this shrinkage from the green size of the board and therefore save at least 10 per cent of the lumber."

Now a ten per cent saving on all lumber going through the kiln is well worth considering, but in this case the manner in which the saving is to be effected is in direct opposition to the best kiln-drying practice and is not practical. To eliminate or even reduce the shrinkage which ordinarily occurs the wood itself must suffer. The tendency for lumber to shrink as the moisture leaves it, is a natural movement, similar to the shrinking and expanding of metals through the application of heat or cold, and as such cannot be prevented or eliminated. It can, however, be resisted and the outside dimensions held to size, by casehardening the outer surfaces early in the drying period. When this is done either the shrinkage occurs in the centre of the pieces injuring the fibres and causing interior checking and honeycombing or internal stresses and strains are set up, through the fibres attempting to shrink, which seriously impair the value of the wood.

The Forests Products Laboratory, Madison, Wis., was asked to outline the results of their investigations along this line. Their reply, which follows, is clear and emphatic and does not leave much doubt as to the effect of attempting to resist shrinking:

"This entire matter of shrinkage has come up a number of times. While it is possible to vary the amount of shrinkage in wood by means of different kinds of drying treatments, I think I am safe in making the broad statement that wood dried in the kiln in such a manner that it will be free from drying stresses and drying defects will have shrunken at least as much as if it had been air dried to the same moisture content. The statement, often made that the slower and milder the drying treatment the greater the amount of shrinkage is probably correct, if one considers straight drying only. If, however, steaming treatments are also taken into consideration the situation becomes considerably more complex since the persistent use of high temperature drying coupled with frequent steaming treatments will produce an unusually large amount of shrinkage.

"As a matter of fact, the shrinkage will, in general, be somewhat greater than that secured in air seasoning on account of a slight tendency in the case of the air dried material to set in an expanded condition, a tendency ordinarily overcome in kiln drying by means of steaming and high humidity treatments. So far as our experience goes, any treatment which causes the stock to set in an expanded condition, such as for instance a very rapid surface drying of green stock, is extremely liable to produce checking and honey-combing, and is almost sure to result in stresses which are so severe that they reduce the usefulness of the stock very materially."

The drying of lumber by artificial means is an extremely important operation and a considerable amount of money may be saved or lost in this department. Few plants are securing the results they should or could secure from their dry kilns. In the average furniture factory, for instance, drying costs are needlessly high, either because the kiln itself is not properly designed or equipped or because it is not operated in an intelligent manner. The result is that losses from checking, warping, etc., take a high toll; strains and stresses in the dried lumber make trouble in various ways and the drying periods are unnecessarily long making for high drying costs. It would be far better to attempt to place the drying operation on a more efficient basis than to give much thought to such impractical suggestions as the prevention of shrinking.

Each issue of the "Canadian Woodworker and Furniture Manufacturer" contains a practical, instructive article dealing with some phase of the kiln drying operation. These are prepared by men of wide practical experience and should prove helpful to all who maintain a dry kiln. In this connection the "Canadian Woodworker" welcomes requests for information dealing with any phase of the drying operation. Send in an outline of the drying troubles you are experiencing. The result may surprise you.

Wood Toy Industry in British Columbia

Circumscribed by Smallness of Local Market—As Freight Rates are Lowered and Adjusted Will Compete for Trade of Prairie Provinces—How Millar & Coe, Limited are Developing

By Geo. S. Perry, Vancouver

With wood production its chief, and heretofore its most important industry, from point of view of value of annual returns, it is somewhat surprising that British Columbia has not so far come to the front in the manufacture of wooden toys, which at all times, and never more than now, have a great vogue with the younger generation. Considering the rapid strides made in so many lines of manufacture in the Pacific

R. M. Millar, President, Millar & Coe, Limited, Vancouver.

province, and very particularly in woodworking industries, the lack of expansion in the important industry of making wooden toys is still more surprising.

It is not to be taken as a criterion that two factories have been started in the past three years, both of which have succumbed to the stress of establishing a market in face of keen competition. Nor is the fact that at least one of these factories had the support and financial assistance of the B. C. Government's Industrial Department any indication of what the wood toy industry will do to any one who has the nerve to attempt it in British Columbia..

Makes Lines Suited to B. C. Woods

One toy factory, not started with any great flourish of trumpets, and not assisted by any Government loan, has made good in the past two seasons in Vancouver. Mr. R. M. Millar, president of Millar & Coe., Ltd., explains how his firm made a venture in wood toy making which has proven successful, and which gives indications of expanding as time goes on. It is just as well to point out that a long experience in the retail and jobbing trade in Vancouver has given Mr. Millar an insight into what to attempt and what to leave alone. In confining his factory work to lines best suited to B. C. soft woods, and not attempting others where hardwood is best, his firm has found its success. Also in making only the best classes of goods, and not, so far at any rate, attempting mass production, safe policy has been followed.

"At first," said Mr. Millar, "we only made up stock for our own store. Good wooden toys are always popluar, and are possibly the best sellers. Our plant even now is not a pretentious or expensive affair. We put in jig-saws, a lathe, cut-off saw, and similar machines, and while we keep some men employed all the time, it is only in advance of the Christmas trade that we start to make up any quantities of stock.

Produce Attractive Variety

"We have made, among many lines, wooden swings, small boats and canoes, for which the B. C. cedar is well adapted, children's bake boards, wooden vehicles, such as locomotives, with trains of cars, toy autos, etc. But where hardwood is most suitable or durable, we still buy in Eastern Canada and other markets. For example, the well-known 'kiddie kar' made in an Ontario factory, is one of the most widely advertised of toys. It is made of hardwood, and the Ontario Maple is better suited than B. C. fir for such a toy. There is another consideration too. That is the freight rates. Until a fair adjustment of the freight rates is arrived at, wooden toys made in B. C. could not even reach the prairie provinces on a competitive basis let alone any advantage through being local production. Of course that freight question applies to all our manufacturers in this province to a great extent.

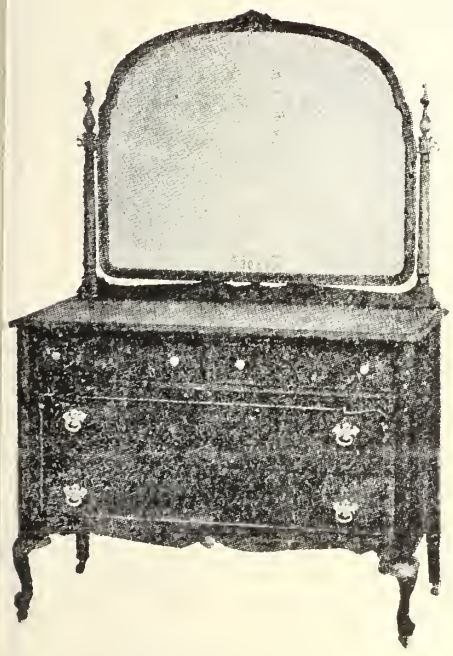
"So far as our local market is concerned," replied Mr. Millar to a question, "it must be remembered that there are only 500,000 people in the whole province. While we first started making toys for our own trade, we have found a very good demand from outside points, and have begun to fill orders from many parts of the province. As that trade grows we may extend our operations, and may even consider going into mass production. This we have avoided so far because of the comparatively small local market, and have confined ourself to making the high-class goods. We have not, for instance, attempted making rocking-horses, because the makers of those, in the U. S. turn out such huge quantities we could not hope to compete."

Look Forward to Steady Growth

"We have only been in the toy making business for a little over a year, and have gone very slowly, feeling our way carefully. Still, we have every confidence that in time the manufacture of wooden toys for which B. C. woods are suitable, will become a large industry, and as we can develop and enlarge our market outside of Vancouver, our small plant will naturally be increased," was Mr. Millar's concluding remark.

The tenoning machine can be easily safeguarded and it is sheer carelessness to leave the cutters exposed so that they are a danger to anyone passing by

When Your Competitor Undersells You

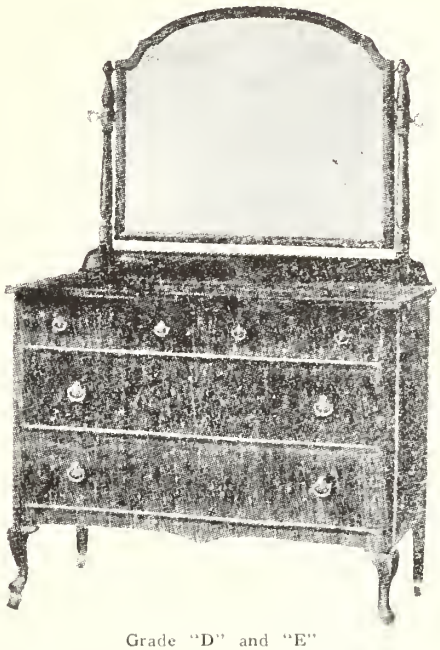


Grade "B-1" and "C-1"

Which Dresser Would You Rather Make at $40.00?

Appearance or Comparative Similarity Does Not Determine Value.

Costs Compared Showing Reason for Difference in Price.



Grade "D" and "E"

How often, when opening your morning's mail, have you been startled by a report from one of your representatives to the effect that so and so is making a piece of furniture very similar to your No.—and selling it at a price much lower than yours? Such is not infrequent occurrence if one may judge from the remarks of different furniture manufacturers. Often when an incident of this kind occurs it is the signal for a miniature price war. Practically every furniture manufacturer prides himself on his ability to manufacture and sell as cheaply as his competitor, with the result that he resolves to "show the other fellow" even though it is going to cost him some good money to do so and at the same time tend to undermine the confidence of the retail trade.

When an occasion like this arises the furniture manufacturer is badly handicapped for he has not seen the piece in question, being forced to rely on the report of the salesman or retailer and is, therefore, not in a position to judge as to the value of the article his competitor is offering. In almost every case a thorough examination and comparison of the two items in question would disclose the reason for the difference in price.

Quantity Production May Enter

At the present time the majority of furniture plants in Canada are being operated along fairly efficient lines and as a result it is difficult to understand how one can undersell the other to any marked degree. Of course if one manufacturer is selling at a price which retails a loss, it is only a question of time before he will be faced with the necessity of increasing his prices. Apart from the question of value given, the influence of quantity production on costs must not be overlooked. Suppose two furniture makers are producing a dresser which is very similar in appearance and value. These are being made in each plant in lots of 50 and offered for approximately the same price. Suppose one manufacturer finds or believes that by reducing his price he can secure sufficient business to warrant him cutting in lots of 500. Is it not possible that the savings effected through running in larger quantities, would enable him to make the same profit per piece at a much lower price, provided, of course, that both methods and equipment are adapted to quantity production.

Deliver Only Value Sold

The example of the two dressers shown herewith is entirely different. While to all appearances there is little to choose between the two pieces, yet there is a big difference in price. The purchaser secures just what he pays for in each case. According to A. C. Brown, secretary of the National Alliance of Case Goods Manufacturers, dressers similar to these were sold at the Grand Rapids market for from $40.00 to $70.00 each. To quote Mr. Brown further, "The most surprising thing about this was that no one, buyer, factory manager or salesman, seemed to get greatly excited over the situation. The fact is that the buyer will get what he paid for and in practically every case the seller will make a profit on what he delivers."

"Never before was this matter viewed so sensibly as during the last market. The reason, no doubt, is that both buyer and seller are giving consideration to the fact that as a rule the manufacturer is only delivering the value that he sells, and it is becoming generally understood that no manufacturer can for any length of time, deliver more than he is paid for and remain in business.

How Value Varies in Each Grade

"It is also a fact that retail buyers are studying grades more than ever before and are not influenced to as great an extent as formerly by the price alone.

"The value of goods should be measured from the units that are to be used when the goods are sold to the ultimate consumer. If suites are sold then they should be judged as suites and bought as suites after careful consideration as to value. It does not seem to be good policy to judge a suite by the dresser or buf-

fet alone without regard to the value of the assembly as a unit."

An examination of the cost figures shown will indicate why there is a difference in price and value even though the pieces are very similar in appearance. When made to B 1 grade specifications the material consists of solid walnut, five-ply figured walnut top with rimmed edge, five-ply figured walnut front, five-ply plain walnut ends, three-ply mahogany drawer bottoms, three-ply mirror and case backs, one-ply dust bottom. C 1 specifications call for quartered red gum, five-ply plain walnut top with rimmed edge, five-ply plain walnut front, five-ply plain walnut ends, three-ply mahogany drawer bottoms, three-ply case and mirror backs and one-ply dust bottoms. Dropping to grade D specifications, the case is made up of quartered sap gum ,five-ply plain walnut top, no rim, three-ply plain walnut front, three-ply ¼" plain walnut ends, three-ply gum drawer bottoms, and three-ply case and mirror back. Grade E is made up of quartered sap gum, five-ply walnut top, three-ply walnut fronts, three-ply ¼" walnut ends, three-ply case back, one-ply drawer bottoms, one-ply paper mirror back. A comparison of these items will show that in each case the purchaser secures good value for what he pays, but no more.

If a furniture manufacturer knows that his costs are reasonable, that his methods and equipment are such that he can produce a dependable product as cheaply as his competitor, he need not worry very much about the prices others make. If certain of his competitors are underselling him, it can almost be taken for granted that they are selling at or below cost, which is a very poor policy. It is far more profitable to concentrate on one's own problems, to try and improve one's own methods, to keep one's own plant as efficient and up to date as possible than it is to give any thought to what others are doing.

C. L. Willey Company not Corporation

In the advertisment of the C. L. Willey Company, Chicago, manufacturers of hardwood lumber and veneers, which appeared on page 87 of the March "Canadian Woodworker and Furniture Manufacturer," the name of this progressive concern was given as C. L. Willey Corporation instead of C. L. Willey Company. Although the C. L. Willey Company, is incorporated, its corporate name is "company" and not "corporation." The difference may appear trivial for although the company is a corporation and a corporation is a company, yet "Smith" and "Smyth" sound the same yet neither Mr. Smith or Mr. Smyth likes to have his name mis-spelled.

As the fault was ours, we take this opportunity of acknowledging our error and offering our apologies to the C. L. Willey Company for the mis-spelling of their name.

How to Put Your Plant on Efficient Basis

Some Points Covered

Standardization or "One Best Way"—Time Studies and Adoption of Standard Times—Planning and Routing Department—Advantage of Monthly Cost Statements

By L. G. CATTERMOLE*

It is necessary that all vital information relative to the manufacture and sale of the product, and the finances of the enterprise be compiled in such form that they provide immediate records for the use of managerial control. No plant should make itself liable to being crippled through the loss of any single individual, who may have a knowledge of the operation of that business which the management does not have.

In the early stages of management engineering installation it is advisable to inaugurate time study work. This is for the purpose of setting rates, and providing time allowances for planning the work through the factory, as well as determining group and departmental capacities. Whether or not this work is done by the local plant personnel, or by engineers placed in charge of the work, must be determined after a thorough knowledge of local conditions has been obtained. If the right calibered men are available in your organization, it is sometimes better to have them do this work under the engineer's supervision, particularly if a large amount of detail work is involved.

Part Stock Store Room

It is desirable, when manufacturing standard, interchangeable parts, and when deliveries are desired within too short a time to manufacture the product complete after receipt of the customer's order, to maintain part stock store rooms. This reduces the work-in-process inventory of the product "in the white," or completed with various finishes. Commonsense must be the governing factor in this, as in all other methods. In checking over the part stock of a large table factory it was found that a sufficient number of certain parts were on hand to last for 65 years at the normal rate of demand.

Store rooms should also be established for tools, patterns, templets, etc., so that they can be kept in the best possible condition, and be instantly available for use.

It would be impossible, in this brief survey, to begin to cover the subject of Standardization—or as F. W. Taylor expressed it "the one best way"—in the woodworking industry. Suffice it to say that this field is one of the largest in affording opportunities for improvement.

The speed of saws, knives and cutters, and the feed of machines, are as a rule, in this industry, in a sad condition of unstandardization. Seldom, if ever, are machines run at their maximum capacity. Very often this is due to the poor condition in which the machines are kept; oftener, however, it is due to the attitude prevailing in the plant, namely "I have done it this way for fifty years—I don't see why I should change now." Yet many times a few minor changes in cutter speeds, number of knives on a cutter head and machine feeds have resulted in doubled and tripled output, with very little increase in effort on the part of the operative.

Development of Planning Methods

In its narrowest sense, planning consists of scheduling parts through the necessary operations, machines or departments to enable them to be completed in the shortest possible time to meet the assemblies at the proper time; and to keep machines and operatives always busy. In its broadest scope, however, it involves a great many other factors, such as machine and equipment maintenance; purchasing and stores methods; scheduling and control of factory orders with the proper knowledge of plant capacities, follow-up of orders until shipped, time-keeping and payroll functions, and the collection of direct labor costs.

The case for planning being separated from the execution of work has been so well proved in the past, that it is needless to emphasize it at this time. Planning methods should, in woodworking, be both as simple and effective as possible. Perhaps one of the most effective methods that has so far been developed for planning in this country is the "color cycle" method of control. This can be used for manufacturing either to customers' orders or to stock or both. It has proved in actual practice to be both simple and flexible.

With his method, customers' or stock orders, or both, are grouped into a "cycle color"—composed of one or two weeks output of the factory. Work orders, as issued to the factory, carry the cycle color to which they have been assigned, foremen and men giving preference at all times to any old cycle colors which may still remain in the department, before starting work on the current cycle color. From four to six cycle colors are used, each one or two week period during the year being assigned to a definite color. As each order of parts or assemblies is cleared from a department, it is checked off the departmental order-of-work sheet which also carries the cycle color. The status of any department at any time can be determined by a brief examination of this order-of-work sheet.

Increasing Production and Reducing Costs

An important feature of the development of betterment methods is the selection of the plan of wage payment, which should be based on careful study and analysis. Upon it will depend the possibility of securing satisfied operatives, reduced costs and increased production. The most satisfactory methods of wage payment cover increased production, better quality workmanship, and elimination of waste.

It is not uncommon, through the application of a

*Chief Industrial Engineer, Cooley & Marvin & Co.

carefully prepared wage incentive, to reduce direct labor costs from fifteen to thirty per cent; increased production twenty-five to fifty per cent; increase operatives pay ten to forty per cent; reduce waste (that bug-a-boo of the woodworking industry) ten to twenty-five per cent; and reduce the number of defective parts caused by poor workmanship from ten to thirty per cent.

All operations can be measured by time, and as time is the most important element in manufacture, it is highly desirable that the wage payment should be based on time. In other words, the more nearly the operatives approach the standard time required for an operation, the greater their pay per unit of time should be. Time is a means, also, by which entirely dissimilar operatives, groups, departments or plants can be compared, for the more nearly each unit approaches the standard, the closer to 100% it will be.

Time is also of great value in planning the work through the factory and becomes the means by which the possible capacity of a unit can be determined. The time studies, previously mentioned, are used for the determination of the time standards, or the "rate setting" as it is known. After the rates have been set, it becomes necessary to personally install them, working with the operatives until it has been proved to both management and workers that the rates are just and fair.

It is highly desirable that correct cost methods should be inaugurated concurrently with the development of plant betterment methods. In this way the cost accumulation records may be adapted to the requirements of efficient production, and unnecessary duplication may be avoided.

In order to insure the dependability of the cost figures, it is necessary to provide for proof of their accuracy. This is most satisfactorily accomplished by the introduction of controlling accounts in the general books, and by providing for monthly operating statements, by means of which any general inaccuracies in the costs may be discovered and corrected. In this way it is also possible to prepare a series of financial statements showing currently the condition of the company and the results of its operations from month to month, or oftener, if so desired.

The maximum utility of cost information is obtained by presenting all cost statistics in comparative form. By this means any increase in either the cost of product, or in any of the operating expenses, may be recognized and corrected currently.

(Concluded in May issue)

Is it Profitable to Sell at a Loss?

by Wallace Clark

At what low point in either production or prices does it become unprofitable to continue operations, or,to put it in another way, at what point does the loss from manufacturing drop below that which would be incurred were the plant to be closed down? One large steel industry has found that when production falls below 70% of normal, the manufacturing losses are greater than those due to idleness. .The writer of this article suggests that when orders are scarce, when the work in progress and in view is not sufficient to keep the plant operating at normal productiveness, it is advisable to reduce prices in an effort to bring in more business. He outlines his idea of how far prices may be cut before manufacturing losses exceed those due to a stoppage of active operations.

The man who is responsible for the success or failure of a business is in normal times interested in getting an answer to the question: "How can we increase our profits?" However, when he has few orders in his plant, he is more interested in knowing: "How can we reduce our losses?"

In a period of dull business there are in every manufacturing plant certain expenditures which must go on no matter how few orders there are. The only way to avoid these expenditures is to sell out and in these days that means giving away the plant. If the business is not sold out, it is obvious that the buildings and equipment of every kind must be kept in such condition that they will not deteriorate.

If any work at all is to be done, a skeleton organization must be kept in the shop; that is, the superintendent, the foreman, inspectors, truckmen, watchmen, and so on must be retained. The manager usually tries every other way out before he gives up the nucleus of his working force, because he knows that it will be easier to erect new buildings and buy new machines than to rebuild his organization.

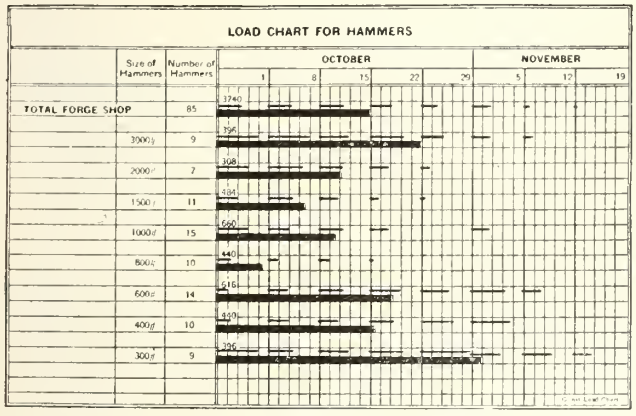
*In March "Factory."

Aim at Reducing Losses

For the sake of simplicity, let us take a one-product plant such as a foundry or, better still a drop forge shop which makes forgings for other companies. The manager has ceased to buy any steel except what is required for actual orders in hand. If he has had sufficient money or credit, he has made the repairs or improvements to his hammers, furnaces, and buildings which he had not had time to do when the shop was full of work. Let us suppose that all this has been done and that he is down to his skeleton organization and has not even enough orders in his plant to keep those men busy. He is loosing a good deal of money each month. What is his next step? How is he going to reduce his losses? The manager has, of course, attempted all along to keep up his sales. He has been unusually careful of the quality of his forgings, has met all delivery promises, has increased his advertising and sent out more salesmen. The only remaining way to increase sales is by a considerable reduction in price. It is natural for him to shrink from this course and before he takes it he wants to know how far he can reduce prices without increasing his losses.

There are certain expenses which must go on if

the shop is kept ready for work: the interest on the investment in land, buildings and equipment, depreciation, taxes, insurance, repairs and the salaries of the skeleton organization. The shop must be provided with light, heat, water and compressed air. All these expenses go on whether there is work or not and they are due to keeping the shop ready for work and are not increased or decreased by the acceptance of an order. It is, therefore, clear that



Helps Manager Visualize Work Ahead

these overhead expenses or losses will not be increased by the acceptance of an order at a price which does not cover any of this overhead.

Must cover Direct Costs

However, the acceptance of an order for forgings will cause certain other expenses. Steel must be bought or drawn from stores: one or more hammer men must be hired; power must be used for the hammers, although this additional expense for power will be small, for insurance regulations usually require that steam be kept up for the operation of fire protection appartus. Fuel must also be used in the forges. These expense are caused by the acceptance of any specific order and the price must, therefore, cover such expenses, that is, the cost of material, direct labor, some power for the hammers, and fuel for the furnaces, for if the price does not cover those out-of-pocket expenses, the acceptance of that order will increase the losses.

Going back to the question: "How far can prices be reduced without increasing losses?" the answer is: "To a point which covers the cost of material, direct labor, power, and fuel, but which does not cover any part of the overhead."

Sell Below Cost Without Increasing Losses

In other words, it is possible to sell below cost without increasing losses. When I speak of selling at this material-labor-power-fuel cost without loss of money, I do not mean to say that that is the real cost of the forgings, for it is not. A portion of the overhead of the department and plant has been used in the production of the forgings and must ,therefore, be charged into their cost. However, we are talking of reducing losses rather than making profits, which, of course, must be based on costs.

Since we have found how low prices can be quoted without increasing losses, the next question is: "What prices should be quoted to reduce losses?"

Knowing that he has nothing to lose until he reaches the material-labor-power-fuel cost the manager begins to lower his quotations and keeps on until he gets the orders. It is not likely that he will have to go as low as the point mentioned. When he does reach the level at which he can secure orders, how long should he continue to quote those prices?

To make this clear, let me tell you how we worked it out in one drop forging plant.

Vary Price According to Value of Orders

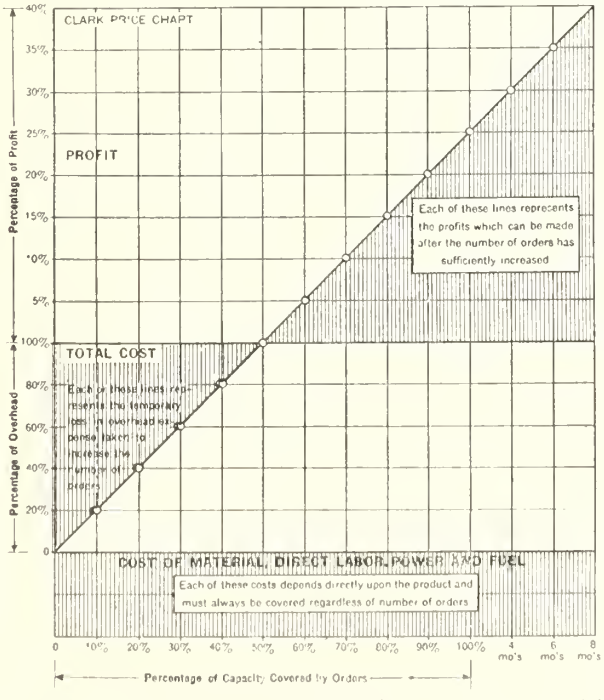
The reason for quoting low prices was the small amount of work in the plant and it was evident that the prices should fluctuate as the work ahead fluctuated. On a Gantt layout chart the work ahead of the hammers was shown. Looking at the second line of this chart, there were nine 3,000-pound hammers in the shop and in a 44-hour week their capacity was 396 hours. They had work assigned to them which would keep them busy 80% of the time as shown by the light line. It was the same the second week, but for the week ending November 12, only 20% of their capacity was taken up. The heavy line showed that the total work ahead of the 3,000-pound hammers would keep them busy for four weeks if it could have been spread over them evenly. The 800-pound hammers, however, had less than one week's work ahead.

The first line of the chart showed the total work ahead of the forge shop. In the first week 50% of the time was taken up, which gradually decreased until there was only 10% in the week of November 19.

This chart was made out at the beginning of each week and showed the work ahead of the plant at that time.

The More Work Ahead the Higher the Price

The lower part of the cost chart shows the cost of material, direct labor, power and fuel. The next line is total cost and above that is profit. Across the bottom of the chart was the percentage of capacity covered by orders, By experiment it was found that



CLARK PRICE CHART
PROFIT
Each of these lines represents the profits which can be made after the number of orders has sufficiently increased
TOTAL COST
COST OF MATERIAL, DIRECT LABOR, POWER AND FUEL
Each of these costs depends directly upon the product and must always be covered regardless of number of orders
Percentage of Profit
Percentage of Overhead
Percentage of Capacity Covered by Orders

Cost Chart Showing How Prices Were Reduced According to Volume of Work Going Through

if the load chart showed 10% of the capacity taken up with orders, prices should be quoted which covered the cost of material, direct labor, power and fuel, and only 20% of the overhead. When 30% of the capacity was taken up, the prices to be quoted should include 60% of the overhead. With 50% of capacity, the prices covered all the overhead, that is, the total

cost. Profits began when the shop was more than half full of work and at 60% of capacity, 5% of profit was quoted. When 100% of capacity was taken up, 25% profit was quoted. When delivery was not wanted for six months or the work ahead prevented the promising of delivery in less than six months, there was greater danger of increases in cost of material and labor and, therefore, 35% profit was quoted.

These two charts were put in the hands of the man who quoted prices and he used them as a guide. This price chart was made for a specific plant and would have to be changed for any other plant. The price line would either be more or less perpendicular than this line. This is an example of working out the Gantt theory of the cost of idleness and applying that theory to the quoting of prices.

When there is plenty of work ahead, prices should be quoted which will produce profits, but when there is little work to be had, prices should be quoted which will reduce losses. Losses must be eliminated before there can be any profits.

Kiln Drying Facts for Busy Executives

Can Shrinkage be Controlled and Eliminated?—If Tendency to Shrink is Resisted what Effect will it Have on Lumber?—Improved Drying Methods and Equipment Offer Chance for Economies

By Wm. Snaith, Associate Engineer, Forests Products Engineering Co., Chicago

The busy factory executive and those to whom the more important functions of plant management have been delegated very often do not have the time, or the inclination, to closely study kiln drying methods and theory. This important subject, which has all the appearance of complexity and does, in fact, call for more than a little technical knowledge, is, however, based on a few broad fundamental principles and it is the purpose of this article to enunciate one of the principal of these which if rightly understood will enable the executive to properly appreciate what can and cannot be accomplished in the drying operation.

I am inspired to write this by some statements I recently saw in a circular which was intended to convey the impression that the shrinkage of lumber could be entirely eliminated by some special method or methods which the author of the circular had conceived. Such statements fly directly in the face of natural physical laws. The particular elementary principle which is violated by these claims is the important fact which can be briefly stated thus,—Lumber can not be expanded in drying, but shrinks nearly in direct proportion to the amount of moisture removed. This statement holds true as long as it is understood that the lumber is not to be injured. Of course it is possible to reduce shrinkage by casehardening and honey-combing, but we do not suppose that the author of the circular intended to advise the production of these ill effects.

Conforms to Fundamental Laws

The physical laws pertaining to the shrinkage of lumber through extraction of moisture are just as surely known as the laws pertaining to contraction and expansion of metal in verying temperatures. The following figures taken from circular 213, issued by the Forest Service branch of the U. S. Department of Agriculture, give the average shrinkage which takes place in different woods when being reduced from green to oven dry condition:

LUMBER SHRINKAGE (per cent) GREEN TO OVEN-DRY.

SPECIES	Regional growth	In total volume	In Radial direction	In tangential direction
Basswood	Penna.	16.5	6.8	9.9
Basswood	Wisc.	14.5	6.2	8.4
Beech	Ind.	16.5	4.6	10.5
Beech	Penna.	15.8	5.1	10.6
Birch, yellow	Wisc.	17.0	7.9	9.0
Birch, yellow	Penna.	16.7	6.9	8.9
Chestnut	Tenn.	12.9	3.4	6.8
Elm, cork	Wisc.	14.1	4.8	8.1
Gum, red		15.0	5.2	9.9
Maple, sugar	Penna.	14.7	4.8	9.2
Maple, sugar	Ind.	14.3	4.9	9.1
Maple, silver	Wisc.	12.0	3.0	7.2
Oak, white swamp	Ind.	17.7	5.5	10.6
Oak, white	La.	16.0	4.8	9.2
Oak, white	Ark.	15.8	6.2	8.3
Oak, red	Tenn.	15.3	3.7	8.3
Oak, white	Ind.	14.3	4.9	9.0
Oak, red	Ind.	13.1	3.7	8.3

In the foregoing table we have shown the various regional growths in the sequence of increased shrinkage in volume of the various species of the same group. For example, Indiana white swamp oak shrinks the greatest amount in volume of any of the other oaks shown. An explanation of the two principal directions of shrinkage, tangential and radial, is given in the accompanying sketches, the third, longitudinal is negligible, as much so as thermal expansion and contraction.

Occurs After Free Moisture has been Removed

It will be noted from the shrinkage table that in the radial direction very few of the species shown, shrink more than 6%, only one being higher than 7%. Furthermore it must be remembered that the percent. of shrinkage shown is the total from green to oven dry. It is a well known fact that oven dry lumber is unfit for commercial use, perhaps as much so as lumber containing too high a moisture content.

Moisture is contained in the tree, both in the actu-

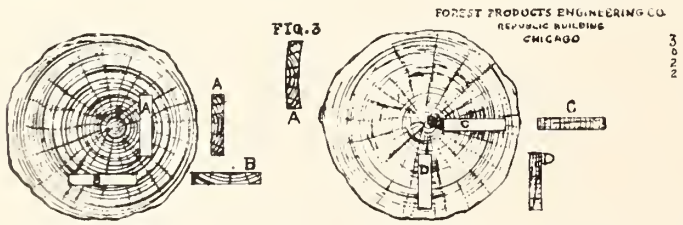


FIG. 1. Two boards, A and B, cut from different sections of the tree altho both are plain sawn. Tangential direction.

FIG. 2. Two boards, C and D, cut from different sections of the tree altho both are quarter sawn. Radial direction

FIG. 3. Indicates how the board A will naturally warp. This can be prevented by proper treatment altho it is physically impossible to prevent shrinkage without serious injury.

Principle Directions in which Shrinkage Takes Place

al fibrous structure and in the open spaces or pores between the fibres. The former is known as "fibre moisture" and the latter as "free moisture."

The total shrinkage from green to oven dry generally takes place after the free moisture has been eliminated and during the process of reducing the fibre moisture. The fibre moisture point is known to be between 25 and 30%, although this does not apply to all species. Some species contain more than 200% (by dry weight of the wood) in their green state. The more common would be around 100% moisture in the green.

For example, any species which contain 100% moisture in the green and which have a known fibre stauration of 25%, could be reduced in moisture either by air drying or kiln drying to the extent of 75% without shrinkage. If the total shrinkage by volume were 10% as may be determined from tables, then this entire amount would shrink in reducing the balance of the moisture.

Since a certain per cent of moisture must be left

Visualizing Your Lumber Requirements

Office Specialty Co., Have Worked out Efficient System—Shows Every Foot in Stock and Where it is—Valuable Assistance to Buyer—Close Check on Slow Moving Stock

By L. R. WRIGHT

"How the 'Office Specialty' Keep Track of Their Lumber" might be a better caption for this article. It is just as necessary to know how much lumber there is in the yard, kiln and dry storage, the quantities of each individual item and how they compare with the probable requirements for the next three or six months, as it is to know how much it costs to produce a given article. More than that there is as little excuse for not keeping lumber records as there is for not maintaining accurat cost records: both are essential to the efficient and profitable operation of a woodworking plant and both enable the management to keep in close touch with the working of the factory.

One would naturally expect that an organization like that of the Office Specialty Mfg. Co., Limited, Newmarket, Ont., specializing largely in office furniture and "efficiency" office systems, would have their own plant so organized and systematized, that all details pertaining to sales, raw material, manufactured stock on hand, stock in process, costs, raw material requirements, etc., would be so tabulated and recorded that such information would be available at a moment's notice. And so they have. With the aid of a few simple forms they are able to practically visualize any phase of their manufacturing activity. This may appear to smack of over-systematization and red tape, but such is not the case. Through a wide division of responsibility, the work of recording and tabulating this information on cards and forms is so simplified and divided that it is done with little or no extra clerical help.

Weekly Lumber Report Compiled

Every week the special lumber report (Fig. 1) is compiled, showing the total quantities of various items in stock, where each lot is to be found and also the minimum and maximum requirements for 1½ and 3 months periods. Then these latter figures are based on requirements for the previous 3 months, and as a result, change from month to month as the total volume of orders increases or decreases. All this data is taken from forms filled out by various department heads.

In order to get a clear grasp of the system in operation, it might be well to start at the beginning. First a lumber record card (Fig. 2) is kept for each item of lumber used. This card gives the total quantity of that particular item in stock, including its dis-

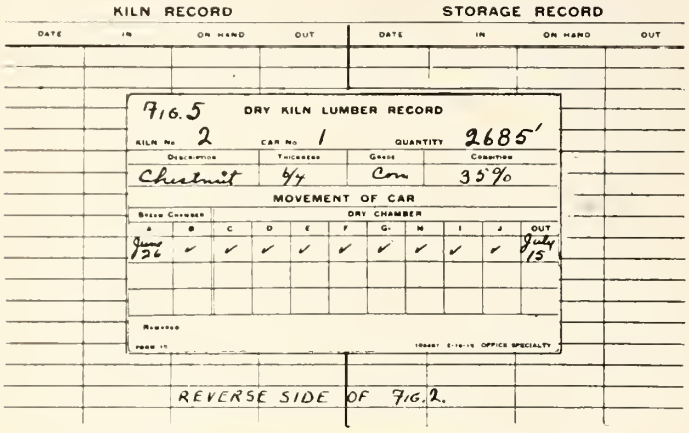
tribution. The information on this card is kept up to date by entering daily all lumber received and all lumber delivered to kiln, dry storage and factory.

When a car of lumber is received, unloaded, inspected and accepted, the "original lumber report" (Fig. 3) is made out by the yard foreman and turned in. This gives full particulars regarding the various items in the car and forms the basis for the entries on the "lumber record card." As different lots of lumber are placed in the kiln and from there to dry storage, a special report (Fig. 4) is made out, also by the



Reverse Side of "Lumber Report" and "Dry Kiln Record"

yard foreman, covering the movement of lumber from yard to kiln and from kiln to dry storave.

Each Foreman Held Responsible

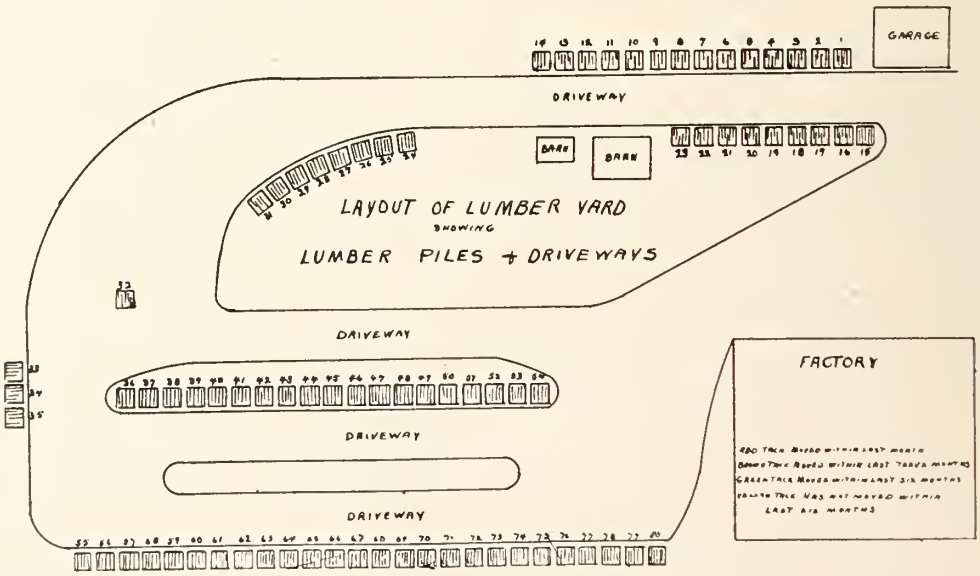
The lumber has now passed from the control of the yard foreman into the hands of the man in charge of the dry storage. This latter employee assumes full responsibility and issues the stock as required to the factory upon the presentation of a signed requisition (Fig. 5) which gives full particulars of the items required and the order number of the job for which the material is intended. After the requisition has been filled, it is passed to the man in charge of the lumber record card, who enters the amounts as delivered to factory. In order to conserve space and simplify the storing of the dry lumber, the different widths are not piled separately but are sorted as to multiples, that is 3 inches and multiples of 3 in one pile, 4 and multiples of 4 in another, and so on. This makes it easy to select stock to rip to certain widths.

The waste is calculated each month and is figured on the basis of the net requirements of the orders going through the plant and the amount of lumber brought in from dry storage on requisitions. It varies for different stocks and different articles but average in the neighborhood of 45%.

Progress of Lumber Through Kiln

In addition to the forms mentioned, a kiln lumber record (Fig. 5) is used. This serves to show how the lumber in the kiln is progressing. The kilns, which are the Grand Rapids progressive type, are long enough to hold ten cars. The dry kiln lumber record is divided into ten spaces to correspond to the car spaces in the kiln. When a car of lumber is entered in the kiln, the particulars are recorded on one of these cards and the date entered under A, which corresponds to the first cas in the kiln. As it is moved from space to space, a tick is made in the proper place on the card to indicate just how far that particular car has been moved. These cards are kept in the superintendent's office so that he is able to tell at a glance just how far along any particular car is and how soon it is likely to be ready to be taken out of the kiln. The date on which the car is taken from the kiln is also recorded which gives a check on the length of the drying period. The entry made under the heading "Condition," indicates the relative humidity in the wet end of the kiln at the time the car was moved ahead from the steaming chamber.

The dry storage is a bright airy place in which the lumber is kept under ideal conditions. It is plentifully supplied with heating pipes and the temperature is held the same as in the factory proper. As the loaded kiln trucks come into the dry storage, they are allowed to stand for from 24 to 48 hours to temper before being unloaded. As the stock in dry storage is kept under practically the same conditions as



Layout of Lumber Yard on which Colored Pine are used to Indicate Movement of Stock

re found in the factory proper, if the material has been properly dried there is no likelihood of any trouble being exprienced from warping or checking.

How Lumber Yard is Systimatized

The lumber yard is laid out as shown in the accompanying sketch. Each pile bottom is numbered to correspond with the numbers on the chart a square metal plate 3 x 3 inches, being used to indicate the number of the pile. An index is kept in connection with this chart showing the kind and size of lumber in each pile. This is changed from time to time as lumber is received or delivered to the kiln or factory. A check is kept on the lumber turn-over by using different colored tacks to indicate how long each pile has been standing untouched in the yard; for example, a red tack on a certain pile shows that it has been moved within the last month; a brown tack within the last three months; a green tack within the last six months, while a yellow tack shows that the pile has not been moved for over six months. As it is their policy to maintain a three-months' supply in stock, when it is noticed that a certain pile has been in the yard for six months or longer, the cause for this slowness of movement is investigated. It may be that the stock does not come up to grade or is not of a suitable size, etc., etc. When this is once ascertained, steps are taken to see that it is worked up to the best advantage.

This may seem like a very complicated system, requiring considerable clerical help, but when the fact that each foreman in charge is responsible for only one or two forms, it will be realized that such a system can be maintained with a minimum of effort and cost.

Are Woodworkers Inclined to Figure Low?

Majority of Estimates Submitted This Month Below Figures Kept on Job—Does This Mean That Tendency is to Figure as Low as Possible Rather Than Play Safe?—Variation in Material Excessive

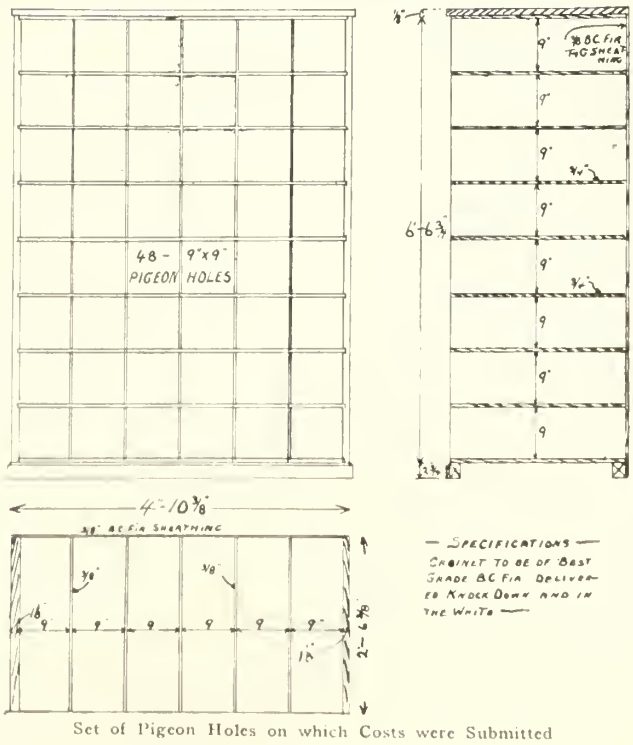
These cost articles would be more interesting and more instructive if those who co-operate would suggest how the cost could be kept as low as possible. Doubtless there are many ideas which could be applied, which would either result in a saving in material or a saving in labor. For instance, one woodworker, in submitting his estimate, has this to say,—"In practice this set of pigeon holes would, probably, cost less than we estimated, as we would glue up the upright divisions from 1-inch lumber resaw to ½-inch and dress to 3/8 inch then trim to 9¼ inches. This, to my mind, would be the correct way if one had a resaw, planer and sander that would take material 30 inches wide, but such equipment is not found in all plants. I hope my estimate is close and that I will be able to come in again in the future." (His estimate was $64.85.) This is a real suggestion and indicates how both material and labor costs may be lowered.

List of Estimates Submitted

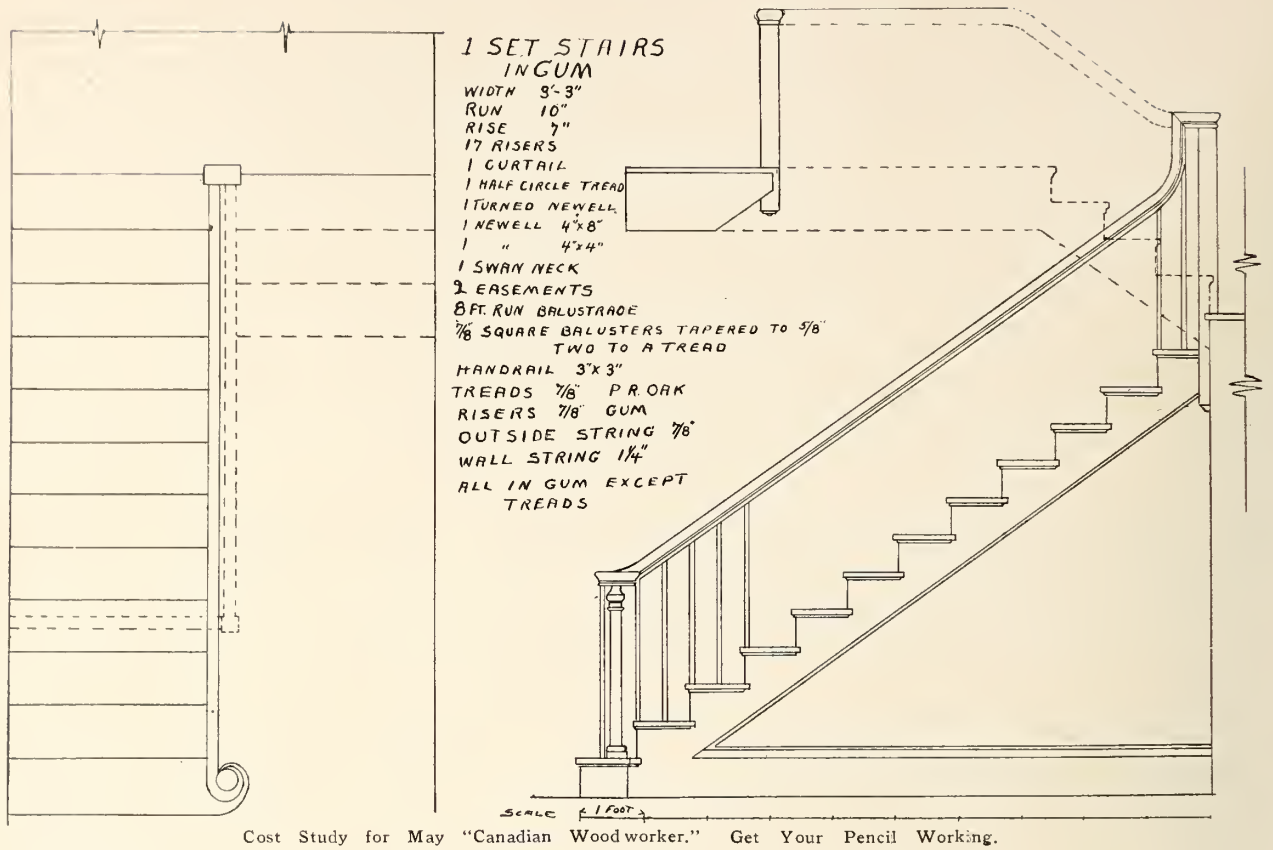
No.	Material feet	Waste	Bench	Hour rate	Machine hours	Hour rate	C. Burden %	Total
1	285	20	2	$ .85	8	$1.50	20	$51.01
2	247	15	10	.85	7	1.10	20	51.33
3	268	10	12	.70	14	1.25	20	58.40
4	308	20	15	.90	6	1.20	20	60.66
5	340	20	8	.75	15	1.50	15	64.38
6	301	25	11	.90	9	1.25	15	64.85
7	285	15	6	.95	5	1.30	20	66.25
8	315	15	5	.80	9	1.00	15	70.27
9	**304**	**25**	**14**	**.90**	**15**	**1.20**	**20**	**75.80**
10	264	15	9	1.00	12	1.25	20	79.08
11	310	15	7	.65	14	1.50	15	83.00
12	241	20	12	.75	10	1.35	20	87.65
13	295	10	7	.70	9	1.40	20	89.15
14	286	25	16	.80	13	1.30	15	91.20

A glance at the list of estimates submitted this month show that the majority of the figures sent in are below the actual costs as submitted by the party who filled the order. It is possible that his figures are higher than the average or above what they should be. This brings out another point. Why not make a prictice of criticizing, constructively of course, anything with which you do not agree. If you think certain figures are too low or too high, do not hesitate to say so and give figures and facts to back up your opinion. In this way we will get much further with our cost studies and gain more from the data published than if everything is accepted as gospel truth. Such constructive critisisms need not be confined to the cost articles alone but could apply to anything published in any issue of the "Canadian Woodworker."

The surveys of material do not show as great a variation as in some of the other studies though the difference between high and low, 241 feet and 340 feet, is 40%. This is far too great. The amount of material required to make any article should not show a difference of more than 5 to 10% when figured in different shops. This is particularly true in connection with these cost estimates as the quantities are



Set of Pigeon Holes on which Costs were Submitted



Cost Study for May "Canadian Woodworker." Get Your Pencil Working.

net, with the waste allowance to be added. Strictly speaking, the net feetage of any job should figure the same, no matter where or how calculated.

Coming to the waste column, the most noticeable feature is the number who have allowed 15% and under. Five estimate 15% and two make an allowance of 10%. These figures are undoubtedly too low. An accurate check on all material used would show that the waste seldom runs below 20% and from that up. As a matter of protection it would appear to be the part of wisdom to always figure at least 20% waste. This may seem a small item but often it means a difference between profit and loss.

Material	Details of actual cost	
259 ft. Fir @ $90.	$23.30	
40 " ⅜ Sheathing, Pine @ $60.	2.40	
5 " Common Pine @ $75.	.35	
	26.05	
Waste 25 %	6.51	$32.56
Labor		
Machine, 15 hours @ $1.20	$18.00	
Bench 14 " @ .90	12.60	$30.60
		$63.16
20 % Commercial Burden		12.64
		$75.80

The rates per hour for bench and machine labor are included this month. These figures are not the actual amounts paid but cover an allowance for factory overhead. The firms figuring 65 cents per hr. for bench labor and $1.00 per hour for machine labor either do not pay their employees any too generously or they do not allow very much for overhead. This latter allowance should include such expenses as supervision, indirect labor, power, heat, light, insurance, taxes, interest, depreciation, supplies, repair and other items of a similar nature. The Millwork Cost Bureau of Chicago, have found that the average machine burden based on figures taken from 500 plants is 57 cents per hr. and the bench burden 34 cents per hr. Take 34 cents from 65 cents and it looks like a wage of 30 cents an hour for skilled cabinet makers.

The commercial burden column shows a few 15% allowances. Commercial burden is used to separate administrative, management, sales and service expenses from those directly chargeable to the factory operation. The items included under this heading are office expenses, selling and advertising costs, salary of manager and office staff, delivery costs and similar expenses. The main reasons for separating these items are to keep track of the cost of doing business so as to be able to compare it with the total value of the output of the factory and also to determine whether or not it is more profitable to manufacture certain stock items or to buy them on the open market. If the prevailing prices were below the manufacturing cost without the addition of the commercial burden, the items in question could be purchased and handled to better advantage than if they were made in the plant.

The total costs seem to run in groups this month. Two estimate in the vicinity of $51.00, three run near $65.00 and three are around the $88.00 mark. As the general average is below No. 9, the actual cost, it raises a doubt as to whether or not this is too high. The variation is out of all reason as usual.

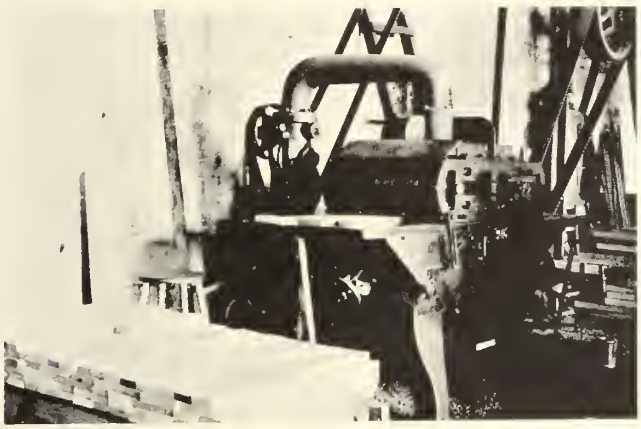
The subject selected for next month is a set of stairs. This is a real test and should bring out a record number of estimates. It affords Canadian members of the Millwork Cost Bureau an opportunity to work in their application of Cost Book "A" and compare the results with the ideas of stair costs held by non members. If everyone co-operates the cost studies in the May issue will be an outstanding feature, and by including practical suggestions and a discussion of details and methods, it will contain much information of real practical value. Will you do your part?

Two Boys do the Work of Four Men

Reduced Labor Costs and Increased Production With Labor-Saving Equipment— Self-Feed Jointer Working Economies in Many Plants— Greater Safety Secured

The jointer or buzz planer is one of the most versatile machines to be found in a woodworking plant. In skilled hands it can be used for a wide variety of operations, such as jointing, straightening, rabbeting, beading and running simple moulds. Like other machines, it is not perfect but has its drawbacks, disadvantages and limitations, two of which are low productiveness and danger to operator.

That this is not a production machine was fully demonstrated when it came to straightening and facing large quantities of either wide or narrow stock. If you keep a man shoving work over the cutters all



Feed Attachment on Jointer in Hanover Plant

day long, and not only will the job become very tedious but the amount of stock put through in a day's run will not be any too satisfactory. If the quantity of material to be straightened each day is very large, three or four buzz planers may be required, requiring an equal number of operators and a considerable amount of floor space. It was just to overcome this condition that the power feed jointer or under-cut planer was placed on the market.

Higher Production Secured

The development of the power feed jointer has proceeded along two lines,—one the perfecting of feeding attachments which may be used in the ordinary type of buzz planers, the other the perfecting of special power feed jointers or straighteners. In both of these types of equipment, safety to operator and high productiveness are outstanding features.

In the first class, power feed attachments, special feed works are carried on a separate column or on an arm attached to the base of the machine. This attachment is so designed that it may be swung clear of the jointer when other forms of work are being handled or when knives are being sharpened or ground. This really makes a combination power feed jointer and buzz planer. The feed works are so constructed that they can be readily raised or lowered to accommodate material of different thicknesses.

The special self-feed jointer or, as it is sometimes called, the under-cut planer, is designed primarily for production work on straightening and facing wide and narrow stock. The feed works, which practically cover the full surface of the two beds, are supported on four columns. In this way the feed mechanism is always in perfect alignment with the bed of the machine. It is usually constructed to take care of the variation in the thickness of stock going through and will handle a difference of $\frac{3}{4}$ inches without changing three or four hand feed machines and as no particu- the set. As far as output is concerned, it is equal to lar skill is required and as practically all danger is eliminated, may be operated by two boys, effecting a desirable saving in labor costs.

A number of Canadian woodworkers were approached with a view to ascertaining their experiences with this machine. The replies received were, to say the least, enlightening. One well-known panel manufacturer writes,—"The round cylinder head with high speed knives, together with the self-feed attachment, allows the operator to keep the machine full to capacity at all times. The feed adjusts itself to the thickness of the board so that boards varying in thickness

Self Feed Jointer in Plant of Chesley Furniture Co., Chesley, Ont.

as much as $\frac{1}{4}$ or $\frac{1}{2}$ inch may be put through at the same time. The adjustments are so simple that an inexperienced man can learn to operate the machine in an hour. There is no question but that production is increased and cost cut down. A man and a boy can do as much in eight hours as one man could do in sixty hours on the ordinary buzz planer."

A furniture manufacturer has this to say,—"We are very well satisfied with the performance of our under-cut planer. Its output is equal to four ordinary buzz planers and does not require a highly skilled

operator, while the quality of the work is all that could be desired. We find it entirely eliminates buzz planer accidents, and have come to the conclusion that in the manufacture of furniture this machine is an absolute necessity.

Another manufacturer, specializing in store fixtures, replied as follows:—"I may say that previous to installing this machine I had no end of trouble with work piling up and seemingly could not get it past the buzz planer fast enough to keep the rest of the department going. After I put in an under-cut planer this difficulty was overcome, so much so that I am using one man less in this department with much better results."

Other Economies Effected

While both the special under-cut planer itself and a buzz planer, equipped with feed attachment, are capable of turning out a large volume of straightened work in a day's run, yet it goes without saying that the special self-feed jointer will handle more and heavier work than a buzz planer equipped with feeding attachment, but either type of machine will turn out as much work as from two to five hand-fed machines. This means that two savings are made, one with regard to labor, as two men or two boys will do as much work as from three to five men under ordinary conditions, and in addition there is the saving in space. In the larger plants the self-feed jointer has not entirely replaced buzz planers as usually one or two are retained for handling edge work and for special detail jobs.

An idea of productiveness with this equipment may be gained from the fact that feed rates from 25 to 40 feet a minute may be carried and that the full width of the machine may be utilized all the time.

How Can We Operate Profitably?

Laidlaw Lumber Co., Find That Frequent Meetings of Staff and Key-Men Improves Team Work—Many Practical Ideas Brought Out—Minutes of Meeting Showing Range of Subjects Covered

Woodworking plants are to-day confronted with the problem of "How can we operate profitably?"

Efficiency will give us all the advantages obtainable, but to be in possession of efficiency, we must be thoroughly organized. To obtain the desired results, we must have loyal co-operation, and the latter can only be developed by open and frank discussion of the many problems arising from day to day. By this expedient, perfect team work accrues, friction is reduced to a minimum, order is brought out of chaos and loss turned to profit.

To bring out and develop this team work or uniformity of action, different firms resort to various methods; some by way of suggestions sent in from time to time; others by bulletins or house organs, whilst others have periodical meetings of all the executive or keymen and frankly discuss the many problems arising. The latter method appeals to me as the most practical, and is the one used by my own firm. It commends itself in many ways.

It is possible for a body of men to work together day by day for many years and yet be comparative strangers, but meeting together at short intervals to discuss frankly every-day problems, will break down any barrier, create comradeship and generally inspire an atmosphere of co-operation and confidence.

No one man possesses a monopoly of ideas. We find that, by meeting together in this way and exchanging views, we can pool our different ideas, adopting those of merit, and rejecting the others. The result is obvious and the effect can be seen in every operation. We have elevated these men from merely order takers or operators to a position where they take a vital interest in our production and other problems, and it is, indeed, surprising the splendid suggestions that accrue from the most unexpected sources.

Hold Executive Meetings Monthly

We hold what is known as a general executive meeting every four weeks. This embraces the whole of our Toronto organization. Then, intermediately, we hold a local executive, so that we have a session of some kind every two weeks. At the former, we discuss things of general interest, such as trade conditions, quotations, credits, in fact we take a wide range endeavoring to cover in a general way all matters of vital interest. At our local meetings, we try to confine our thoughts to such problems as may occur within our range of operations, more especially those within our own plant.

The results are gratifying and are briefly as follows:—The speeding up of production; general co-operation; the movement of slow-moving stock; creating an atmosphere of loyalty, etc.

I append samples of minutes, extracted from our minute book, which will be more eloquent than any explanation.

Minutes of previous meeting read, accepted and signed.

Advertising being the subject discussed at the previous meeting, the chairman called for further discussions on this point. The previous minutes were finally analyzed and it was decided that each member seriously consider the matter.

Harris, that Mr. Shillinglaw gather up the information

Moved by Mr. E. Griffiths, seconded by Mr. F. re garage buildings—Carried.

Moved by Mr. McDowell, seconded by Mr. Shillinglaw, that each person submit a suggestion on advertising—Carried.

The chairman again called the committee's attention to production. He referred to a letter sent out by him to the men on this subject, and further emphasized the vital importance of this matter. He also intimated that he intended calling the men of the plant together and giving them a talk on the topic.

The agenda was then taken up and the first point as to congestion was discussed.

It was admitted such congestion existed, that the 12-inch sticker and jointer were in such positions as to cause delays in setting up and production and also a trap for accidents. This matter was promised con-

sideration by the chairman, and prompt attention where possible would be taken.

Moved by Mr. Griffiths, seconded by Mr. Chamberlain, that the jointer be removed to a position named at a later date—Carried.

Moved by Mr. Chamberlain, seconded by Mr. McDowell, that the power feed saw jointer and 8-inch sticker at the old plant be investigated as to their being suitable for the mill—Carried.

Moved by Mr. McDowell, seconded by Mr. Blacklock, that an explanation regarding the capacity of the mill by the manager be accepted—Carried.

Moved by Mr. Chamberlain, seconded by Mr. McDowell, that a millman use duplicate order blanks for his requirements, and that said orders be immediately acted upon by the manager—Carried.

Moved by Mr. Griffiths, seconded by Mr. F. Harris, that the pony planer for the mill be investigated immediately and considered at the next meeting—Carried.

Moved by Mr. McDowell, seconded by Mr. Blacklock, that the mill windows be cleaned and that the millmen report regarding illumination in the mill and place the same on the order blank—Carried.

Moved by Mr. McDowell, seconded by Mr. Chamberlain, that information regarding the cost of putting work through the mill, be available to millmen at the end of each month—Carried.

Moved by Mr. McDowell, seconded by Mr. Shillinglaw, that the east yard and the west factory complete the agenda for the next meeting, Thursay April 7th, 1922—Carried.

Composition of the Executive

An executive should consist of the following men; manager, superintendent, foreman, shipper, office staff and other leading or keymen.

The only officers necessary are the chairman and secretary, but that the work of the executive may be effective, these officers must perform their duties faithfully, because business once discussed and passed, unless properly recorded and executed, is useless.

A good rule to adopt is, at given periods, to have a re-capitulation of all business done and thereby see if the recommendations have been carried out and the anticipated benefit derived.

Our executive has been in existence nearly three years, and I have been frequently asked "does the interest waver?" My reply is that enthusiasm has never run so high as at present. At each meeting, we discuss some new question with our men. The logical way in which our problems are reviewed and disposed of is a revelation.

The executive has amongst other things formed a fire squad under the leadership of our factory superintendent. The squad being made up of hand-picked men, it necessarily gives us a fine body of fire guardians.

We also have a vigilance committee to prevent accidents. It is the duty of these men to warn careless employees of the danger of certain operations, and if any accident does occur, to see that it is properly attended to by a doctor; and during the stages of convalescence, to visit any injured employee, making sure that he is receiving proper care; and that he himself is doing all that is possible to bring about a speedy recovery. These are a few of the things that we discuss.

We place special emphasis on the elimination of waste in all its different phases, and the way our men endeavor to use up every vestige of material is gratifying.

Another live question is that of production,—trying to devise ways and means of speeding up, and it is surprising the time that can be saved when the whole staff operate as a unit. This is co-operation.

Closer Attention to Fine Circular Saws

Satisfactory Results Demand Well Fitted Saws—Have You Provided Well Equipped Filing Room—Many Dollars Wasted Through Careless, Inefficient Filing Methods

By H. A. RALPHE

I had the opportunity to go through a furniture factory a short time ago, and while it seemed to have the very best machinery for the work it was doing, I regret to say that I found the filing room in connection with the engine and boiler room, and one man was engineer, fireman and trying to be the filer. I wonder how many extra five-inch resaws and scroll saws that company has purchased since it started operations five years ago. By the looks of the broken saws it certainly must be a large number.

The location of the filing room should be as readily accessible to the different wood-working departments of the mill as possible. The features of ample size, abundant light, heating, and also ventilation, cannot be profitably ignored, but it is in these respects that the majority of wood-working plants are extremely lacking. These defects work positive loss in time, and the practical fitting of the saws, and I believe every hundred dollars spent intelligently in the construction of a filing room and its equipment will yield a larger per cent of profit on the investment than double such expenditure in any other department of the plant.

The saw stretcher and anvil bench where band resaws and circular saws are hammered and tensioned should have a north light, with no side lights that will interfere with the filer's tests of the saw with tension gauge or straight edge. In a good many sawmills the use of skylights for admission of light on sharpening and grinding machinery proves both satisfactory and desirable, and why shouldn't it be just as essential in the wood working establishments where the saws, as a rule, are of much finer nature? Spring set and hand filing have no more place in a factory than in a sawmill, except on such saws as are used for crosscutting, or which form the fine character of the teeth and cannot be swaged successfully.

A full swaged tooth is the only tooth to run on any kind of a rip saw. A well-rounded saw, with teeth swaged and properly side dressed, and with proper

pitch and clearance for the dust, is a combination unsurpassed. Any kind of a round saw, such as edgers, bolters, lath and shingle, barrel stave and veneer saws, solid and segment rip and resaws, run with a swaged tooth, will do more and much better work than if fitted by hand with spring set. It may be claimed that the hand filing and setting are simpler and require less skill on the part of the filer than the use of an emery-sharpening machine and a saw swage, and this is true to a certain extent, but no one will argue that there is a profit in crude, inferior saw fitting, or that the factory saw filers are not disposed to progress and improve the character of their work. If a higher grade of work is demanded, there will be found men to meet the advanced requirements, and a man of fair ability can do so if given the proper tools to work with.

A few factory operatives have considered that any kind of a roustabout could fit their saws well enough, and really consider a cheap man and a file to be a complete filing room outfit. Some have furnished an upset, swaging hammer, a bench grinder, and a T-rail for an anvil, and some still more progressive, and quicker to see the advantage arising from the use of finely fitted saws have furnished rooms of proper size, well lighted and equipped with sharpener, swage, hammering outfit, knife grinder, and other tools necessary and adapted to the various requirements. A good saw fitting equipment well-suited to general wood-working plants may be obtained for a reasonable outlay, and it will save its cost several times a year over inferior tools or an absence of tools.

Dull saws and rounded corners cost the operator a good deal more money than a well paid, competent filer. To put a cheap man into the filing room is one way to lose money. Again, cheap tools and machinery are not good, and good tools and machinery are not cheap. It not infrequently happens that as between two machines for filing room service and also for wood-working purposes, the price for one may be from 50 per cent to 100 per cent higher than the other. You may rest assured that in almost every instance you get just what you pay for.

Filer Should Specialize

It is doubtful whether the policy practiced in some mills and factories of making the filer a general utility man, liable to interruptions and calls upon his time for duties entirely outside his regular work, is a good one. Thus in some factories the filer is expected to keep up a lot of machines, keep up an engine or two, take care of a lot of belting, do filing on saws that require the very finest and most skilful treatment, and do all this perhaps with an outfit of odds and ends, when, in fact it couldn't be done with the very best of filing machinery. Certainly it is a fact that a factory filer who is thoroughly competent deserves as much pay as he generally gets.

Keep your saws jointed so every tooth touches the jointer, and you will have a round saw with each tooth performing its portion of the cutting. Understand that fine work from any kind of a saw depends mainly on the fitting and the way it is benched. Maintain teeth not too long nor too short, but according to the work being done---also round, and nice round throats. The stock should be fed to any saw so that the teeth will take a deep, full cut rather than a light scraping one, as they will stand up to the work with less tendency to dull. I have often observed in sawing dry hardwoods that the saw is dulled in a short time, and this can easily be traced to improper feeding.

There are conditions of excellence that must exist in the machines on which saws are to run always requisite to the successful operation of the saw, however well fitted, and it is presupposed that every saw arbor is level, and in line with the table or carriage, and runs without end play, or lost motion in the boxes, and especially that the mandrel hole in the saw fits the arbor, and arbors run cool, etc., otherwise the best fitted saws will not be able to do good work.

How to Reduce Freight Costs

The movement on foot to promote the more general use of ready-cut small dimension stock is gaining momentum. Increased interest in this problem of such vital importance to all manufacturers and consumers of the raw forest material is being exemplified by numerous progressive firms among all the various wood-using industries. As a fundamental step the U. S. Forest Service, through its Forest Products Laboratory, Madison, Wisconsin, has been gathering first hand detailed information during the past eight months on the waste occurring in the production of dimension stock at woodworking plants, together with actual costs of such production.

It is, of course, quite generally known that in present practice a majority of the wood-using industries are required to purchase their raw material in the form of previously manufactured lumber. After bearing the excessive cost for freight on the material from the lumber manufacturing centres, the consumers must recut this lumber, not necessarily manufactured in sizes or shapes at all suitable for their particular purposes, into the small stock required in the fabrication of their wood products. Thus, the manufacturers must not only pay for the additional cost in cutting the required clear stock from this lumber and pay a lumber rate on the defective material not suitable for the small stock, but also must pay excessive freight charges on the defective material which is disposed of as waste. It is obvious then, that in best practice this small stock required by the chair and other secondary wood-using industries should be manufactured

Taxes and Capital

Opponents of capital must learn that enactment of a high progressive surtax in the income tax law was like the victory of Pyrrhus. Beginning at $5000, the rate increases until it becomes confiscatory for large incomes. If a man invests in a productive enterprise and receives an income of $500,000, the government takes $303,190 of it. If he earns $1,000,000, he can retain only $336,810. Should he earn $2,000,000, the government would take $1,393,000, and leave him $608,-100. Courts hold that capital is entitled to a fair return. For two seasons the Soviet took the peasants' grain from them, and at the third season they refused to plant except for their own needs. Now, Russia is starving. Take away the incentive of a return and capital will not be risked in industrial enterprise. That is why new promotions are falling off so rapidly. Capital is industry's life blood, but the surtax is a halter around its neck to strangle it.---Barron's Weekly.

Differential Price List for Boxes and Shooks

The Millwork Industry has in Cost Book A of the Millwork Cost Bureau a Basic Price List for Made to Order Millwork—Would Basic Price List Assist Box Manufacturers in Quoting on their Product?—Subject for Discussion at Annual Meeting of National Association of Box Manufacturers

By H. L. Pease, Secretary

Many products used in the course of manufacturing boxes and shooks are purchased by the box manufacturer on a percentage of a list price, as belting, nails, wire and steel goods. The price to the buyer varies as the discount of the list varies. In the wood box industry, the general price quotation is on either a per-box unit or a per-M-feet unit. A base price method from which various discounts are taken, has been successfully used by a small group of box manufacturers.

Benefits Which Would Accrue

While the Differential Price List should not be confused with a Cost Accounting System, it would in reality materially assits factories that do not know the cost of producing various boxes. A factory that can sell a textile case or a canned food box for a certain figure, and these we might term their "pet" boxes would after years of experience know at what price either of the boxes referred to could be sold and net a certain profit. It is safe to say that every box manufacturer has some "pet" box he makes and taking experience of a period of time, knows what price to charge in order to make a 10, 15 or 20% profit. The same manufacturer receiving an order for say, 100 boxes of different dimensions would not know unless he had accurate Cost System, the price to charge to receive approximately the same percentage of profit as was being made on the "pet" box. Such a factory could use the Differential Price List, figure the discount on his "pet" box that would net him the desired profit and by applying the same discount to all other orders, receive approximately the same percentage of profit.

Possibly the reason why such a price list has not been given wider application is principally on account of the differences in materials used in various districts. The wood box industry is working with a varying commodity and for that reason it might at first appear to be somewhat difficult to arrive at a base price upon which discounts would be applied to meet the conditions in various factories and districts.

Small and Large Boxes Cost More

The theory of the base price list, known as the Differential Price List, is that it costs more to manufacture a small box than it does one of the average size, and that when the size of the container is increased beyond a certain point the production cost rises. The Differential List was compiled from the experience of a number of factories, and the figures were compiled from a curve, the start of which first represented costs of the smaller boxes, the curve slanting downwards representing lower costs in the manufacture of ordinary-size cases. After passing that point it gradually had an upward trend, showing the cost of the unusually large boxes. A manufacturer using the list would have to determine his individual discount and the discount would vary according to the kind of lumber used and would vary with each manufacturer. This on account of the differences in production costs in different factories. To illustrate, on account of this difference in lumber price, it would be necessary to have a different discount to apply to White Pine from that which would apply to Hemlock. It would be necessary to have a different discount for hardwoods from that which would apply to softwoods. It might be necessary to have a different discount for all 13/16 from that which would apply to a resawed box, as there is usually a spread between the selling price of all 13/16 boxes and re-sawed boxes.

The use of the Differential Price List will bring to the seller's mind the various extras which so frequently go into a box, printing, corrugated fasteners, cleating, quantity orders, selected stock and other details enumerated in this paper. The correct application of the price list will assure the manufacturer that he is paid for all of these extras.

Simplifies Price Making

Many factories will to-day quote a price on the per-M-feet basis, regardless of size or thickness. It is true that the application of the price list will mean that each individual box be given consideration and its feetage determined, but can a man devote time to better advantage, inasmuch as it would mean a more accurate knowledge of cost and profit to the manufacturer?

By re-arranging the card index record of customers' boxes and by showing on each card the list price of the box or shook, it would mean that when the index is finally established it would never be necessary to again refigure the sizes, for the list price never changes. In the future, after such change had been made and a request would come for the price on a certain box, assuming that a card for that box is in the file, it would only be necessary to apply the manufacturer's discount which he happened to be using at that time to that price in making quotation, and by applying that discount, the manufacturer would know, without any question or doubt, that, he was making approximately the profit he figured.

In looking ahead in our Association activities, it may be possible that sometime we shall be able to establish a Uniform Sales Report which would apply quite generally throughout the country. Such a report would to-day be of little use in that the information collected and disseminated would necessarily have to be based upon the per-M-feet basis, which as every manufacturer knows, is somewhat misleading, for a quotation of $50.00 per-M-feet might seem somewhat higher or net a larger profit than a quotation of $45.00 per-M-feet, while in reality there may be so many extras on the $50.00 price that the profit to the manufacturer selling the $45.00 order would be greater than that of the $50.00 order. The use of the Differential Price List in the Compiling of statistical matter would eliminate that difficulty, for it would make no difference as to the extras, for two men might sell at 40% of the list and when the figures

were reduced to board measure one might receive $45.00 and the other $50.00, the various extras enumerated in this accounting for the higher price.

There probably has never been so simple or so accurate a system devised for the quotation of shook prices, for once the card index is developed anyone in the office from the office boy up, who can multiply one figure by another, can quote a price, for it is but necessary that the one in charge of price quotations in each plant fix the discount for his plant and anyone can apply that discount to any box, and the manager will know that the price nets a certain profit.

How to Secure List Price

Find the surface measure for each pair of parts: viz., two sides; top and bottom; ends and cleats (if any). Use the Official Box Estimator adopted by the National Association of Box Manufacturers. After securing the surface measure for each pair of parts refer to the Differential Price List, placing on figuring sheet the list price for each pair of parts.

Rules for Disposition of Fractions

Feetage fractions of less than .024, omit.
Fractions of .25 or greater, but less than .75 stoti. as .5.
Fractions of .75 or greater, increase to the next whole number.
Illustration:

3.823 feet treat as 3.80 feet
6.367 feet treat as 6.35 feet
7.081 feet treat as 7.10 feet

Ascertaining the List Price

Size 30" x 18" x 16½"
Style 1 13/16"

Cutting Size		S. M.	List Price
Sides	31-5/8" x 16-1/2"	7.247	$47.39
Top & Bottom	31-5/8" x 19-5/8"	8.709	56.24
Ends	18" x 16-1/2"	4.125	27.77
		20.081	$131.40
3% of list for bundling			3.94
List Price per 100 boxes			135.34

To Ascertain Discount to Apply to List Price

We will assume that the foregoing box is the "pet box" referred to in the introduction and that with lumber, labor, overhead and supplies costing a certain figure the box manufacturer knows he can sell it on the basis of $41.75 per M ft. and make 10% profit. In arriving at a discount the BOARD MEASURE is used instead of surface measure. In the example on account of the box being constructed of 13/16" material, the board and surface measure is the same. (The total, 20.081 ft. can be termed as board or surface measure.)

Divide the list price by the feetage (board measure) gives price per M ft. list.

$135.34 divided by 20.08 ft. is $67.40, List price per M ft.

To arrive at the discount of the list that will give approximately $41.75 per M, divide the selling price ($41.75) by the list price per M ft. ($67.40.)

$41.75 divided by $67.40 = 62%.

The percentage of list to give approximately $41.75 per M ft. (board measure) is 62%.

By applying that discount to all other boxes regardless of size,style or extra operations the profit will be approximately the same and it is not necessary to change the discount until there has been a change in costs.

Discount Applied to Resawed Box

The cost of manufacturing a resawed box is somewhat greater than the cost of manufacturing one of 13/16". It also costs more to manufacture a style 4 than it does a style 1.

Resawed Box Example

Size 30" x 18" x 16½" Style 4,
13/16" Ends and Cleats, cleats 3"
Sides, Top and Bottom 3/8"

Cutting Size		S. M.	List Price
Sides	33-1/4" x 16-1/2"	7.620	$25.18
Top & Bottom	31-5/8" x 18-3/4"	8.236	27.19
Ends	18" x 16-1/2"	4.125	27.77
Cleats (see note)	17-1/4" x 6"	1.438	10.06
Cleating (nailing charge)			1.80
			$92.00
3% of list for bundling			2.76
List Price			$94.76

Nate: In the illustration (a style 4 box) there are two cleats on each end, each 17-1/4" x 3" or four cleats on the box. In the interest of simplicity in using the Differential List the two cleats on each end are considered as one piece 17-1/4" x 6".

62%of $94.67 = $58.70 per 100 boxes, Selling Price
Board measure in above example 13.49 ft.
$50.70 divided by 13.49 ft. = $43.51. the price per M ft.
Selling price for Style 4 resawed $43.51
Selling price for Style 1, 13/16" 42.00
Difference in price $ 1.51

The difference in price is the usual differential between cost of manufacturing a resawed box over one of 13/16", but considering that the "spread" in selling price is usually greater it is quite possible to have one discount for 13/16" and another for resawed. The discount would not be the same for all White Pine boxes and boxes made from cheaper lumber.

The Differential Price List will carry tables for the following thickneses 1/4", 5/16", 3/8", 7/16", 1/2", 9/16", 5/8", 3/4" and 13/16". Each table carries Gross prices for each pair of parts for .10 ft. to 29.95 ft., surface measure.

New Course on Estimating

The Millwork Cost Bureau, of Chicago, have just issued a new Estimators' Correspondence Course as a service to members. This is one of the most valuable and comprehensive courses of its kind which has ever been offered to woodworkers. It consists of work on five sets of plans and includes the taking off of quantities and the application of Cost Book "A," which is the basic cost list issued by the Bureau, to the special millwork required for these structures. The student is thus given a thorough grounding in the reading of plans, the taking off of quantities, in making out lists of material and in the figuring of costs through the application of Cost Book "A".

The course is open to members, who may enrol as many of their staffs as they like without extra charge. When the work has been covered in a satisfactory manner and the Bureau is satisfied that the student has a thorough grounding in the various phases of estimating and costing covered, a certificate or diploma is issued which indicates that the student has mastered the Millwork Cost Bureau's system.

A simple appliance can be used to put on the mouldings or boards as they go through the machine to tell how many feet has been machined during the day.

Volume of Residential Building Increasing

The building industry is so closely allied with the woodworking and furniture manufacturing industries that it may be used as a barometer to indicate what may be expected in the two latter fields. As conditions improve in the construction field, it is bound to have a beneficial effect on woodworking in general and to result in a stronger demand for wood products of all kinds including furniture and even phonographs and pianos. This is specially true when the trend of building development is toward an ever-increasing volume of residential work. For this reason the woodworking and furniture industries can take heart from the way the building industry is opening up in the early months of 1922.

In the residential field contracts were awarded in January 1922 to the value of $2,363,700, according to MacLean Building Reports, Limited. This increased in February to $4,049,200. and in March showed a still further advance to $5,930,800., or a total of $12,343,700. for the first three months of 1922. It is only when we compare this figure with those for other years that we are able to determine just what this may mean. During the first three months of 1919 the total volume of residential work awarded was $4,250,000. The figure for 1920 was $8,750,000., and the same for 1921. It will, therefore, be seen that the total for January, February and March 1921 is three times as large as for the same period of 1919, and 50% greater than for the corresponding periods of 1920 and 1921.

The value of contracts awarded for business blocks does not compare quite so favorably with past years, though it is 50% greater than 1919, but is considerably under 1920 and 1921. During January ,February and March 1922, contracts for business buildings which include stores, office buildings and warehouses, are given at $9,590,400.

In commenting on the probable trend of building activity during 1922, MacLean Building Reports, Limited, Toronto, have this to say,—"On every side are indications that there will be a sound volume of new construction for the year 1922. The volume of contemplated new work reported in Canada during March amounted to $23,773,100., while the total value of contracts awarded during the same month was $13,465,000., as compared with $10,718,000. in February and $10,256,700. in March 1921. Residential building accounted for 44.6% of the March total and business building amounted to 39% of the total. A significant feature of the March construction record is the increase in business buildings over February. During February the wholesale price index of 48 building materials advanced slightly and is now 89.2% above 1913, compared with the peak of 183.8% reached in May 1920. Prices of building materials have now declined 51.6% from the highest point reached."

How Chair Manufacturers Keep Down Costs

The fabrication, into small rough stock of low grade lumber produced in such relatively enormous quantities at every hardwood sawmill and even the use of wide edgings, thick slabs, and long trimmings for this purpose is to be the newest development and one of most wide reaching effect in the wood working industry. In the work now being conducted by the Forest Products Laboratory along these lines, some remarkable information is being collected in the chair industry. For instance, it has learned that certain chair manufacturing companies, who are noted for their low production costs and economical use of raw material, attribute their success to the wide use of small rough dimension stock cut to meet their requirements and to material purchased in semi-finished form ready for the sanding and shaping machines. Upon further investigation the Laboratory has ascertained information that these particular materials have, in a majority of cases, been produced entirely from low grade lumber and sawmill by-products such as slabs and edgings which otherwise would have been disposed of as waste. In spite of these facts, this material bought by these chair companies in a ready-cut or semi-finished form has been of as good, and in some instances, higher quality than that which could be produced from lumber at their factory. Much other information of the same nature is gradually being assembled and it all points to the practicability of the more extended use of small dimension stock in the chair and other wood-using industries.

The work by the Laboratory crews on intensive studies at chair factories throughout the United States continues. In all, studies extended over periods of about 30 days each have been made at nine different chair factories. In these studies the members of the crew actually tally the dimensions and grade of all lumber going across the cut-off saw and through the rip saw, and the resulting products of these two operations. In addition they are collecting information on the relative cost of band sawing versus the bending of curved chair parts. Soon the crew will move to western Pennsylvania for one of two additional studies.

After a careful survey of the different classes of conditions existing throughout the chair industries, the Laboratory believes that the data obtained in these 11 or 12 studies will be truly representative of the entire industry. The general report which is to be a summation of the statistics, cost information, waste data, etc., collected in all these studies, will be published as soon as the mass of figures can be worked up.

Keeping Down Manufacturing Waste

The first step in an endeavor to reduce waste is to ascertain the cause; in fact some consider that waste reduction is largely a matter of turning the limelight on the cause and then applying the logical remedy.

Before any attempt to reduce waste can be entirely successful, it is necessary that the full co-operation of all employees concerned is first secured. In some plants a bonus system has been worked out whereby employees benefit in proportion as they are successful in keeping the waste percentage below certain standards. Another suggestion that has worked out advantageously is to distribute circulars among employees, listing all possible sources of waste, then show how each waste occurs and suggests how it may be reduced. In this way the matter is brought very forcibly to the attention of all concerned.

If the question of waste reduction is enlarged to include not only material wasted, but time and effort that is not 100% productive, a worth-while reduction in manufacturing costs may result.

A nail driven across the grain holds tighter than one driven with the grain.

J. Walter, Sr., Passes

The sudden death of J. Walter, Sr., president of J. Walter & Sons, Limited, Kitchener, Ont., which occurred recently, came as a shock to his many friends and business acquaintances in the furniture and allied fields. Previous to his demise, he was enjoying the best of health and being stricken suddenly, passed away inside of twenty-four hours.

The late Mr. Walter was well and favorably known to furniture manufacturers in connection with the development of wood fibre ornaments for furniture; in fact he was the originator of this form of ornamentation. His earlier education was received, while still a very young man, in the art schools of Germany and France. After emigrating to this continent, he worked for many years as a sculptor. The federal buildings of Detroit, the various churches and other buildings in different parts of the United States bear evidences of his skill along this line.

J. Walter, Sr., Kitchener, Ont.

The idea of making furniture trimmings was first conceived in Detroit some 20 years ago. After spending a great deal of money, time and effort the process was perfected and now fibre ornaments are an every-day commodity and are found in all grades and classes of furniture.

Many Canadian furniture manufacturers will remember Mr. Walter as being the first man to imitate the wood grain by casting a plaster paris composition into rubber moulds. As far as grain imitation is concerned, this method has never been surpassed, but the durability of the resulting ornament was wanting. However, both methods and materials have been improved and developed and the wood fibre carvings of to-day are the practical culmination of his earlier visions.

Of late years he confined his activities to designing and originating ornamentation that will in all probability be looked up to for years to come. Last summer he spent some six months in Europe assimulating new ideas in ornamentation. Since his return he has designed many new and original ornaments but, unfortunately, did not live to see them introduced to the trade.

It might not be amiss to mention that while his death was rather sudden, being seriously ill hardly twenty-four hours, it was his own prediction that his passing away would be brief and unexpected. For this reason his last two years have been spent largely in so organizing his business that it would be successfully carried on after his demise. The business he organized has developed to such an extent that it is entering the export field. Orders have been secured in the following countries:—England, Scotland, Ireland, Holland, Belgium, France, Spain, South America, South Africa and Ceylon.

The Late George Lippert, Sr.

Elsewhere in this issue will be found a reference to the passing of J. Walter, Sr. In the death of George Lippert, Sr., Kitchener loses another prominent and progressive citizen. The late Mr. Lippert was president of the Lippert Furniture Co., Limited, Kitchener, Ont., and for the past 17 years had been a member of the Kitchener Life Commission, of which he was chairman for many years. It is, probably, as a successful furniture manufacturer that he is most widely known, being one of the oldest manufacturers in this field.

The deceased served his apprenticeship at the old Simpson factory in Kitchener. Being ambitious and industrious he wanted to see how business was conducted in other plants, and for a number of years was an employee of the H. Krug Furniture Co., Limited. He was a first-class cabinet maker and machine hand and as he gained in experience, he yearned for a business of his own. In 1893 he entered into partnership with the late Henry Schaefer, and started manufacturing in Waterloo in what is now known as the Woeller-Bolduc factory. For over five years this firm carried on successfully and then Mr. Lippert decided to branch out for himself. A factory was erected on Louisa St., Kitchener, in 1899. As the business increased, additions were made to the plant from time to time. Strict attention to business usually means success, and the present commodious factory is a monument to the late Mr. Lippert who saw great things in store for his growing industry

Permanent Mahogany Association

The Mahogany Association which was formed in New York some six months ago to conduct an extensive publicity campaign in favor of this wood was, at a meeting held in New York on March 2nd and 3rd, turned into a permanent organization. Among the officials of this newly-formed Association are T. R. Williams, F. B. Sawyer, H. Freiberg, F. G. Otis, C. C. Mengel, Jr., and Douglas H. Allen. The members of this organization comprise virtually all the importers and manufacturers of mahogany in the United States.

Two More Firms Settle with Perkins Glue Co.

It is reported that the Breece Manufacturing Company of Portsmouth, Ohio, and the Globe-Wernicke Company of Cincinnati, Ohio, have settled with the Perkins Glue Company for their infringement of Perkins Glue Company's Vegetable Glue Patent. It is understood that the amount paid was very substantial in both cases.

Information and Inquiries

You are cordially invited to make use of this department

How to Kiln Dry B. C. Fir

London, Ont.
February 17th, 1922.

Editor, "Canadian Woodworker,"

Will you kindly publish some information dealing with the kiln-drying of B. C. fir? We have experienced some difficulty in drying this wood, chiefly from checking, and think that other readers would appreciate the same information.

Sincerely yours,
Dyment-Baker Lumber Co.

The following information submitted by J. O. Cameron, president, Cameron Lumber Co., Victoria, B. C., covers the kiln-drying of B. C. fir in a practical manner:

"We find in practice that we can make a better job of kiln-drying the fir green from the saw than to undertake to dry it after it has become partially air dried.

"Many systems have been used in kiln-drying fir, most of which if carefully watched and carried through in an intelligent manner will produce good results. The latest development is that of using first live steam to get the lumber thoroughly heated through and through, the grain all soft and tough, and then using a draft of hot air which is passed through the kiln and the lumber is quickly dried to the required degree of moisture content. We use two types of kilns, one is what is known as the "Oldfield" type, which is a quick drying kiln. This kiln does not work very satisfactorily on any except one inch lumber, which can be dried successfully in from twenty-two to twenty-four hours.

"The kiln is charged with lumber and closed up tight, live steam is then turned in until the lumber has become thoroughly heated through and saturated. This last in case the lumber is not thoroughly green at the time it is put in the kiln, but if green lumber from the saw is put in it is not necessary to put the live steam in the kiln. The temperature in that case is raised to about 280 degrees to 300 degrees, which is above the boiling point and all moisture in the lumber converted into vapor, there is then a system of vents which are opened and allows this vapor which has been steamed out of the lumber to escape into the air. The lumber is then allowed to remain in the kiln with the vents open until it has had an opportunity to drop down to a reasonable temperature, say 100 degrees or less when the kiln is opened and the lumber removed. The point being that it would not do to open the kilns and expose the dry lumber to the cold atmosphere when it had been at a temperature as stated of 250 to 300 degrees.

"The other type of kiln we use is known as the "North Coast Dry Kiln." For the purpose of allowing you to see how that is handled, I am quoting the words of our planer superintendent, Mr. Axel Bulow. You will see from his statement just what he considers to be the proper method of handling this kiln:—

"The kiln most extensively used on the Pacific Coast is of the progressive type, that is, as a dry car is discharged a green one put in, but as it is not satisfactory, we charge one whole kiln with green lumber of as near the same size as possible. When using an ordinary kiln that way a steam pipe must be provided running the whole length of the kiln, and with perforations on top side for controlling the humidity.

'Small sizes, say up to 1" x 6" can be dried in forty-eight to sixty hours, depending on circulation and temperature.

'Starting with 100 degrees Fahrenheit and 100 percent relative humidity and gradually increasing the temperature so in twelve hours it would be about 160 degrees and 50% relative humidity, and in forty-eight hours, 190 degrees and 15% relative humidity. Providing the circulation is good, the lumber will then contain about 10% moisture which is considered dry for ordinary use.

'Lumber 1" thick and wider than 6" can be successfully dried in eighty hours, starting the same way as on the narrower stock with gradual increase in temperature and decrease in humidity, so as to finish at 175 degrees and 30% relative humidity. Two inch stock requires an additional ten hours with somewhat lower temperature.

'When temperature, humidity and circulation are properly controlled, we experience very little difficulty in drying fir and have only a small percentage of degrade, in fact, much less than in air drying.'

"I hope that our statements here may prove of some benefit to your Eastern readers. There is no trouble about the kiln drying fir lumber successfully if it is handled in a proper manner, and I believe that I may state that any system of handling other woods, such as, oak, maple, Southern pine, if followed as with fir will produce as good results. In other words I do not consider that fir is any more subject to checking, warping and otherwise becoming injured by kiln drying than other classes of wood."

Brass Cups for Candle Sticks

60 High St.,
St. John, N. B., March 25th, 1922

Editor, "Canadian Woodworker."

Would you please inform me as to where I can purchase some ferrules or cups for the top of wooden candlesticks. Would prefer to secure these in Canada, if possible.

Sincerely Yours
John O. Baxter

It is more than probable that you can secure these candle-holders from Larsen & Shaw, Limited, Walkerton, Ont., or from the Hahn Brass Co., New Hamburg, Ont.

Market for Short Cedar Pickets

Warren, Ont.,
March 20th., 1922

Editor, "Canadian Woodworker."

Would you kindly give me any information you have in regard to the market for cedar pickets? I have a lot of 4-foot cedar logs and thought I might saw them into pickets, if a market exists.

Sincerely yours
D. I. Warren

At the present time there is very little demand for pickets of this kind, not enough to warrant you engaging in their manufacture. Would suggest that

you look around and see if you cannot decide on something which is in much stronger demand. You might be able to turn your cedar logs into shingles. There is also a possibility that you could work them into crating lumber for crating furniture and other articles. They might also be turned into certain kinds of boxes. Another suggestion is that you might run this material into V or beaded sheathing and bundle it and sell it as wainscotting.

Woodworking in N. B.

Newcastle, N. B.
April 7th, 1922.

Editor, "Canadian Woodworker,"

If possible, I would like you to give us any information you can on the subject of woodworking, that is to say, what articles can be successfully manufactured in New Brunswick from native woods? Would excelsior or wood wool, made from poplar, be practicable in your estimation?

Kindly let me hear from you.

Sincerely yours,
H. C. Rundle.

It is practically out of the question for us to make suggestions along this line as we are not in a position to study the requirements of your local market. As far as excelsior is concerned, it is quite practicable to make this wood from poplar, in fact this wood is preferred by most excelsior manufacturers. Whether or not it would pay you to engage in the production of this material, depends entirely on the demand which exists in the Maritime Provinces, as it is doubtful if you could successfully enter the Quebec or Ontario markets. Have you considered the idea of a small general woodworking plant catering to the demand for special woodwork of various kinds and perhaps manufacturing some simple articles for which you could find a ready sale?

Definition of Term "Superficial"

Truro, N. S.,
April 4th, 1922

Editor, "Canadian Woodworker."

I would be pleased if you will explain the meaning of the word" superficial" when applied to lumber. I have often seen this word when ordering this material, such as "500 superficial feet of sheathing." Does it mean surface measure or board feet?

Sincerely yours
W. H. Faltenhine

"Superficial" is another term for "square feet". When applied to flooring, such as "50 superficial feet of flooring," it would call for sufficient material to cover 50 superficial square feet. It thus differs from strip measure as used for flooring, sheathing, etc., where 1000 feet strip measure might only cover 800 square or superficial feet of surface depending on the width allowance.

What would you say was the percentage of serviceable wood in an ordinary tree?

When you cannot afford a pneumatic system to remove your chips, and dust, sack them up as often as possible, as this will reduce fire risks.

Special Furniture Week at Windsor

A "Furniture Fashion Week" is scheduled for Windsor, Ont., during the week of April 24th-29th. This is being held under the auspices of the Home Furnishings Bureau working in close co-operation with the retail furniture dealers of the Border City. The furniture retailers are taking an active interest in this event and are leaving no stone unturned to make it an outstanding success. Special displays of attractive furniture are being arranged in the various stores, showing desirable room arrangements. Various public and educational bodies have entered into the spirit of the scheme and are supporting he movement by every means in their power.

The "Furniture Fashion Week" is being advertised extensively all this month, and during the period the show in on, a large volume of high-class copy will be carried in local papers. It is expected that the dealers working with the Home Furnishings Bureau, will carry an attractive two-page spread for the entire week.

If suitable arrangements can be completed in time, a series of lectures will be given on various phases of home decoration. Such subjects as color schemes, arrangement of furniture, furniture styles, how the home can be made more attractive, etc., will be covered. This is in line with the lectures being given in various American centres by Ross Crane of the Art Institute of Chicago.

While it is expected that a considerable volume of furniture will be sold during this show, yet the main objects behind the scheme are to arouse a greater interest in the home and to create a desire for better home furnishings, better furniture and more attractive home surroundings; in other words, to make "better furnished homes" a reality and thus create an enlarged and permanent interest in better furniture.

Conveyor Belts for Waste Removal

There seems to be a tendency among the more progressive woodworkers to instal a belt conveyor system under the machine floors to carry all waste edgings, trimmer blocks, etc. At regular intervals in the floor, openings are made which lead directly to these conveyor belts. It is a very easy matter to raise the cover and shove the edgings through the opening. In the case of some machines, such as the swing cut-off saw, the opening can be placed under the table and left open at all times. When this is done, the swing cut-off saw-man drops the waste pieces through the hole as they are made so that they are carried away without any additional handling.

A system of this kind not only does away with unproductive labor in the removal of this waste, but the productive work men are not interfered with by the trucking away of this material.

U. S. Piano Production

According to well informed authorities, there were approximately 175,000 pianos made last year in the United States, although some estimates are below that figure. Ten years ago there were 350,000 pianos made and shipped and in 1919, according to the census report there were 336,000 manufactured. In view of the heavy increase in population, the reduced output of pianos is difficult to explain.

Upholstring and Trimming

How Winged Chair is Developed

Treatment of Arms and Wings—Special Care Required to Keep Stuffing on Arms and Wings Same Depth

The next step in the upholstering of the chair described in the March "Canadian Woodworker, is the building up of the arms and wings. The arms require considerable shaping-up, and for this reason it is best to double-stuff them, keeping the stuffing soft and giving the edge a single stitch to create the foundation shape, as illustrated in Fig. 92.

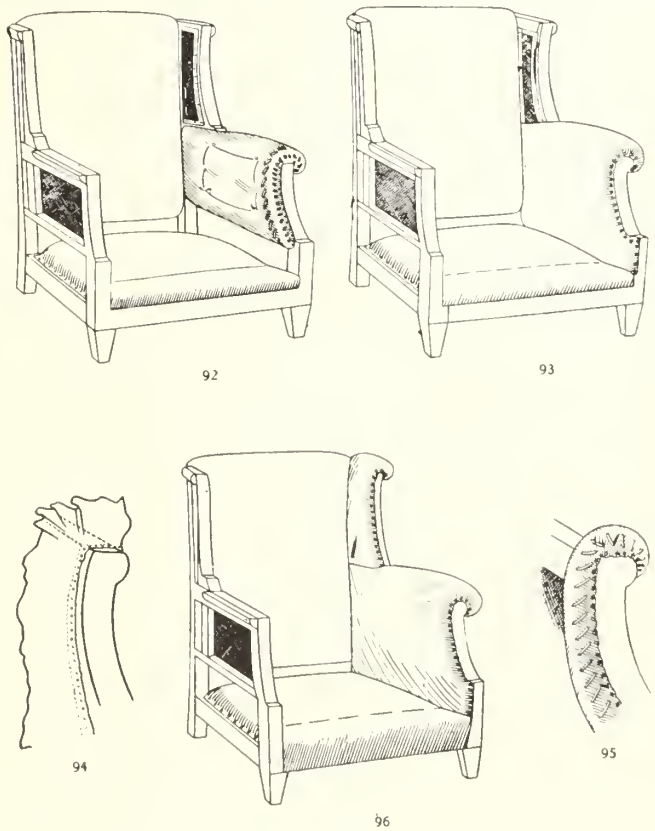
It is well to continue the upholstering of the arms up to the muslin stage before treating the wings, because the wings must be built out to the same thickness as the upholstering of the arms, so that the join, where the two meet, as shown at XX in Fig. 97, must be absolutely smooth so that the covering may be continuous with the seam at this point.

The arm, as it appears in the muslin stage, is illustrated in Fig. 93. It may be possible to double-stuff the wings, but a stitched nosing answers for all practical purposes. The canvas for the nosing is back-tacked on the front of the wing, as shown in Fig. 94, allowing sufficient fullness for the corners, so that it may -be stuffed up and stitched to form the sym metrical roll illustrated in Fig. 95. This section is then lightly covered with hair and shaped up in muslin, as shown in Fig. 97.

The join between the wings and arm is blind-stitched in the muslin so to make a smooth continuous surface. When completely covered in the muslin, this chair has the appearance shown in Fig. 97, and is then ready for covering.

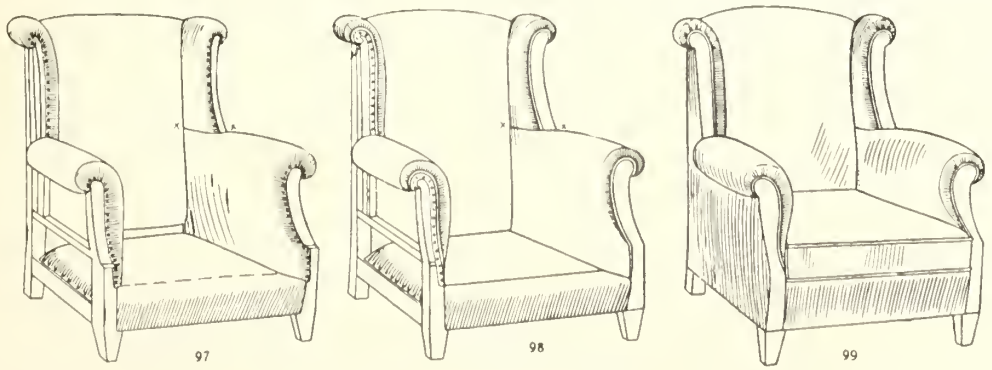
We need not here go into details with regard to the covering of this piece, because in all respects, the handling of the covering is the same as we have described for other wing chairs, the coverings for the arms and wings are fitted into position and pinned together so that the seam at XX Fig. 98, may be machine-sewn and pressed, presenting a smoothly finished appearance.

The chair in the completed illustration, Fig. 99, shows a welt surrounding the panels on the front of the arms and wings. This welt may be provided in either of two ways; it may be tacked to the face of the arms and wings, as shown on the left side of Fig. 98, or it may be tacked to the back of the wooden panels and finished on the front of the arms and wings. These wooden panels are covered and the covering carried around underneath the outside lin-



Double—Stuff Arms Before Treating Wings

Please Turn to Page 82



Wood Panel on Face of Arms and Wings not Essential Though Often Used

ings after the panels have been tacked into position.

It is possible to do without these panels, but the chair we have illustrated is provided with them and therefore we have carried through the explanation of their use.

Packing Should Receive More Attention

Dealer put to Considerable Annoyance and Loss Because of Poorly Packed Furniture—Retailer Would Gladly Pay Slightly More for Better Packing

By A. W. LUHRS

The question of the proper packing of furniture for transportation has long been a source of annoyance and study for the furniture shipper. Under present conditions of keen competition many manufacturers believe it a positive necessity for them to pack and route their goods in such a way as to insure as little damage as possible, feeling that satisfied customers are valuable assets to their business. However, the fact that all shippers do not feel the same is generally known and is evidenced by the views of one shipper who says: "the railroads are charging me 10 times as much to haul my freight as they are to haul pig iron. I don't believe in packing my goods well for if they are damaged, the roads, because of the high rates, can afford to pay, and I'll send the retailer another shipment, in that way saving the cost of better packing and the freight on it."

The consignor, whose goods are often damaged due to improper packing, even though he thinks he is saving money on his packing, forgets that he is losing in another way more than he is saving. For example, the annoyance and costs of filing claims for the consignee, or of furnishing data to the consignee where he files the claim, amounts to a very considerable item. The loss of business due to poor packing is frequently great and in this connection I have found that many retailers buy goods from one manufacturer rather than from another because of the good condition in which the first shippers' product arrives, even though his price is somewhat higher.

Effect on Freight Rates

Freight rates are usually based, among other things, on the handling of a commodity and its liability to damage, which is especially so now under the Transportation Act. This Act allows the carriers to earn but a certain percentage, after which rates must be lowered, and as damage claims paid are of course deducted from earnings, the greater the claims, the less is the possibility of a reduction in rates on that commodity. It is only reasonable to suppose that the entire furniture trade is paying high freight rates at the present time, partially due to the fact that the claims, because of the poor packing of some members of the trade, are exceptionally high. It appears logical to suppose that with a reduction in claims there should be a corresponding reduction in rates.

Because of the differences of opinion existing between some shippers, the railroads, and the members of the Trade Associations, it appears that the time has come for a complete study of the subject from all angles. It is expected that the question of the packing of furniture for rail transportation will be settled on its merits, so that on this important subject there may be harmony between the members of the Trade Associations and between the Associations and carriers.

Comparative Cost of Packing

In the New England states the cost of good crating material and labor is comparatively high and a good crate for a bureau or for 6 chairs costs complete about $1.25. For that reason manufacturers believe that for case goods costing under $15.00 each, a packing costing but approximately 50 cents, burlap and excelsior, is what should be used both for carload and less carload shipments, while higher priced articles should be well crated. It is obviously impossible to ship the mirror along with the bureau when it is packed in burlap, so where one consignee is to receive several bureaus the mirrors are packed together and crated in another crate, while when the piece is crated the mirror is sent along with the furniture. In the one case the total cost of the complete shipment is not over $1.25, while in the other the burlaping costs 50 cents and for an average of 4 mirrors in a crate an additional 25 cents per mirror, making a total of 75 cents for the complete bureau. This shipper figures that he has saved 50 cents per bureau on the packing and in addition the freight charges on the lumber of the crate. What does his customers say? I called on the buyer of one of the largest retail stores in a large eastern city who told me that he no longer buys his goods from this same shipper, who packs his shipments in burlap, be-

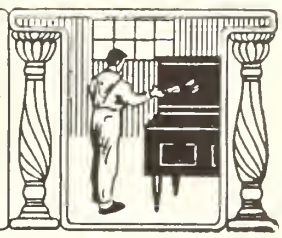
THE FINISHING ROOM



Spraying for Speed and Satisfaction

Perfected to Meet Demands of Time Schedules—Important Factor in Finishing Work—Mechanical Devices Lessen Labor—All Finishing Materials Handled to Good Advantage

The old Italian craftsman, working beneath the shade of the Umbrian hills, applied his finishes to the cabinet he had made, or to the table, chair, or other master production, slowly and patiently by hand. Why should he not, time being no element of importance? This table he was making for the Duke, or that chair he was making for the Cardinal, or yonder cabinet he was finishing for some merchant prince—these were the total of his production for many weeks, perhaps month. There was not overly much good furniture to make, only the grand and the powerful could afford these masterpieces. Time was but a trifling account.

The young workman in the busy finishing department of the modern furniture factory, working beside the busy hum of large factory production and the speed of today, applies his finishes with apparatus that has been perfected to meet the demands of time schedules in the busy modern days. Time is an element of commanding importance—in many ways, it is the element of utmost importance. But at the same time, hurry and speed must not sacrifice perfection. It is of equal importance that the buffet or the table or the dresser that is to find its way into some American home must have the same pleasing and durable finish as the Duke's table, the Cardinal's chair or the merchant prince's cabinet.

Era of Productiveness

Then, too, today the finishing department is called upon to make pleasing in appearance and durable in use many thousand times the number of pieces that were made in a whole land in the older days. For better, for worse, we are living in the age of machinery production. Skill of hand is no less, perhaps it is more than formerly. Art still holds its place but is allied with modern methods and means.

A trip into the finishing room of any great furniture factory will demonstrate the wonderful skill and the exact perfection of modern methods of spraying finishes by air. In several of the larger factories visited on a recent trip, one was impressed with the results won by the finishing departments that were equipped with spray finishing equipment. Here, for instance, was a factory making reed and wicker articles, articles that demand a great deal of skill to finish and which under the operation of hand work would eat up time by the decade and increase production costs by the hundreds of dollars. Today there is a great demand for reed and wicker, and without equipment like spraying devices, manufacturers of such furniture would be unable to meet the demands. Manufacturers on every hand, who specialize in the production of reed and willow furniture bear testimony to the worth of such devices, and maintain that not only do such machines increase production but are far superior to hand work.

Aids to Handling Articles

One of the outstanding features of such a system is its ease of operation. The devices are so designed that the articles may be handled very quickly and easily by the operator. The heavier or more cumbersome pieces of furniture can be raised, lowered and turned at the desire of the operator by a cleverly constructed pneumatic lift turntable which is made in two sizes. These devices are most convenient, as they eliminate unnecessary handling, the work can be done very quickly.

Wood fillers can be applied with the air brush from overhead containers. If designed, agitators can also be attached to these containers which keep the material in suspension.

Shellac may also be used with the same air brush, from another container.

Varnishes can be drawn directly from the original drum or barrel and applied smoothly and evenly.

The equipment for this class of work, while essentially the same as the larger outfits, differs only in the size of the cabinets. The accessories used in connection therewith are identical. Six-foot cabinet installations are the most popular as they will also accommodate benches as well as chairs. Divans, longer tables and benches should be finished in the eight-foot cabinets. The forty-inch regular style turntable is recommended for use with these articles.

All furniture finishing equipments should provide for the varnish to be used directly from the original container, if production warrants its being used in large quantities. Whenever enamels are used the pressure feed tanks in capacities of four, eight and twenty gallons should be employed.

Specially Effective on Chair Work

It has been conclusively demonstrated that all chair factories, irrespective of their production, or the extent thereof, should use these equipments. It reduces their costs, makes them independent of exorbitant demands of unreasonable laborers, and renders it possible to manufacture their products at a larger margin of profit than those factories employing the hand brush methods.

The efficiency of the equipment is everywhere evidenced by results. Good work, done well and quickly at the greatest saving of time and the least waste of materials, is a "consummation devoutly to be wished." Here is this gigantic factory the air devices were doing that very thing.

In the finishing of phonopraph cabinets, under conditions that demanded not only speed, but low cost of production and good work, the air device won its laurels in the finishing rooms of hundreds of factories all around the country. Twin installations where two machines used a single exhaust unit were

great favorites. Two men worked these, one placing the cabinet in its proper position and the other doing the spraying, a combination that worked for great speed in the work.

Specially devised equipment for the finishing of toys, juvenile furniture and novelties have come into general use. One of the most popular of these is that which provides working space for three operators. This is for particular work on small pieces, and larger equipment is necessary for larger pieces. Picture and mirror frames, machinery and castings, pianos, automobiles and leather novelties, all these and a myriad of other things are now given their finish by equipment such as we have been describing.

Efficiency of Exhaust Important

The air brush and exhaust are the two most important units for industrial finishing equipments, according to many finishing room experts. In the efficiency of the exhaust system depends the disposition of the operators performing the work, and the safety of workmen in the immediate vicinity of the cabinets. The fumes and odors can only be carried off and out of the cabinet and finishing room by an exhaust of sufficient power and size.

An erroneous impression prevails in some quarters that an exhaust fan used for discharging hot air from a shop will properly function for carrying out fumes from varnishes, paints and enamels. This is untrue. The exhaust must be especially designed and constructed for this purpose.

The object of the finishing cabinet and exhaust units is to eliminate all fumes and odors which result from the atomization of liquid finishing materials at high pressure. It is therefore very easily observed that one of the most important devices to the efficiency of this equipment is its exhaust system.—Furniture Index.

Good Varnish—How to Test It

Outline of Tests and Specifications for Varnish for Interior Work—Qualities to Look For in Varnish—How Tests may be Made to Determine Desirable Properties

(concluded from March issue)

The first part of this article, published in the March issue, gave an outline of the qualities which should be found in good varnish and how tests for appearance, color, flash point, non-volatile matter and drying time may be made. Tests for other desirable properties are described in the following paragraphs:

(f) Toughness.—Thoroughly clean with bensol a sheet of bright tin 7.5 by 13 cm (about 3 by 5 inches). Flow the varnish on one side of the tin plate and set in a vertical position in a well-ventilated room, not in the direct rays of the sun, at a temperature not below 21 deg. C (70 deg. F.)

After the varnish on the tin plate has dried for 48 hours bring to a temperature between 21 and 24 deg. C (70 to 75 deg. F.), and with the varnish film on the outside, bend rapidly over a rod 3 mm (1/8 inch) in diameter. The film must show no evidence of cracking or flaking.

(g) Water Resistance.—Prepare a panel as in (f) and let it dry in a well-ventilated room for 48 hours. Place the panel in a beaker containing about 2.5 inches of distilled water at room temperature (immersing the end of the panel which was uppermost during the drying period) and leave in water for 18 hours. The varnish shall show no whitening and no more than a very slight dulling when observed after removing the panel from the water and drying for 2 hours.

(h) Flowing and Rubbing Properties.—Thoroughly clean with benzol a glass plate about 15 by 20 cm (6 by 8 inches). Flow the varnish so as to entirely cover one side of the plate and stand in a nearly verticle position with the long edge horizontal for 8 minutes. Then draw lightly a 25 mm (1 inch) section of a hard-rubber comb (having 8 to 10 teeth to the centimeter) horizontally across the varnish surface, first 2 cm from the bottom and then 2 cm from the top of the plate. Let panel stand in the same position for 20 minutes longer then lay flat. An exaggerated condition of a dusty room shall be created by rubbing some cotton batting between the hands immediately over the panel. Let panel dry for a total of 48 hours in a well ventilated room. If the comb marks show at this time, the varnish shall be rejected. If no comb marks show, the surface shall then be rubbed with pumice flour, water and a felt pad with long, even, firm strokes back and forth in one or another direction, but not in circles, until every portion of the panel has been rubbed. Most of the pumice will then be removed from the pad and panel, and the varnish film given a "water rub" with the pad.

A satisfactory rubbing varnish in the above test will yield a smooth, dull film, even at those places where the dust particles have been encrusted in the film, and shall show no spots where the pumice has been ground into and become attached to the film, nor show any other evidence of gumming. No sweating shall occur anywhere on the film in 18 hours after rubbing.

(i) Gas Test.—Apparatus.—The necessary apparatus consists of a glass bell jar approximately 20 cm (8 inches) in diameter and 30 cm (12 inches) in height, inside dimensions, having a ground-glass rim; a ground-glass base plate of suitable size; a small, kerosene glowlamp without chimney, or a small alcohol lamp filled with kerosene, using a round wick not over 6 mm (¼inch) in diameter and adjusted to give a flame 2 cm (4/5 inch) in height. A wire or a light wooden frame is fitted inside the jar and provided with a support for holding a disc of tin plate 15 cm (6 inches) in diameter in a horizontal position 5 cm (2 inches above the wick of the lamp.) The frame must also be provided with several other supports above this disc for holding in a horizontal position the various varnished panels under test. The test panels consist of semicircular pieces of bright tin plate approximately 15 cm (6 inches) in diameter.

The form and arrangement of the above apparatus is designed to provide an even distribution of the products of combustion over the test panels.

Method.—First determine the normal time required for the varnish under examination to set to touch

at room temperature. Divide this time by five to arrive at the different drying periods at which the varnish is to be tested in the gas tester. Thus, if a varnish sets to touch in five hours samples should be tested for resistance to gas at drying periods of one, two, three, and four hours; it is needless to use the fifth or five-hour period for the above varnish which has set to touch is practically immune to injury from gas fumes. Similarly a varnish which sets to touch in one hour should be tested for resistance to gas at drying periods of 12, 24, 36 and 48 minutes.

Example.—A varnish which sets to touch in five hours is tested as follows:

First, clean two of the semicircular, bright, tinplate panels carefully with benzol. Flow the varnish on one-half of panel No. 1 at, say, 10 a.m., and allow to drain in a nearly vertical position at room temperature. At 11 a.m., flow the varnish on the other half of panel No. 1; allow to drain as before. At 12 a.m. varnish one-half of panel No. 2, and at 1 p.m. varnish the other half as above. At 2 p.m. place the two panels close together in a horizontal position on the upper supports of the frame. Light the lamp and set it under the circular tin. Place the bell jar in position, centering it as nearly as possible, properly seated on the ground-glass plate. If the chamber is tight and lamp properly adjusted, the flame will be extinguished in about four minutes. After the panels have been in the chamber for half an hour, remove the bell jar and examine the varnished panels for gas effects.

The varnish on all four sections should remain bright and clear without trace of pitting, "crow's footing," frosting, or other defects.

Attractive Brown Shade for Oak

by C. H. G.

Furniture styles change pretty much as the styles in hats and dresses, though the changes are not quite so frequent or so radical. They do change from time to time though, and in changing, alter the popular demand for different kinds of wood.

Those who recall the days when black walnut was occupying the centre of the stage in woodworking, remember also that walnut went out as oak came in as the chief material for the manufacture of furniture. They will also remember that the thing which seemed to please the public most about oak was the marked figure obtained by quartering at that time, and for some years later, quartered oak with a splashy figure, the larger the better, had the preference. People who had been using walnut, which was dark and with comparatively little figure, seemed to be pleased at the opportunity of getting furniture which "talked," and which, while not exactly loud, could properly be described as extreme. Then mahogany began to have a big run.

During the past few years, however, it has been apparent that the pendulum is swinging in other directions both as to figure and wood. Walnut with its small figure and its quiet aristocratic appearance is again taking the lead as material for the furniture work. It is light because of its brown wood, and browns are once more in fashion, and because it has a good appearance without too much figure.

Furniture manufacturers who have a large stock of oak on their hands and especially plain oak, have deemed it advisable to manufacture oak furniture with little or no figure in a beautiful brown color. This brown oak will eventually be the greatest in demand. There are several methods used in producing this color, but for a rich transparent color, a water stain is the superior. After the stain is thoroughly dry, the wood should be sand papered, smooth and filled with a walnut filler. After the filler is dry, it should be coated with waterproof lacquer. When dry, sanded and given another coat and then sandpapered and waxed with the best old English wax.

Cutting Down Finishing Costs

A reduction in finishing costs can be made by giving greater attention to the preparation of the surface in the factory proper. The smoother and more uniform the surface to be finished, the less work and the less material will be required in the finishing department. This is true to such an extent that some furniture manufacturers have been able to reduce the number of coats of varnish from four to two and produce a better finish. Not only is there a saving in material and in its application, but there is less rubbing to do as the varnish flows evenly and lies flat on a smooth surface, whereas if there had been slight imperfections, additional labor would have been required in the rubbing department to overcome such inequalities. It is not fair to the finishers to expect them to overcome indifferent work on the part of the woodworking department, and any extra expense which might be incurred in an effort to improve the woodworking operations would be more than offset by the saving which would result in the finishing department.

Shellac a Scarce Product

At the present moment there is a shortage of shellac and as a consequence the price has soared. In the opinion of many importers prices will remain where they are until well into the summer months. The advance in shellac values were such that many importers felt that the market would not be sustained, with the result that they did not buy, as usual. This partially accounts for the shortage at present experienced. In addition to the scarcity of this product general conditions of unrest in India must also be taken into consideration. The question of transportation is a vital one as railroad strikes are interfering with the transportation of up-country stocks, and sailings are being postponed on account of non arrival of shipments. Taking it all in all, it looks as if present conditions will last for a number of months.

Warning

Subscribers and other are warned against giving subscriptions or paying money to two men by the names of Garin and Barnes. These men have recently been operating in the Maritime Provinces. One Garin was authorized to take subscriptions for Hugh C. MacLean Publications, but his methods were found unsatisfactory and he was discharged. Barnes was never given authority. Certain forms bearing the name Hugh C. MacLean, Limited, and used to facilitate them in obtaining money, were printed by them without our knowledge or consent.

Packing Should Receive More Attention

(Continued from page 74)

cause of the condition in which they arrive. They are frequently damaged slightly by the carrier and then have to be worked over. Even when not damaged by the carrier, in warm weather the top surface is printed from the weight of the piece packed on top of it, causing considerable annoyance and expense to the dealer, for which he is not reimbursed by the Railroad. He told me that it is cheaper for him in the end to buy crated goods than shipments packed in burlap. In addition to the condition in which they arrive, the air in the warehouse, in which most dealers store their goods, can circulate around the furniture, if it is crated, while if packed in burlap that is impossible.

Must Withstand Rough Handling

There is no question but that freight is frequently very roughly handled by the carrier, yet, as it is known that there are certain unavoidable shocks which shipments will get, such as coupling of freight cars, switching cars over a hump, taking out the slack in a freight train when starting, occasional transferring at freight platforms, etc., it appears that goods should be packed in a way to at least withstand such unavoidable impacts. It is thought that if all the shippers were required to crate shipments costing over a certain unit price, the cost of crating would be included with the cost of the article and all shippers would then be on an equal basis, and in addition be relieved of much annoyance in connection with damaged shipments.

Other shippers say that if the retailers wanted

Why Waste Money in Your Drying Room?

Air-drying of coatings of any kind is out of the question. No manufacturer could afford it even if the best drying conditions always prevailed—which they do not.

But with Nichols Varnish Drying Equipment you always have very much better than the best natural conditions, reducing days of drying to hours, and the drying is better done: "From the inside out."

This is accomplished by producing always and automatically the correct combination of temperature and moisture, and of air that is absolutely clean.

Why is a Spray Head?

Furthermore, the spray for washing the air in Nichols Drying Equipment is produced in a simple and ingenious manner without the use of the spray nozzles, connecting pipes, pump, and strainers, all of which require so much attention and give so much trouble.

We urge manufacturers to ask us for description of apparatus and for records of its accomplishments, saving single manufacturers many thousands of dollars in reducing the time the product is held up in drying, and increasing the quality besides..

Veneers and Panels

Moisture--The Cause of Many Troubles

At Bottom of Majority of Troubles Common to Veneering and Veneered Stock—How it May Be Combatted

By S. N. JOHNSTONE

Moisture is the foe of satisfactory veneered work and must be guarded against and combatted at all stages of the veneering operation. This fact should be so emphasized and accentuated that it would be taken to heart and acted upon by all who have anything to do with veneered or plywork. A decided improvement in the quality of the veneered work and plywood being placed on the market, would result.

It might prove interesting and helpful to readers of the "Canadian Woodworker and Furniture Manufacturer" if a few of the most prevalent troubles, which can be laid at the door of moisture, were outlined, as it might tend to indicate why certain troubles occur and how they may be overcome. Once the cause is definitely known, the remedy usually suggests itself. For this reason we can tackle any veneering problem more intelligently if a persistent offer is made to ascertain the cause or causes rather than apply a haphazard remedy.

Blindly Groping for Better Results

This point was brought to mind recently in an article in which the writer stated that after being troubled with warped panels for a long time and after having tried every imaginable remedy, they accidentally discovered that the piling of the panels on sticks and allowing them to stand for a few days, gave them freedom from warping. They continued piling in this manner for months without knowing the why or the wherefore, being content with the result. The glue moisture in the panels was the cause of the warping, and piling on sticks simply meant that the moisture was given a chance to escape, and that at the same time the panels were held straight. If an attempt had been made to determine why they had had so much warping, it is probable that the solution finally hit upon would has been put into force much sooner, and considerable annoyance and expense would have been saved.

To return to the question of moisture, every effort must be made to make sure that the stock going into the cores is perfectly dry. This is absolutely essential, more particularly if different woods are mixed in the same core. In the latter event if the stock should contain some moisture, the shrinkage which occurs as the wood dries, would vary for each kind of wood, causing depressions which would be noticeable in the finished article. It is, therefore, essential that the stock be thoroughly dry, and advisable and preferable that each core be made of the same kind of wood.

Moisture Causes Sunken joints

Another trouble or fault which occurs far too frequently is sunken joints. Many a high-class piece of furniture has had its beauty and durability reduced by this common defect. The cause is glue moisture at the core joints, and the remedy is to make sure that this moisture has been eliminated or equalized before the cores are surfaced and the veneers laid.

This same line of thought could be carried along almost at much greater length and such troubles as face checks, open joints, warping, twisting and other faults common to veneered work analyzed, and in each instance the main contributing cause would be found to be moisture. That being the case, it is not any wonder that the statement is often made that moisture is the glue-room man's worst enemy.

Knowledge Not Lacking

Knowing the cause of most of our troubles, knowing the effect of moisture on wood, knowing how wood acts and re-acts as moisture is absorbed and dried out, and knowing how moisture should be eliminated at every stage of the veneering operation, it is difficult to understand why so much veneered work is found upon the market which bears unmistakable testimony to the fact that due care had not been exercised when the article was being made. There is no excuse, other than carelessness, or a gross disregard for quality of output in an effort to make as large a profit as possible.

Whatever may have been the measure of excuse in the past, there is none to-day. We have the knowledge; we know how and why, and what is more to the point, we have the equipment: efficient lumber-drying kilns for core stock, redrying equipment for handling veneers and crossbanding before laying, and panel-drying kilns, which will take care of the glue moisture in the panels and veneered stock, so that it is strictly up to each and every manufacturer to give this phrase of the work closer attention and see that his product is free from defects traceable directly to moisture.

Clamp Carrier in Heated Compartment

One large furniture manufacturer has hit on the idea of enclosing his revolving clamp carrier and heating the compartment with steam pipes. In this way the glue between the joints hardens quicker and the glue moisture is eliminated more rapidly. Another feature is that as the stock would be warm as it is carried around the carrier, a better joint would result. This same manufacturer warms the pieces to be glued by placing them on a series of chains which carries the stock through a warming compartment to the glue rolls which are situated at the far end and adjacent to the clamp carrier.

Merger of Veneer and Plywood Associations

Stronger Organization to Guard and Further Interests of Veneer and Plywood Industry —Expect Early Action on Freight Rates Case—H. B. Sale Heads New Association

Of interest to users of veneer and plywood is the merger of the National Veneer & Panel Manufacturers' Association and Plywood Association, which was consummated in Chicago last month. This action can hardly fail to have a beneficial effect on the interests and activities of the veneer and panel industry as a unit, the results of which will be to a lesser degree shared by the users of these commodities.

The name of the new organization has not as yet been selected, and for the time being the old name of the National Veneer & Panel Manufacturers' Association will be used. The suggestion has been made that the merged organization might be called the "National Thin Lumber & Plywood Association," although there has been some objection to the elimination of the word "veneer."

H. Brooke Sale, Fort Wayne, Ind., Who Heads New Organization

Has Strong Executive

H. Brooke Sale, of Hoffman Bros., Co., Fort Wayne, Ind., who was elected president of the National Veneer & Panel Manufacturers' Association last December, has been elected president of the new national organization. The executvie, who will work with Mr. Sale, includes the following gentlemen:—H. E. Kline, of the Louisville Veneer Mills, Louisville, Ky.; H. J. Barnard, of the Central Veneer Co., Indianapolis, and F. B. Ward, of the Hanson-Ward Veneer Co., Bay City, Mich. M. Wulpi, of Chicago, head of the Central Credit Bureau, Inc., will direct the activities of the new association.

In explaining the merger plan, Mr. Kline, who was chairman of the Merger Committee, said in part:-

"It was thought best by your committee that the nucleus of the present association should be maintained with only a slight change of title and that around it could be built such separate organization as the necessities of the business and the expediencies of the case warrant. Going into more detail, the plywood members are not interested materially in the necessities or the activities of the cutters. The cutters of Birch are very little interested in the cutting of gum or popular. The cutters of walnut are not interested in either of the above woods. The cutters of mahogany are perhaps not interested in any of the foregoing, and we could go on and on.

"The plan of operation as concieved is this—that if the cutters of gum,or birch, or of popular, or of walnut, or of mahogany, or of sawed quartered oak, deem it desirable from a costing or statistical standpoint to have a separate organization, they may do so, electing their own chairman or president as you may term him, which officer becomes automatically a vice-president of the parent body and a member of the executive committee of the parent body. This your committee thinks desirable, as the individual manufacturers of whatever groups may be formed are more acutely interested in the choice of their own executive than would be the entire body of cutters or manufacturers, and by automatically making this executive a vice-president of the parent body or the national association, each group is represented in the executive committee of the national association.

"The commissioner or secretary will function for the parent body as a whole and include in his duties such duties as the individual groups may require. His contract will be with the parent body or the national association and he will be paid by the national association. To provide the funds to carry out the above, assessments will be made: First, against the plywood manufacturing members; Second against the thin lumber manufacturing members; Third, against the associate members as provided for in the new by-laws.

In discussing the question of merging the two organizations, W. W. Knight, of the Long-Knight Lumber Co., Indianapolis, read a paper on "The Needs of Association Work in the Veneer and Plywood Industry." Mr. Knight discussed this subject under ten headings as follows:—"To Foster Trade," "Encourage Friendship," "Encourage High Standards," "Eliminate Evils of Ignorant Competition," "Preach the Doctrine of costs," "Handle Credits," "Do Legislative Work," "Promote Mutual Insurance," "Establish and Administer a Code of Ethics" and "Conduct Arbitration Proceedings."

It is anticipated that the added weight of the new organization will be instrumental in effecting reductions in the high freight rates under which the industry is laboring. The transportation problems are among the most serious with which the veneer and panel industry is confronted. At the present time the railways are charging unreasonably high rates for carrying veneers and panels. Under a recent ruling of the Railway Commission, the carriers were instructed to apply lumber rates, or rates closely related to lumber, to veneer and plywood. At the present time a cause is pending before the Interstate Commerce Commission, asking that the Commission issue an order directing the railways to put these lower rates into effect. It is hoped that eventually it will be possible to secure reductions which will run from 25 to 40%.

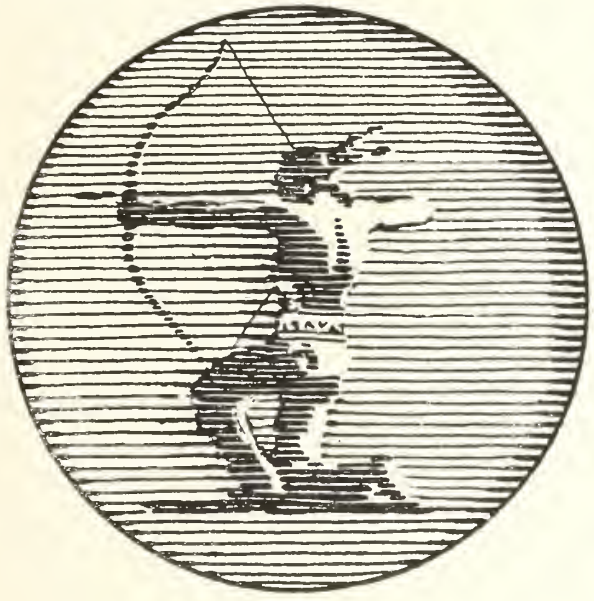
ALGOMA *the Better* Plywood



What does it mean when you see this trade-mark?

"Algoma"—of course—and "Better Plywood" will come to the mind of every man who has read our monthly message for the last year.

But what more does this trade-mark mean? Study it. The kneeling Indian is alert—he expresses readiness on our part to serve your needs with speedy promptness.

His bow, his arrow—these typify Plywood. They tell of lightness combined with strength—of accuracy, such as we maintain in everything we do.

More than this—the Indian symbolizes pioneering. And the spirit of Algoma, since 1886, has been above everything else a pioneering spirit—seeking out better ways of making Plywood, searching for new things which could be better made of Plywood—investigating, improving, perfecting—building a service in Plywood which is today more complete in every line than any other service in the United States.

Remember these things when you see this trade-mark. Remember them when you want Plywood. Bent work, extra large panels, stock panels, beautifully figured woods, the lastest importation of Circassian Walnut—you find them all at Algoma, and you can get them in Algoma, the Better Plywood.

ALGOMA PANEL COMPANY, *Algoma, Wis.*

Development of Waterproof Glue

Cannot be Called New Product—Many Examples of Wood Glued With Casein Found in Ancient Ruins—Prepared and Used Cold

By H. L. PRESTHOLDT*

Prior to the war, on this continent commercial waterproof glue was in the main unheard of. Almost simultaneously with the war a demand for waterproof glue developed. It was heralded as a new thing. Its merits were questioned to the utmost degree, and not until the United States Bureau of Standards had been so convinced as to set up standard specifications for waterproof glue to be used on government contracts did the glue enter the market as a competitive article.

But, casein waterproof glue is not really new like some of the things which science continues to discover from time to time. Its true age cannot be calculated. We know that a form of casein glue was used by the ancient Chinese, and it is not at all improbable that the very first glue known to humankind was an unscientific mixture of coagulated milk and alkali. The ancient Egyptians used the same combination for fixing together pieces of wood, particularly for enriching poorer grades of wood by surfacing them with a thin layer of fine veneer. The Greeks used the same principle. Thus, casein glue, formerly looked upon as an innovation, is really the re-establishing of a lost art.

Was Known to Ancients

We find, for example, that shipbuilders nowadays employ a covering of canvas or linoleum affixed with waterproof glue. This is virtually the same construction as was used by the great Roman Emperor, Trajan. One of his boats sunk in Lake Nemi, fifteen miles from Rome, in about the year 100 A.D. was recently discovered. Alberti V. says of it: "I found the timber in excellent preservation, which besides a coating of black pitch had a double covering of canvas glued on." Analysis of the glue proves it to be a casein product.

The Romans ruins have yielded many valuable examples of rare woods glued with casein glue. Such pieces of furniture embodying beautiful designs commanded fabulous prices, seventy-five thousand dollars being paid in one instance for a slab to be cut into surface veneers. Much of this furniture is practically intact today after many centuries.

Made From Ordinary Milk

The principal ingredient of casein glue is a milk product. Briefly, it is the dried curd of cow's milk. In some of the older countries of Europe it has long been the practice to mix fresh curd with lime and apply it immediately to the surfaces to be glued together, making a strong and waterproof glue joint. This simple formula is the pride of many an European cabinet-maker even today, coming down generation by generation from the medieval period. This by the way, is exemplary of the careful, patient workmanship exercised by medieval craftsmen, and accounts for the sturdy qualities of many of the massive carved and inlaid cathedral and castle chairs of Middle Europe, already centuries old, and good for many more.

This crude method cannot be practical to present day Commerce since the glue cannot be prepared at a central point and distributed for use by the consumer. We live in that advanced period of civilization when distance is measured in hours, not miles, and a consumer in any part of the world, one might say, expects to use the same materials as another consumer who is near a source of supply in another part of the world. Vast systems of transportation have enabled us to accomplish these very things.

Comes Ready for Mixing

So with glue it was necessary, in order to supply that powerful demand for commercial commodities, that the glue be rendered commercial. Scientists therefore, set themselves to the task of creating a commercial waterproof glue. Step by step they progressed, offering first several parts of the glue to be mixed by the consumer. The number of necessary operations and ingredients were gradually decreased until now we have casein waterproof glue in its perfection, a commodity which can be manufactured complete. It embodies many chemical ingredients scientifically prepared and proportioned. It is packed in barrels or other suitable containers, shipped to all parts of the world, stored and handled indefinitely. The glue is rendered fit for consumption by simply mixing the glue powder with cold water. There is nothing superfluous nor lacking, nothing intricate, nothing difficult.

Those who manufacture for export find it advisable that they use waterproof glue because it will pass through the humid tropics anaffected by heat, moisture and exposure, and without being attacked by those curious little red ants which eat the ordinary glue, leaving a veneered table leg, for example, like a loose, baggy trouser.

Finding Many Uses

It is interesting to note also the many articles on the market today depending directly upon waterproof glue. Untold quantities of waterproof plywood are being used and adopted for use in innumerable constructions such as automobile bodies, laminated frames and exterior doors and panel work. There is a host of special articles such as wood-disc wheels, plywood pulleys, friction heads, patterns in the various shops of custom builders, finished carved surfaces, wall board, operations for affixing wood to metal, hat blocks, toys, and in the shoe industry for gluing felt padding to leather. In a larger sense, casein waterproof glue can be used wherever any glue is used, which opens up that vast field of industries which only a keen imagination or a calculation of statistics could visualize. It has been pointed out that glue probably enters into the manufacture of more completed articles than any other single commodity. For, wherever we find wood it is likely we will find a dash of glue on it somewhere.

Furniture and panel manufacturers find that with very little additional equipment or perhaps only

Packing Should Receive More Attention

(Continued from page 80)

their shipments to be crated, that they would then crate them. Conferences with a considerable number of retailers bring out the fact that they now get from the carriers not over one-quarter of the actual damage to their goods and in addition have many dissatisfied customers. Frequently customers order goods which are not in stock, which the retailer then orders from the manufacturer. If they arrive in poor condition and must be refinished, the customer who knows the goods are to arrive at a certain time is dissatisfied with his purchase, because of the delay caused by the refinishing, and imagines all sorts of imperfections even though none exist. All those retailers to whom I spoke said that they would be willing to pay for better packing if all the retailers had to pay for it.

Should be Given Freight Preference

From investigations carried out to date it would appear that for a solid carload of furniture loaded by the shipper and unloaded by the consignee the separate pieces need not be packed nearly as well as for a less carload shipment of the same article, which has to be transferred several times, loaded with other freight and carted to and from the carrier. It is also thought that a shipment that is well crated according to a specification prepared from an engineering standpoint and designed to overcome the most frequent causes of damages to crated articles should be charged a lower rate than one that is merely protected, say with excelsior pads, or even burlap. Case Goods Manufacturer.

Development of Waterproof Glue

(Continued from page 94)

slight adjustment and alteration of the equipment they already have that waterproof glue may be adopted expediently. In so doing they have only one kind of glue to mix and handle. They have determined further that it takes very little time and labor to prepare waterproof glue because the preparation embodies simply measuring the glue powder and the water and mixing them with rapid agitation in a machine. Each batch requires only ten or fifteen minutes.

The retaining clamps may be removed and the material machined or allowed to dry naturally after two to four hours, thus giving access to clamps and caul boards to be used over again during the same day's production. Incidentally this permits the complete order to go through the mill without changing the saw and sandpaper set-ups.

HAY & CO., Limited Woodstock, Ont.

The Lumber Market

Domestic Woods

The demand for Canadian hardwoods is showing a gratifying improvement. One lumber wholesaler recently intimated that he did not have any complaint to make as far as volume was concerned but that he was not satisfied with present price levels as the business being done continued to show a loss. It is hard to determine just what to-day's prices are, the spread or variation running in some cases as high as $25.00, depending largely on how badly the seller needs the business and how persistent the buyer is in his efforts to force lower quotations. Buying on the part of the automobile manufacturer is about over. The lumber this industry has purchased, together with the stock carried over from last year, should last until well on into the summer. Furniture manufacturers and other users of local hardwoods have entered the market in larger numbers and are displaying an increasing willingness to buy. This is due in part, at least, to a realization of the fact that the probability of lower prices is very remote and to the possibility that values may stiffen. Some stocks are in weaker hands and are from time to time being offered at various concessions. This has a demoralizing effect on the whole market, and is one factor which is tending to prevent a return of confidence which means buying on a larger scale. The impression seems prevalent that these stocks will be pretty well cleaned up during the next few months and that when this is an accomplished fact, the tendency will be toward slightly higher prices. One wholesaler remarked that he noticed a broadening out in the demand for hardwoods. This means that other industries are coming into the market and may tend to increase prices. There are few, if any, indications pointing toward lower values but every promise that quotations will go higher.

Imported Woods

It is difficult to form a clear idea of conditions in the various American producing centres as there is, apparently, a conflict of opinion. Some reports received indicate a marked improvement in demand with a tendency toward firm, if not higher, prices, while other reports point to a continuation of the present quietness and to price recessions by manufacturers who are anxious to make sales. In the southern areas weather conditions are such that lumbering and logging is almost at a standstill. In some localities it is predicted that active producing operations cannot be undertaken for from 60 to 90 days. All this cannot fail but have an effect on the market as it tends to prevent an accumulation of stock. It has already had the effect of bringing many heavy hardwood users, such as flooring manufacturers, into the market in an effort to cover their requirements for some months to come. Prices are, on the whole, firm though some stocks have been sold at slight sacrifices. Any wood users who are in need of stock or who will require lumber during the next month or two, would be well advised to book their requirements now for if they put off buying, it is doutful if they will not be forced to pay slightly higher prices when they enter the market.

Memphis, Tenn. As a result of interference with production due to weather and flood conditions, the consuming interests have shown a greater anxiety to place orders. This is evidenced by the fact that several orders were placed recently, calling for deliveries over a period of three or four months. While this was a feature of the market some years ago, the practice has not been in evidence during recent months. Where business is booked for future delivery, the lumber manufacturers are insisting upon prices prevailing at the time of shipment as they are thoroughly convinced that the next few months cannot fail but show enhanced values. There is a much better tone reported in the Memphis market with more buyers, a larger volume of business being done and prices holding form.

Louisville, Ky. The hardwood trade in this district is badly handicapped by flood conditions which are prevalent in the South. Shipping is difficult because of conditions imposed by the high water. Many of the streams and rivers reach such high levels that not only were the mills nuable to secure the logs necessary to maintain production but were, in many instances, forced to close down entirely. Recent quotations, f.o.b. Louisville, are as follows:— Plain FAS inch oak, $110; common, $55; quartered oak, $140 and $70; poplar, $110; saps and selects, $80; common $50; quartered red gum, $115 and $70; plain red gum, $100 and $62.50; sap gum, $45 and $31; walnut, $250; selects, $175; common, $105.

Evansville, Ind. The report from this district indicates an increased activity with prices on certain grades showing an upward tendency. Gum is in strong demand, the furniture industry being the chief buyer in the field. The call for oak is also showing surprising strength.

Carborundum Appoint Dist. Sales Manager

W. W. Sanderson, General Sales Manager of The Carborundum Company, Niagara Falls, N. Y., announces the appointment of Harry Fowler as District Sales Manager of the Cincinnati territory of the Carborundum Company to succeed Charles R. Cox. The appointment of Mr. Fowler is effective July 1st. Mr. Fowler will take charge of the Cincinnati District. Mr. Cox will be transferred to the main office of The Carborundum Company at Niagara Falls, N. Y., where he will take up his new duties on sales statistics.

Advertising is a Locomotive

William Wrigley, Jr., is spending $10,000 a day, over three and one-half million dollars a year, for advertising his popular brand of chewing gum. To a friend who remonstrated, saying his product being so well and widely known did not need such enormous outlay of money for further advertising, Mr. Wrigley said: "My friend, we're riding on a train. What would happen to this car if the locomotive were disconnected and went on ahead? Well, that's what would happen to my business if I stopped advertising."

Many a mill man can have the most honest staff in the world, yet be robbed daily by poor bearings, tight belts, badly sharpened saws and indifferent machines.

Suggestions of Live Current Items

The usual famous Anderson-Tully service stands behind every foot of the following list of specials which we are pleased to offer the buying trade:

QUARTERED WHITE OAK

4/4 FAS 150,000

Full product of the log in this grade. Stock containing all of the 10" and wider produced, average 7½" for width, 45% to 55% 14' and 16' lengths.

4/4 No. 1 Com. & Selects .....150,000'

Full product of the log in this grade. 45% to 55% 14' and 16' lengths. Stock 8 to 12 months dry.

QUARTERED SYCAMORE

6/4 No. 1 Com. & Bet ..... 75,000'
5/4 No. 1 Com. & Bet. ..... 40,000'

Sycamore is beautifully figured stock, band sawn and equalized, 7 to 8 months dry. 55% to 60% 14' and 16' lengths. All wide in this stock.

News of the Trade

The woodenware factory of Thomas Moore, Rodney, Ont., was slightly damaged by fire recently.

D. S. Cluff, Port Elgin, Ont., is negotiating for a building in which to establish a general woodworking plant.

Lindsay Rattan Co., 191 Adelaide St. W., Toronto, was recently registered with Wm. H. Lindsay as proprietor.

Wilfrid Chicoine, Rigaud, P. Q., contemplates erecting a two-storey sash and door factory, 30 x 35 feet.

J. E. Fraser & Co., Pembroke, Ont., makers of musical instruments, recently suffered a loss by fire.

Wm. Pratt, secretary of the Petrolia Wagon Works, died recently at his home in Petrolia, Ont.

Ed. Vechert recently opened up a cabinet shop at Weston, Ont. He has found business very good and expects to extend his activities in the near future.

Messrs. Lemon & Gonason, Victoria, B. C., were the successful tenderers for the millwork for the new high school which is being erected at Salmon Arm, B. C.

Wm. Townsend, aged 87, died at the home of his son in Toronto. The deceased for many years conducted a cabinet and upholstery business.

The Vetcraft Toy Workshop, 160-164 Dupont St., Toronto recently suffered a fire loss of about $35,000. About 90 men are temporarily thrown out of work.

Gigaire & Plant, Shawinigan Falls, P.Q., manufacturers of sash, door and general woodwork, have added a 42-inch C.M.C. band resaw to their equipment.

The Ross Boat & Canoe Co., Orillia, Ont., recently opened an up-town showroom where they are making a display of their complete line.

Morin & Frere, Cap de la Madeleine, P. Q., have commenced work on a small planing mill. The building is to be one storey 30 x 40 feet.

A. & E Belanger, Valleyfield, P. Q., are remodelling a factory for the purpose of manufacturing sash, doors and general woodwork. Some equipment will be required.

Myers & Co. of Valparaiso, California, are reported to have taken a five-year lease on a floor of 118 Sherbourne St., Toronto Ont., and will manufacture desks and furniture.

A new clothes pin factory was recently put into operation at Nelson, B. C. The new mill cost $20,000.00, employs 20 people, and will use 120,000 feet B.M. of birch each year.

A. R. McDiarmid, Limited, Brandon, Man., has been awarded the millwork contract for the new $300,000. building erected in Winnipeg by the Great West Life Assurance Co.

It is reported that Cooper & Moore, Buffalo, N. Y., makers of billiard tables have leased premises at 192 Terauley St., Toronto, and will undertake the manufacture of billiard tables.

George Valentine vice-president of the Massey-Harris Co., Toronto, has been appointed president of the Bain Wagon Co., Woodstock, Ont., which is controlled by the Massey-Harris Co.

Brown & Rutherford, Winnipeg, Man., have been awarded the woodworking contract for the new $55,000 office building which is being erected by the Northern Life Assurance Co.

W. E. Phillips Company, Limited, Oshawa, Ont., have been incorporated with a capital of $150,000 to manufacture mouldings, frames, furniture and other wooden articles Two of the incorporators are W. E. Phillips and R. S. McLaughlin, both of Oshawa.

The plant of the Frame & Door Co., Mount Dennis, Ont., was completely destroyed by fire recently. This factory had only been in operation one week when the blaze occurred.

The contract for the millwork for 34 residences being erected at Mount Royal, P.Q., by the Rockland Housing Co., Montreal, has been awarded to M. Desjardin & Fils, Terrbonne, P.Q.

The Cranbrook Sash & Door Co., Cranbroock, B. C., is shipping lumber and dimension at the rate of 15 cars per week. The greater part of this is going to the big irrigation projects at Kipp, Alberta.

The Fletcher Lumber Co., Windsor, Ont., have commenced work on a planing mill and general office. The planing mill is to be one-storey 30 x 50 while the office building is to be 24 x 24.

Unique Rims, Limited, Toronto, have been incorporated to manufacture and deal in automobile wheels and rims. Capital $500,000. J. Newman and H. McGladdery, barristers, both of Toronto, are two of the incorporators.

Andrew Henderson, who operates a planing mill at Cheltenham, Ont., was badly burned recently in an attempt to check a blaze which started in his plant. The damage to machinery and stock amounted to $5,000.

The H. & E. Furniture Co., Limited, of Milverton, Ont., manufacturers of kitchen cabinets and cedar chests, recently installed a Dodds 20-spindle combination dovetailer, purchased through the A. R. Williams Machinery Co. of Toronto.

Exhibits of work done by night students at the Windsor Collegiate, Windsor, Ont., were recently viewed by hundreds of people. Among the many displays the cabinet making section was especially interesting and included floor lamps, hope chests, rocking chairs, wooden bedsteads and many other articles.

"The Phillips Line"
Window Frame Machines

This is the work ☞

Let us tell you about the machine.

Testimonials from hundreds of satisfied users.

F. V. Phillips invented and built window frame machines for 40 years. "The Phillips Line" is the culmination of his efforts.

We also solicit your inquiries on Hardwoods, Cypress, Cypress Lath and Shingles. We have a good assortment and suggest that you buy now for your Spring requirements. We can ship mixed cars in thicknesses from 3/8 to 12/4".

It is understood that our stocks are constantly changing by reason of manufacture and shipment. We are prepared to surface one or two sides.

Sole Manufacturers PANTHER BURN Cypress

The capital stock of the Hope Mfg. Co., Limited, 456 Gilbert St., Toronto, Ont., has been increased from $40,000. to $100,000. The company are large manufacturers of doors and other lines.

Priscilla Limited, Toronto, were recently incorporated to manufacture and deal in washing machines, wringers and laundry appliances of all kinds; capital $40,000. J. W. Broudy and T. H. Wilson, barristers, both of Toronto, are two of the incorporators.

Strain & Emery, Limited, Windsor, Ont., were recently incorporated to operate a planing mill and to manufacture and deal in all kinds of wood products. Capital $40,000.00. Two of the incorporators are G. H. Emery and J. W. Strain, contractors, both of Windsor, Ont.

Woodstock Pipe Organ Builders, Limited, Woodstock, Ont., have been incorporated to manufacture and market pipe organs and other musical instruments. Capital $40,000. Two of the incorporators are Charles Bond and H. A. Karn, both of Woodstock, Ont.

The Pacific Box Company, Vancouver, B. C., began extensive repairs the first of this month. The work consists of repairs to flooring and reinforcing foundations of mill, also driving a number of creosoted piles at the end of the mill fronting on False Creek.

Hamilton Iceless Refrigerator Co., Ltd., Hamilton, Ont., have been granted a provincial charter to manufacture and deal in refrigerators, cabinets and kitchen furniture. Capital $50,000. John Pentland, and David Horne, both of Hamilton, are two of the incorporators.

The Breece Mfg. Co., Portsmouth, Ohio, have instituted proceedings against the Aetna Casualty & Surety Co. of Connecticut, for $25,000. This is to indemnify the Breece Company for settlement and costs in the suit brought against them by the Perkins Glue Co.

Woodworking plants in New York State, particularly in the vicinity of New York City, report that the radio telephone craze is bringing them a great amount of business in supplying parts, such as spools or reels for making coils, and wooden cabinets.

The Seventh Annual Convention of the Associated Cooperage Industries of America is to be held at St. Louis, Mo., May 4th and 5th. It is anticipated that a large number of those interested in the cooperage industry, from both Canada and the United States, will be in attendence.

The Cranbrook Sash & Door Coy.'s mill at Kitchener, B. C., is now running with about sixty men, and cars are being shipped in considerable numbers both to this point and to Southern Alberta, where lumber is being supplied on a big irrigation contract.

Young-Canada Products Limited, St. James, Man., were recently granted a provincial charter to manufacture and deal in sash, doors, toys, furniture and other wood products. Capital $20,000. Richard Power, St. James and C. L. Richardson, barrister, Winnipeg, are among the incorporators.

Mr. Ramsay of the J. D. Wallace Co., Chicago, Ill., manufacturers of portable woodworking equipment, was in Toronto recently in an endeavor to size up the Canadian field. This company is considering the advisability of appointing Canadian representatives and making a strong bid for Canadian business.

B. C. Howard & Co., Ltd., Sherbrooke, Que., have been granted a provincial charter to take over the business of B. C. Howard & Co., and to manufacture and market sash and doors, boxes and other wood products. Capital $599,000. Two of the incorporators are B. C. Howard and C. B. Howard, both of Sherbrooke.

Frank Sweeney who is connected with the cooperage industry in Victoria, B. C., recently returned from a business trip in Eastern Canada and the United States. Mr. Sweeney has been strongly advocating the use of B. C. Douglas fir for barrels, maintaining it to be an ideal wood for the purpose.

W. E. Phillips, Limited, Oshawa, Ont., have awarded the contract for their new factory which is to be erected at a cost of $25,000. Mention was made of this project in the March "Canadian Woodworker." The lines to be manufactured include mouldings, mirrors, woodwork of various kinds, etc.

The Myers Lumber & Mfg. Co., 15 Toronto St., Toronto, have commenced work on their plant at Spadina Road and Eglinton Ave., North Toronto. The buildings being erected consist of a two-storey planing mill 70 x 80 feet, one-storey office, 28 x 34 feet, 2-storey stable 34 x 28 feet, boiler house and two-compartment dry kiln.

G. Russell Carrick, Crystal Beach, Ont., has purchased the Crystal Beach planing mill and lumber yard from J. T. James. This business will be carried on under the management of C. H. Haun. In all probability a few changes and improvements will be made, including the installation of a 60 H.P. electric motor. Mr. Haun reports that business is extremely good in the Crystal Beach district.

The plant of the Port Hope Lumber & Veneer Co., Port Hope, Ont., is working to capacity on fruit baskets. It is anticipated that over 1,000,000 will be turned out this season, which is double the output of last year. At the present time 40 hands are employed, many of them working overtime. One of the most efficient basket makers is averaging 70 baskets per hour.

A charter has been granted to the Myers Lumber & Mfg. Co., Toronto, with a capital stock of $200,000. Among the incorporators of the company are William James Myers, lumber merchant, William Warren, manager, Thomas E. Crow and others. The head office of the company is at 15Toronto St., and a yard and factory have been opened up at corner Spadina Road & Eglinton Ave.

In order to secure additional capital to increase the capacity of the present plant, which is in operation at Milner, the Murrayville Toy Company has been reorganized as a limited company, and will in future be known as the Milner Toy Manufacturing Company, Limited. The officers of the new concern are:—President, Q. A. Gosling, Murrayville; vice-president, W. S. Udy, Milner; secretary-treasurer, A. F. Hale, Langley Prairie.

Chestnut Canoe Co., Limited, Fredericton, N. B., have awarded a contract for their new factory building to replace the one destroyed by fire last year. The new plant will have a total floor space of some 40,000 square feet and it is claimed will be the largest canoe manufacturing plant in the British Empire. At the present time the company is operating a temporary plant at full capacity to take care of their many customers.

A provincial charter has been granted the Toronto Hardwood Lumber Co., with headquarters in Toronto and a capital stock of $40,000. The new organization is an associate one of the Toronto Veneer Co., 1104 Queen St. West, and among the incorporators are,—Joseph A. Houde, Wm. A. Dugit, Herbert T. Brewitt, W. R. Jones and Ernest Houde, all of whom are associated with the Toronto Veneer Co. The Toronto Hardwood Lumber Co. will handle all kinds of hardwoods, both foreign and domestic, and is engaging in the business both in a wholesale and retail way. The yards are at the corner of Atlantic Ave. and the G. T. R.

Look for the brand—It's on every board

THE KRAETZER-CURED LUMBER CO.

Your Protection—Our Guarantee

Kraetzer Curing—What It Is

Kraetzer Curing is simply the modern and more efficient application of the treatment of wood relied upon by the artisans of the earlier periods in the construction of their master pieces of cabinet work. Even, now, after the elapse of centuries, we still frequently encounter such pieces in a perfect state of perservation.

This treatment is even more beneficial to Gumwood than to the woods employed in those earlier times. Kraetzer Curing immediately eliminates the sap and gelatinous substance in the wood. It also completely does away with fermentation and the resulting strain and decomposition, which by some is considered a necessary and deterring evil.

Likewise, Kraetzer Curing makes the sap portion of the wood more dependable than the Heart or Red Wood. It can then be used for practically all purposes with equal or greater satisfaction than Red (or Heart) Gum, Birch, Maple or other woods. It is available at materially lower prices.

Send for the Kraetzer-Cured Booklet, and write or wire for quotations.

The Kraetzer-Cured Lumber Co

Kiln Drying Facts for Executives

(Continued from Page 59)

in the lumber to retain it in near balance with average atmospheric E. M. C. (equilibrium moisture content) conditions, (commonly 5% moisture although not necessarily correct) the total shrinkage by volume in the perfectly dried board, would be 4/5 of 10% or 8%.

From the shrinkage table it will be seen that Tennessee chestnut for example, shrinks 3.4% radially and 6.8% tangentially or plain and quartered sawn, respectively. As only 4/5 of the total shrinkage would occur in reducing the moisture content to the proper point this would leave 2.72% in the radial direction and 5.44% in the tangential direction. It is therefore obviously impossible to save the same amount in thickness as in width, because whatever the shrinkage in the radial (or plain sawn) direction, it would be approximately twice the amount in the tangential or quarter sawn direction, and the shrinkage to the correct moisture content would be only 8.18%, **none of which could be reduced without injury to the lumber.** It is a fact, well known to those who have made a study of the subject, that the best possible drying practice, unfortunately produces the greatest amount of shrinkage.

There is one certain way of reducing the per cent of shrinkage on the outer dimensions of the boards and that is—case-hardening. In this case the outer surfaces are reduced to a dry state too rapidly, moisture transfusion from the inner fibres does not keep pace with the rate of moisture evaporation from the surfaces and consequently the outer surfaces set rigidly.

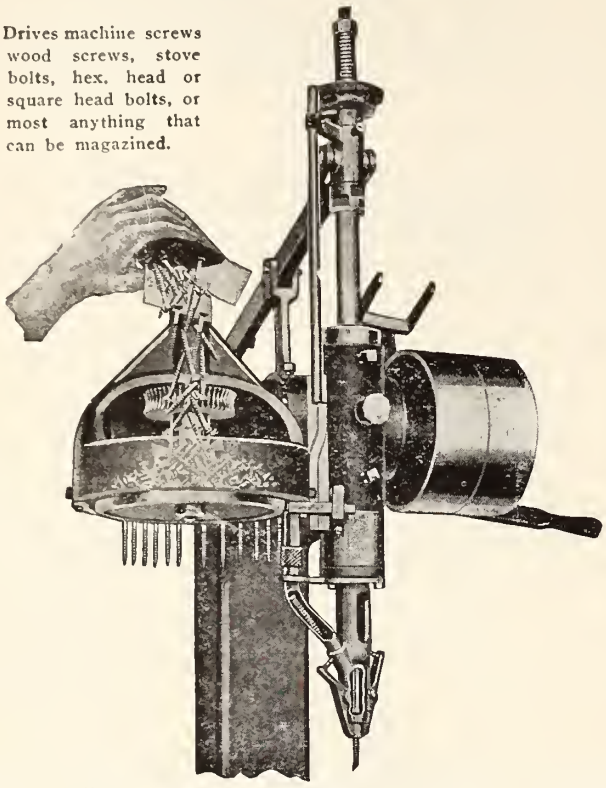
The Demand is for Lower Prices!

Drives machine screws wood screws, stove bolts, hex. head or square head bolts, or most anything that can be magazined.



Reynolds Automatic Screw Driving Machinery will help you meet the demand

Everywhere the manufacturer is faced with the problem of price reduction. How can he find the solution?

By cutting out every waste—of time, labor materials, etc.

Many manufacturers have installed Reynolds Screw Driving Machinery for this reason. It accomplishes the work better in one-third of the time.

Consequently they are able to meet the demand for lower prices and hasten the return to normal buying.

Are you interested? Then write us to-day for the full facts.

Send us dimensions over all of your work and gauge and length of screws driven so that we can determine the proper size and type machine to meet your requirements.

SIMONDS
CIRCULAR AND BAND
SAWS

In every mill or woodworking shop in the land the demand for greater production is urgent. Devious methods to secure the desired results are being tried out. Some are making good—some are not. They have the manpower, but they can't get production. Many mills and woodworking shops have discovered one of the greatest hindrances to efficient operation are poor saws and knives. The saws dull easily and do not hold their tension, while the knives lose their cutting-edge quickly and this results in unsightly marks on the lumber, and consequently damage.

Inferior saws and knives are being discarded by many, and in most cases Simonds Products are replacing them. There is no question about Simonds Saws and Knives They are made of the finest steel obtainable, hardened and tempered right and make mechanically perfect. They produce smooth lumber and cut down your operating expense.

Write for catalog and prices.

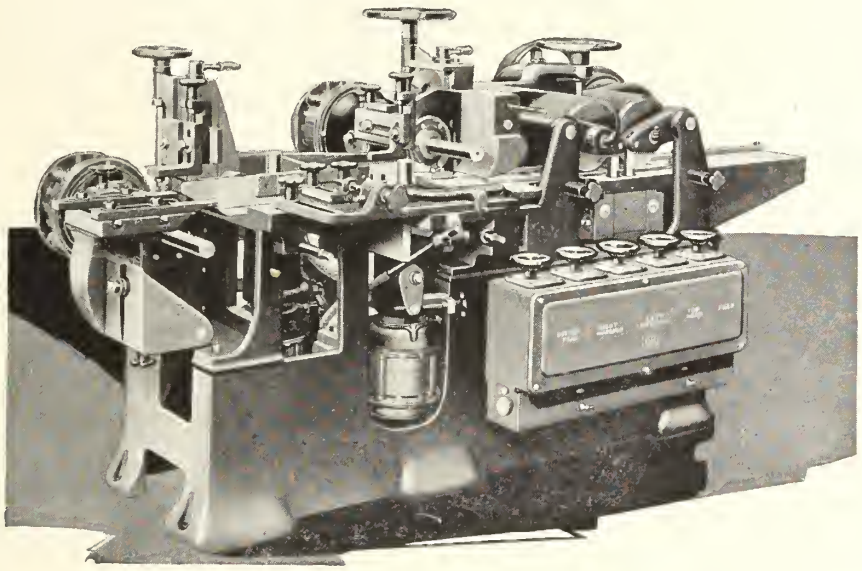
SKF



Perfect Spindle Alignment at High Speed

One of the greatest of moulder troubles is pounding and whipping of belts travelling at a speed of more than a mile a minute. On the above machine such troubles are entirely eliminated by substituting individual motor drive in place of belts and **SKF** marked self-aligning ball bearings in place of ordinary babbitt bearings. This combination eliminates the pound and slap which quickly destroy ordinary bearings; it provides also bearings which automatically compensate for any possible misalignment or deflection in the spindles.

SKF marked self-aligning ball bearings in any kind of woodworking machinery minimize friction and wear; they decrease vibration and keep moving parts in proper relation to each other, thereby insuring greater production and a better quality of work.

LOOK IN THE SCRAP BOX

THERE is much to be learned by looking in the scrap box in any sanding room.

If it is filled with half worn paper or cloth that has dulled too quickly—if it is loaded with scrapped, partly-used belts or paper that has split and peeled long before doing full duty on the machines—then your scrap box is telling you a story of excessive waste—a story of soaring sanding costs.

Carborundum Brand Garnet Paper and Cloth Products because of the unquestioned strength and flexibility of backing—because they are uniformly coated with clean, hard, sharp, North River Garnet—because they hold their grain and produce more work reduce such waste to a minimum.

CARBORUNDUM BRAND GARNET PRODUCTS

OVERTON K.D. BENCH

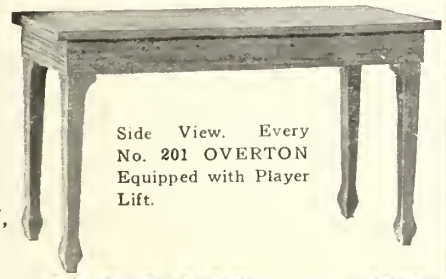
No. 201

A high grade popular priced bench which is shipped K.D. only, is easily set up, and permanently rigid.

The 4 legs are shipped carefully packed in music compartment. A saving of one-quarter in size of package; 15 pounds in weight; and about 30% in freight; with no danger of damage in transit.

Assembled in less than two minutes with a screw driver. Our patented corner bolt construction makes a solidly rigid bench.

Beautifully finished to match the finest instrument. Write for our new catalog and color chart.



Side View. Every No. 201 OVERTON Equipped with Player Lift.

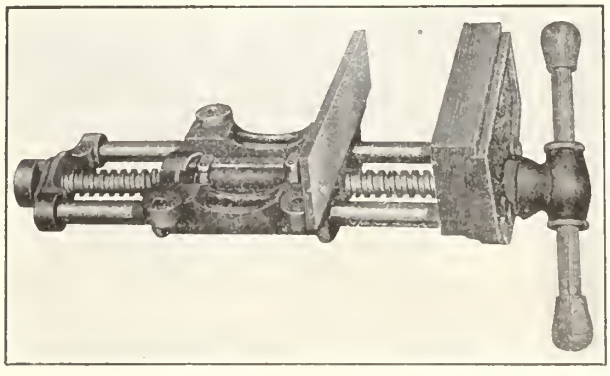
The Vise You Swear BY not AT



On the Market for 15 years.

Globe Vise & Truck Co.

GRAND RAPIDS, MICH.

We also manufacture a complete line of steel trucks particularly for wood working factories. The body of our truck is absolutely indestructible, and there are no nails nor screws in the top to mar material, whether finished or unfinished. The roller bearing feature in the wheels allows for much easier handling than the old style plain wheels on the wood truck. In fact one man can handle much more material than on the old style. The price is very little more than that of the old style wood trucks.

Efficient, economical, smokeless Firing—

The burning of refuse is an old story with woodworking establishments but the awakening to the possibilities of improved systems of using this new valuable fuel through the

NATIONAL
Hand Fired Stokers

is something new. It offers semi-automatic stoking which gives results with cheap help that an experienced fireman can only get—sometimes. Better boiler capacity and thorough combustion of any type of fuel is ensured. Let us send you full particulars.

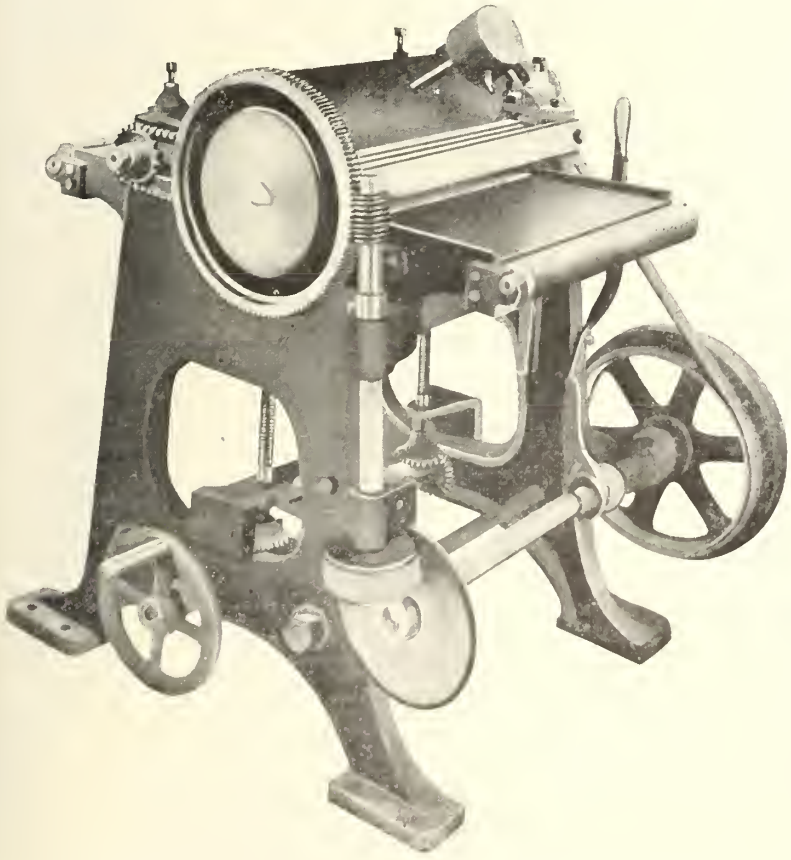
Morgan Machine Co.
Rochester, N. Y.



The Elliot Bull Dog Planer

6″ x 16″

The facts that the head is run by a worm gear; no pinions on the head and that the feed rolls are driven independent of the head excludes vibration. Hence—it planes smoother than any other Pony Planer made. Also it uses less power.

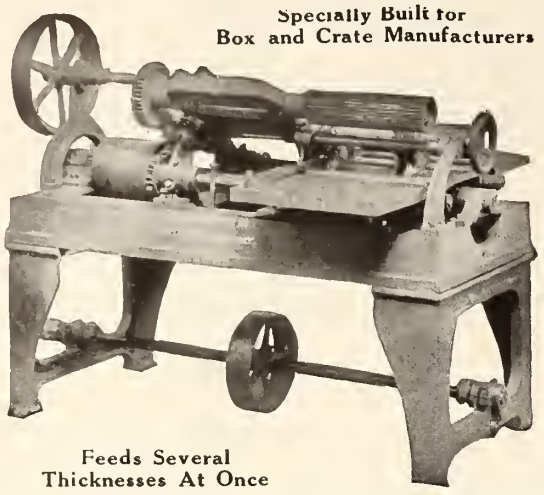
"The Chattanooga" — Just Another Name For Fast, Economical Gang Ripsawing

Specially Built for Box and Crate Manufacturers



Feeds Several Thicknesses At Once

This latest improved gang ripsaw is powerful, fast, safe and eliminates wastage. For gang sawing boards into strips or head sticks and for ripping veneers it is unsurpassed.

Has powerful feed and securely holds down and feeds short pieces. The feed rolls are automatically adjustable to varying thicknesses. Upper rolls are driven by cut gears, and the lower ones by sprocket chain. Several thicknesses of veneering can be fed thru machine at one time.

The CHATTANOOGA is an unusually big producer, easily operated, and turns to profitable account short stuff lying around a mill—otherwise wasted.

Attractive price. Complete information on request

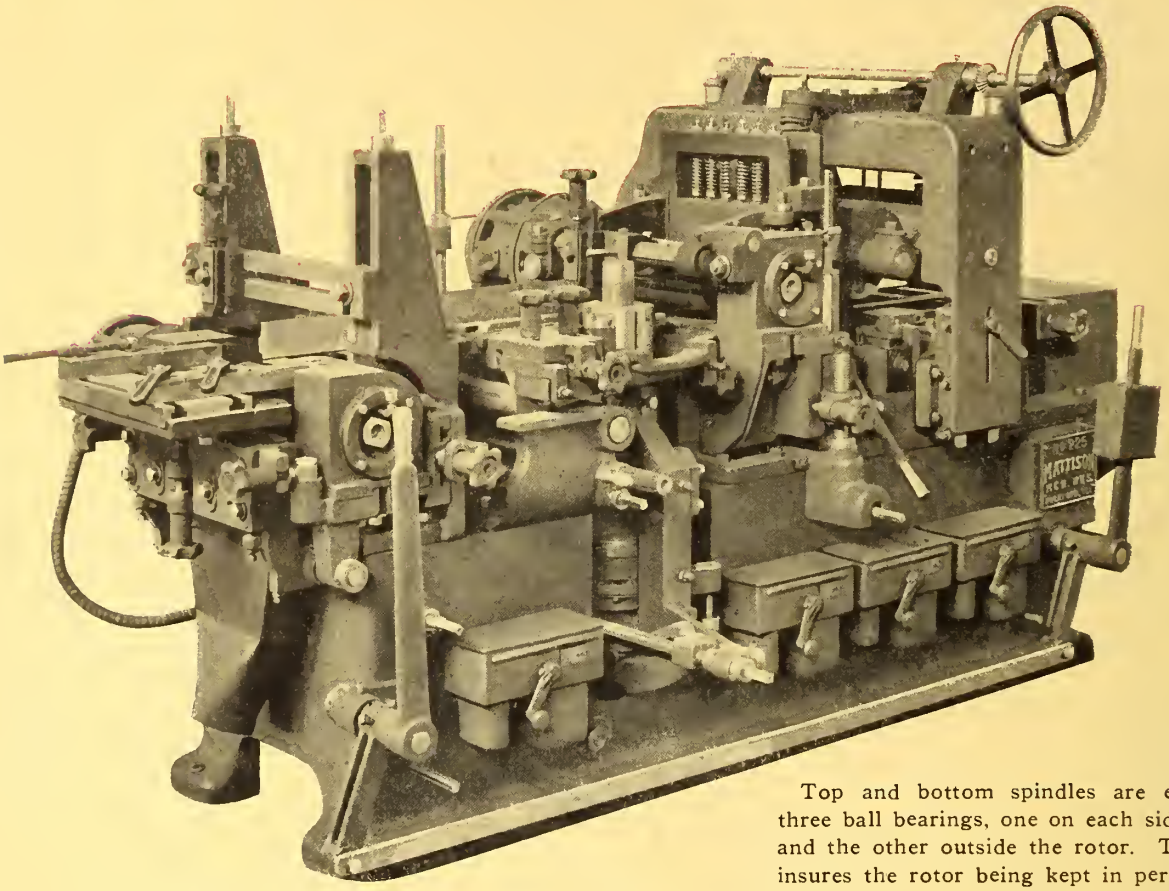
Canadian Blower & Forge Co.

KITCHENER, ONT.

Production Demands the Electric Moulder



Top and bottom spindles are each provided with three ball bearings, one on each side of the cutterhead and the other outside the rotor. This outside bearing insures the rotor being kept in perfect alignment with inside walls of field coils.

TEN years ago, when a man bought the latest and most efficient type of moulder, it was a belt-driven machine. Yet, it was the best he could get.

But today, even if he selects the most efficient and up-to-date type of belt-driven moulder, he is still getting a machine that is already out-of-date. For the advent of the Motor-Driven Moulder marks the opening of a new era in moulder construction; and from now on the motor-driven type will, without a doubt, gradually replace the belt-driven moulder in all modern plants.

The Mattison Electric Moulder, with its powerful, individually controlled motors for each head and the feed works; with its removable outside bearing, and accessibility for quick set-ups, marks a wonderful advancement in moulder construction.

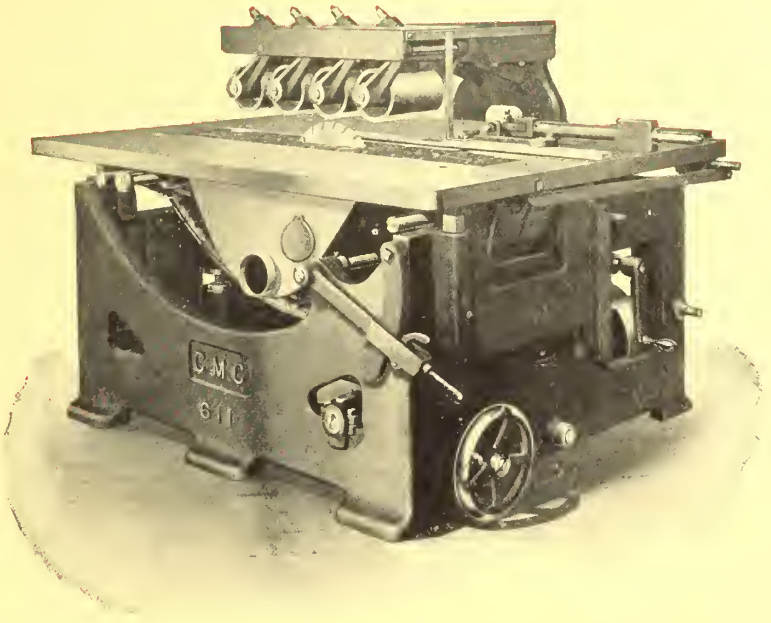
No. 611 Straight Edging
and
Jointing Saw
with
Ball Bearings
and
Sectional Rolls



When we put our No. 611 Straight Edging and Ripping saw on the market. we gave the woodworking trade the best machine of this type which had been offered them, and it is generally recognized that the "611" is still without an equal.

It has been suggested to us by some users that this machine might be improved by using sectional feed rolls for feeding uneven stock, and equipping it with ball bearings to reduce power consumption. We are pleased, therefore, to draw the attention of our many friends to our No. 611 Straight Edging and Jointing Saw with these latest improvements.

Quiet Gears

Why Tolerate Noise?

Use our efficient and durable Celeron or Rawhide Pinions

Gear Data for Your Note Book

Cut This Out—More Coming Later

SILENT PINIONS

From The Hamilton Gear & Machine Co., Toronto

NON-METALLIC PINIONS should be used wherever noisy gears would be objectionable. When well made they are really quiet. They have about the same strength as cast iron at slow speeds, and at high speeds they will carry more load than cast iron on account of their elasticity and smooth running. Rawhide will not stand oil or water. For such service use a pinion made in the same manner, but with CELERON instead of hide.

For best service and quietness make the face wide enough so that the metal mate does not touch the flanges of the pinion. When used on a motor add to the face the amount of the end play on the motor. Do not drive rawhide pinions by a set screw in one hub. Use preferably a key to distribute the load to both flanges and put less strain on the rivets. Flanges should always be made the full outside diameter of the pinion. Red brass is the most suitable material.

We carry a good stock of both celeron and rawhide of superior quality and can make very quick delivery on pinions, especially standard styles without hubs.

Remember—Our Non-Metallic Pinions are Quiet and Serviceable. We make the best quality and quickest delivery.

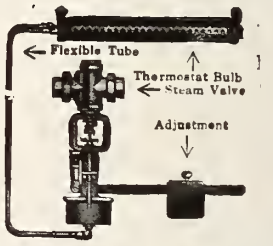
You Don't Guess Time! Why Guess Temperature?

In the glue kettle, the varnish drying room, the dry kiln—wherever there is a need for maintaining a definite, even temperature, the Powers Automatic Heat regulators give "100 per cent perfect" results. They are always on the job—accurate, sure, reliable. They prevent overheated glue, checked or case-hardened lumber, crazed varnish—all the errors that are so apt to creep in with manual control.



The Powers Regulator No. 15

Entirely self-contained. Peculiarly adapted for control of drying room, kiln, etc.
Other Powers Regulators for other places. Ask for details.

We shall be glad to give you the benefit of our more than thirty years experience in temperature regulation, and if you will tell us where you would like to try out a Powers Regulator, we will send the right one for thirty days' trial. If you don't find it satisfactory, send it back.

Do you know that we make the smaller woodworking machines as well as the big ones?

We're not going to tell you about any particular machine, we want to have a little talk with you.

Are you one of those fellows when thinking of woodworking machines, say to yourself, there's Yates in Hamilton, but their machines are too big for me, I only want a small machine.

Get that idea out of your head about us building the big machines only, we certainly do and sell lots of them, but, we also build the smaller ones, and they are certainly built good too, any user of our machines will tell you so.

The next time you are thinking of making additions or changes in your plant, and you want information on any kind of woodworking machines, keep us in mind drop us a line, we'll gladly give you the benefit of any information we may have.

Yours very truly.

The "Merit" Three-Plate Veneer Re-Drier

has two openings only and is designed for plants having need of a re-drier of moderate cost and of limited capacity.

The machine is electrically driven and is piped for connection with the factory steam line.

A vertical movement of the middle plate gives the veneer pressure first in one opening and then in the other and provides the well-kown "Breathing Movement" peculiar to Merit Re-Driers.

MERRITT ENGINEERING & SALES COMPANY
Lockport, N. Y.

MESCO

The "Merit"
Re-Drier
FOR VENEER

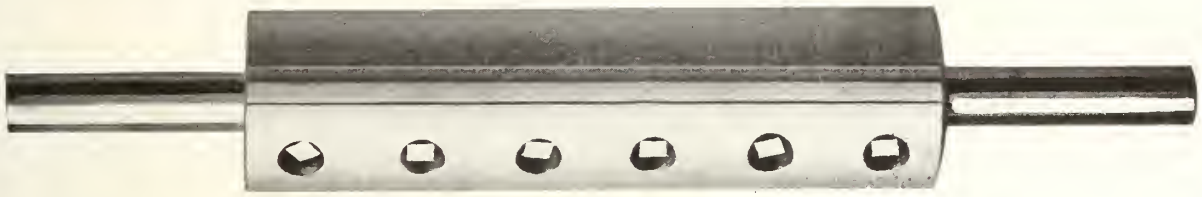
INSURE your veneer work against surface checks, hair lines, blisters, warping and glue failure by installing a "Merit" Re-drier.

Thoroughly dry and flat veneer avoids these troubles, gives tight joints and saves glue.

No system of air drying will accomplish this result. Hot Plates with "breathing movement" are the thing.

MERIT

The Shimer Round Safety Cylinderwith High Speed Knives



A Round Safety Cylinder that will Appeal to the Buyer and the User for three Reasons:

The first is our adjusting nut for setting the knives. It is the only cylinder with properly located adjusting nuts for setting the knives, which, with our way, can be set to 1-1000 of an inch.

The second is our way of holding the knife without tapping into the head.

The third is the correct angle of cut for the knives.

Made for Any of the Different Makers' Machines and in Any Length Cylinder.

What Time do You Require to Dry Two Inch Birch?

One of the largest Auto-body manufacturers in Canada is drying two inch Birch in an average of ten to eleven days, with its battery of NATIONAL AUTOMATIC HUMIDITY CONTROLLED DRY KILNS.

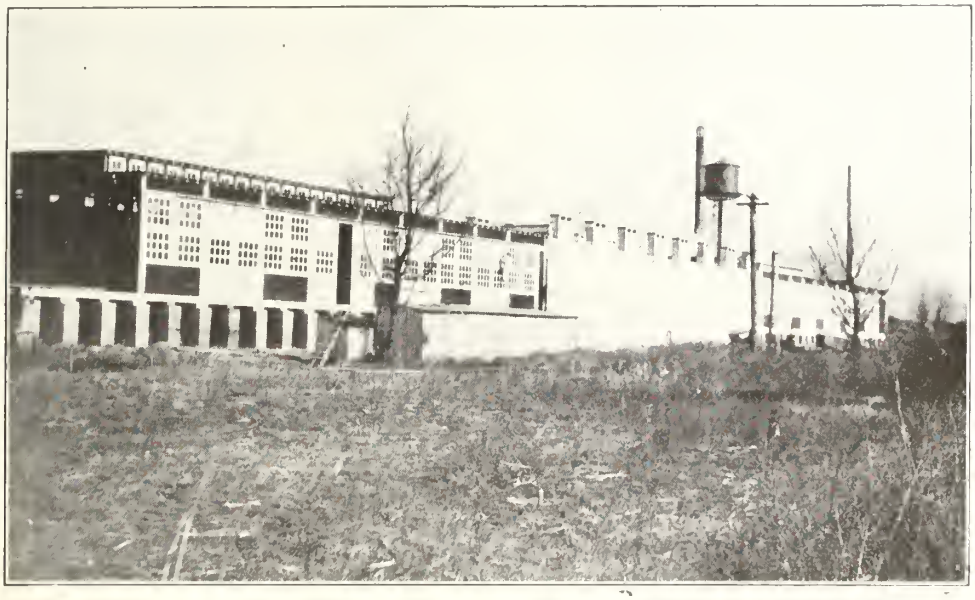
You say, "How can this be accomplished?"—for you probably have been contented in drying two inch Birch (six months air-dried) in from two to three weeks.

The Four Necessary Elements in the Drying Process are:

HEAT: HUMIDITY: VENTILATION: CIRCULATION:

In the NATIONAL AUTOMATIC HUMIDITY CONTROLLED KILN each of these elements is

Ample in Quantity, Flexible in Arrangement, Uniform in Distribution, Absolutely Under Control.



WHY BE HANDICAPPED? The best investment you can make is in an installation of a NATIONAL KILN. Let us figure with you on a new kiln or the remodeling of your present equipment. Write us full details to-day.

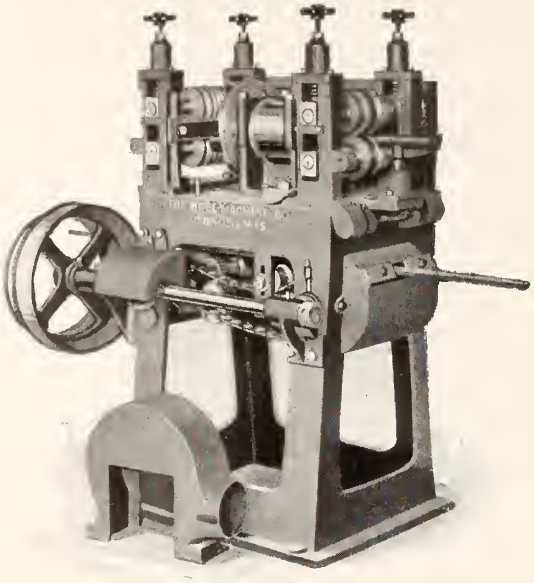
NATIONAL DRY KILNS

"The First Kiln in 6,000 Years in Which Humidity is Automatically Controlled."

Make Your Own Dowels With the "BELL" Machines

The Fastest and Most Practical Equipment For the Purpose



Adjustable Rod and Dowel Machine

The fastest dowel machine in the world.

Constructed to withstand the heavy and constant strain to which this type of machine is subjected.

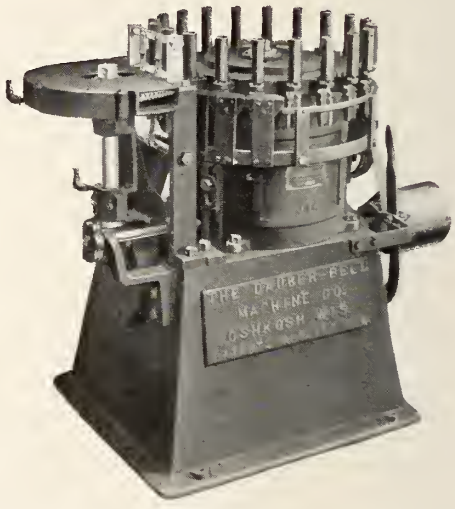
Equipped with a universal four-knife cutter head adjustable to turn rods of all diameters from 1/4" to 2" in either plain, spiral groove, longitudinal groove, or imitation reed wind. Special machine for turning rods of larger size.

Cutter-head mandrel is mounted at each end in ball-bearings of the highest grade.

Out-going feed rolls have combination of grooves so that many sizes can be made without changing feed rolls. The in-going feed rolls are adjustable for all sizes of squares.

Will work stock as short as 4½ inches.

Furnished with countershaft or motor drive.



Dowel Cutting Off and Pointing Machine

This machine is for cutting off and pointing dowel pins from long rods.

It will cut and point dowel pins of all diameters up to ¾", and in any length up to 6 inches.

Capacity of this machine is from 300 to 400 pins a minute. Any boy can operate it.

All working parts are completely enclosed and thus protected from dust and dirt.

Absolutely no danger to operator.

The floor space required by this machine is only 22" x 36".

Tight and loose pulleys on machine.

Furnished with belt or motor drive.

Capacity 30,000 to 40,000 lineal ft. per ten hours on 7/8 or 15/16 mop or sweeper handle stock.
If you are using any dowel machine of less capacity, figure your daily losses in labor and business.
Write us what dowel sizes you turn, and whether hard or soft wood. Ask for our demonstration proposition to show you how to double your production of dowel stock at the same labor cost.

The machine that is sent under a guarantee to show you a gain of from 100 to 400 per cent before you buy it.
The improved dowel machine that 90 per cent of the largest and oldest machinery builders and dealers now endorse and recommend in preference to the solid chuck machines they themselves previously built.
One cutter head turns from ¼-in. to 2-in. diameter.
Turns hard or soft wood equally well.
Handles heavy, oversized squares.
No choking of the cutter head.
Smooth stock.
Accurate sizes.
Works stock as short as five inches.
Rolls automatically center variations in squares.
Machines built to turn from ⅛ to 6-in.
We want to hear from every user of a solid chuck dowel machine.
We can save you from one dollar out of every two, to four out of every five that the operation of solid chuck machines costs you.
Engagements for competitive test solicited.
Formal orders not solicited. All sales made after demonstration.

The only question is, are you willing to cut cost of your dowel turning to one-half or one-third of what it costs with any make of solid chuck machine?
Machine delivers the goods before you buy.
State conditions of stock closely Special conditions require special equipment.

W. S. Hawker Mfg. Company, Dayton, Ohio

The wood finish that will not paper mark in shipment

A product finished with ZAPONITE, the Pioneer Wood Lacquer, is proof against the harmful effects of paper marking when wrapped and packed for shipment.

Being extremely hard and uneffected by moisture, heat and climate changes, a ZAPONITE finish never gets "sticky," it never paper marks and it never shows the imprint of burlap wrappings—another reason why ZAPONITE is the ideal finish for quality products made from wood.

Let our Service Division help you to determine how ZAPONITE can be used in finishing your products at a SAVING in your production costs. Write us about this service TODAY.

Celluloid Zapon Company

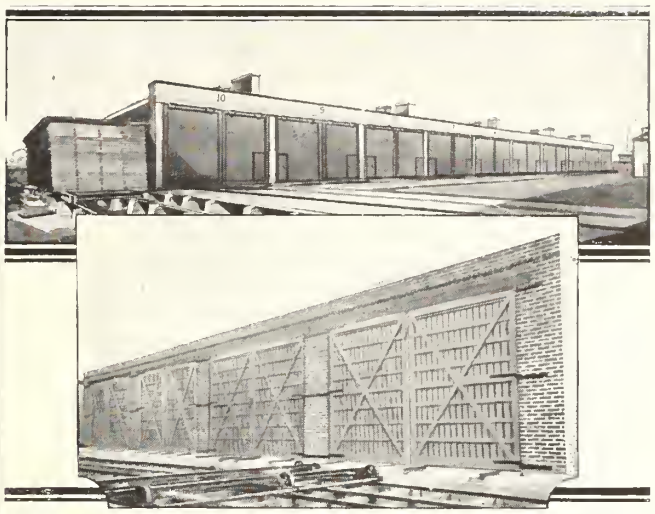
THE PIONEER
ZAPONITE
WOOD LACQUER



10 Kilns or 4 Kilns

Both of these installations have the same drying capacity

Each will dry 24000 board feet four quarter white oak from 25% to 6% moisture content per day.

THE large picture is a photograph of a battery of dry kilns of the ordinary ventilating type. The smaller picture is a photograph of Cutler Kilns of the same drying capacity.

Because a Cutler Kiln dries twice as fast it will do the work and do it better than a larger kiln of the old type. It will save half the time and half the money. Every Cutler Kiln user is a Cutler booster.

4 Cutler Engineers to help you

The Cutler Planning Engineer will be glad to work with you in designing a kiln to meet your particular requirements.

The Cutler Production Engineer will supervise the actual construction of your kiln and stay with the job until your men do get perfect results.

The Cutler Research Engineer is prepared to give you all latest statistical information, kiln records and new data.

The Cutler Service Engineer, available at all times, will help you solve any technical problems which may arise in your work.

The Cutler Kiln and Cutler System of Service is revolutionizing dry kiln methods.

Write for catalog, or better still state quantity and kind of lumber wanted per day as a base for a proposal. There is no obligation. Write today.

OPENKOTE

Garnet Finishing

Costs no more than any other

Send for samples at no cost to you

THE "OPENKOTE" PROCESS is our invention. All Garnet grains are arranged scientifically to create "valleys"—spaces between kernels—for dust clearance, longer wear, even surface, no sand on top of sand, no scratches, less bulk, greater flexibility.

It's the "finishing touch" in sandpaper—Be sure and say -- Behr's Openkote.

Every kernel of sand is an Imp of Efficiency eager to work for you.

SATISFACTION

There is no keener satisfaction than that which comes from making a wise and careful purchase.

The worthy article bought becomes a grateful reminder of the soundness of the choice, and in service ever justifies the investment made.

Builders of plywood construction require a glue that is dependable in quality at all times and purchasers of Perkins Vegetable Glue have the keen satisfaction that comes from buying a uniform and dependable product.

Grecian lady's cosmetic cabinet 2300 years old (300 B.C.) now in the Berlin Museum. It once contained cold-cream, rouge and eyebrow pencils.

MONITE WATERPROOF GLUE

is as great an improvement over the casein waterproof glue formula of the Greeks as the modern battleship is over the 300-oared war-galley of ancient Greece.

The Greeks Used This Glue 2500 Years Ago!

The following is translated from pp. 121-2 of "The Story of Furniture" ("Geschichte des Mobels") by A. Koeppen and C. Breuer, published at Berlin in 1904.

"Glue was a favorite fastener. There were two kinds of glue, the common kind, joiner's glue made from animal offal and fish bladders * * * and also the glue made from caustic lime and white of egg or casein, which had already been discovered by the Egyptians.

"Their wish to construct rich furniture at lower cost, as well as the experience that the use of a suitable core-wood makes flat pieces warp less than when heavy boards of costly wood were used. led them to adopt ply-work. This was cut with saws and fastened to an under layer of other wood with glue. Thus they made table-tops, chests, beds, etc.

"How widely this work was done in the olden times, there is much existing evidence that has been found in the graves of Crimea."

Ply-work, tenon or mortise joints; marvelous inlaid work giving pictorial effects with varied woods, tortise-shell, ivory, metals and precious stones were all made by the early Greeks with the aid of casein waterproof glue as early as 500 B.C. **2500 years ago!** Many excellent specimens of their work still remain—in European and American museums.

Monite Waterproof Glue is the modern scientifically perfected form of the casein waterproof glue used by the ancient Egyptians and Greeks. Joints and ply-wood made with MONITE are far superior to this glue-work of the Greeks which has endured 25 centuries.

Monite Waterproof Glue produces joints and panels that are heat and waterproof, glues wood with high or low moisture content, is mixed and applied by machinery or by hand, needs clamps for only 3 or 4 hours. It is as strong as hot glue and **costs but little more than vegetable glue.**

Let us send you a small sample panel made with MONITE for you to test by boiling, soaking, and baking. Write for the panel and our printed matter, NOW.

WE ARE TELLING THE PUBLIC: "BE SURE YOUR WALNUT IS REAL WALNUT."

AMERICAN WALNUT

"The Cabinet-wood of the Ages"

WE ARE TELLING THE PUBLIC: "BE SURE YOUR WALNUT IS REAL WALNUT."

Insure Your Profits

Did you ever stop to reflect, Mr. Manufacturer, on the fact that you are always sure of a **ready sale at a fair price** for anything you make in WALNUT?

The demand for American Walnut in furniture, interior trim and cabinet work of all kinds has been **steady** for centuries.

There are a lot of people who know and appreciate that the value of Walnut is genuine—an inherent quality and beauty that is never effaced. And the kind of people who have that appreciation are usually the people who have the money to gratify their desires.

Incidentally, our steadily pursued policy of national advertising is constantly widening the circle of those who want Walnut and is teaching them to be sure that they get real Walnut. It pays to use Walnut.

Our "Walnut Book" cotnains many valuable ideas and suggestions for the trade. We will gladly send you a copy on request.

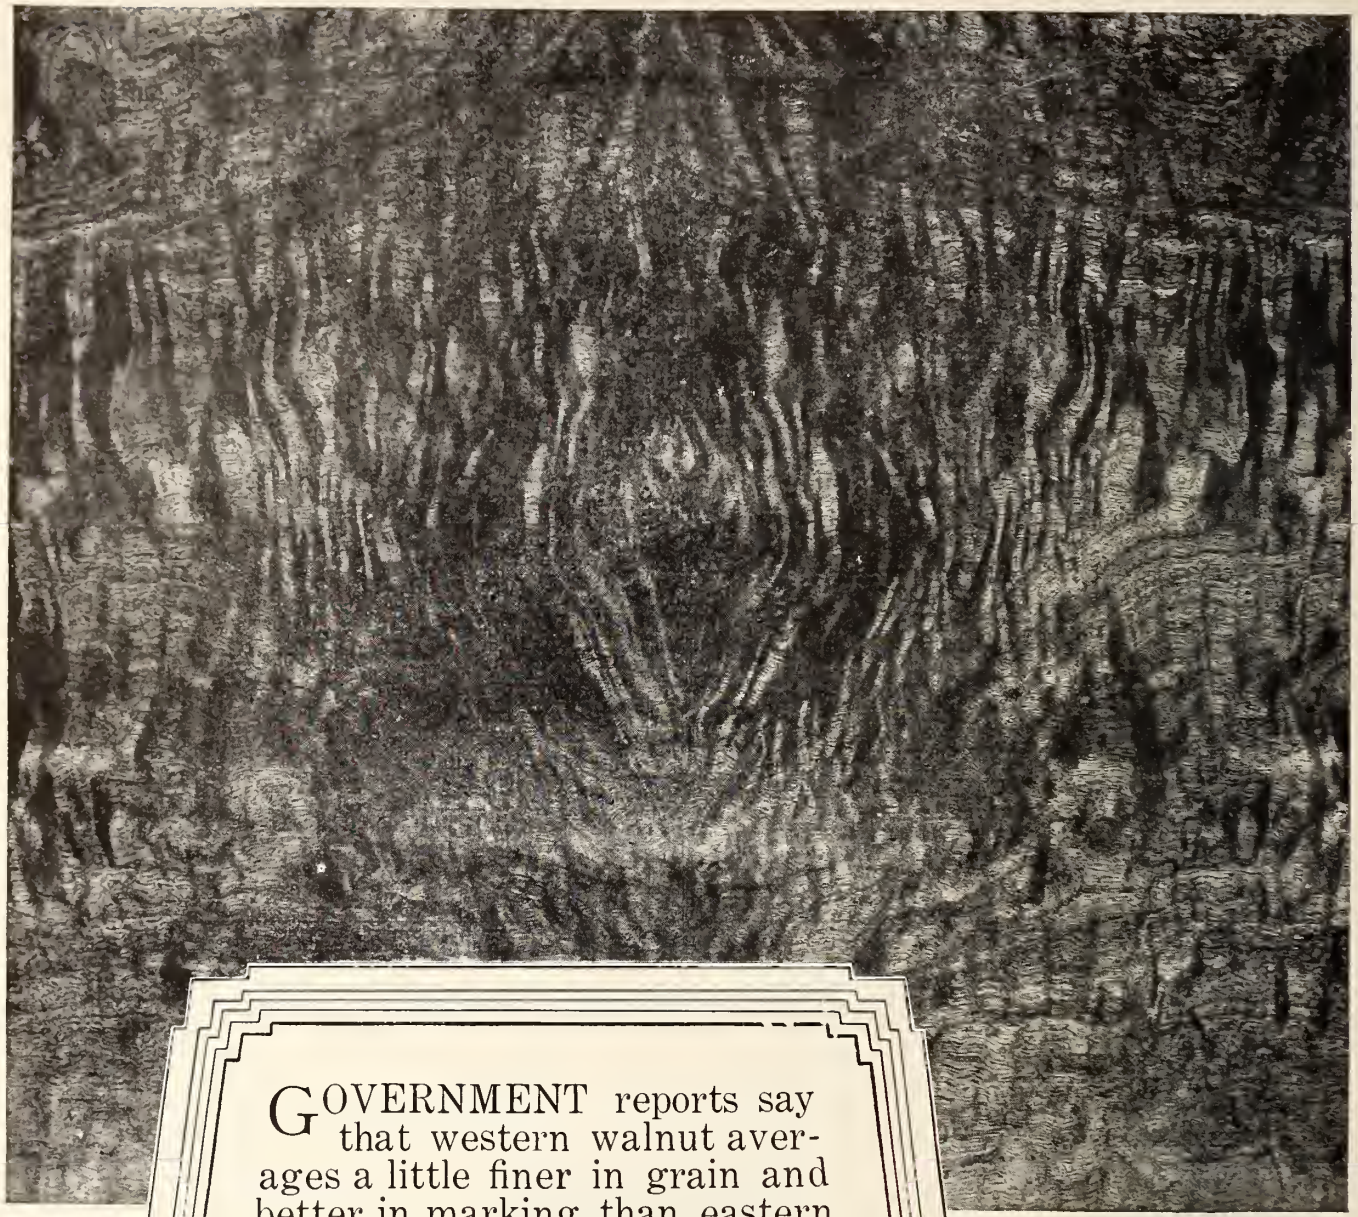
BARR-HOLADAY LUMBER CO.

BAND MILL AT LOUISE, MISS. GREENFIELD, OHIO



GOVERNMENT reports say that western walnut averages a little finer in grain and better in marking than eastern walnut—and that walnut grown in Iowa is a little better on the average than other western walnuts. Buyers for some of America's leading cabinet makers confirm this statement.

Let us quote you on your needs in Walnut Lumber and Veneers. Some especially good values now.

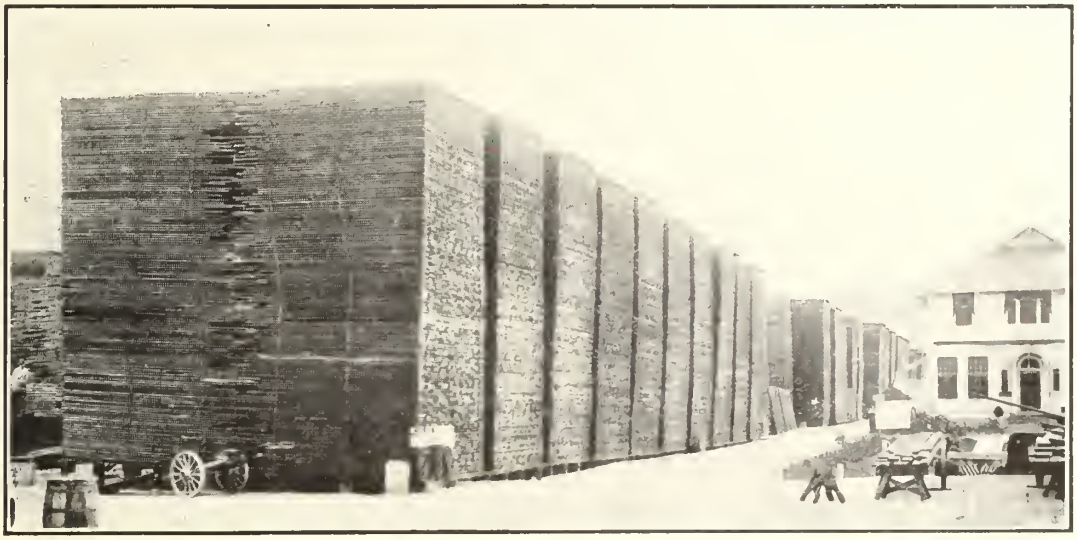
MAHOGANY



Rarely are such stores of precious wood to be found as may be seen in our yards. Across the seas from tropic lands it comes. From thick jungles where the light of day but dimly penetrates and where tangled native paths make difficult the bringing out of timber. Here the black man labors, risking life from jungle dangers, that supplies will not diminish and your orders may be filled.

Twelve million feet per year is the capacity of OTIS mills. An adequate supply is always on hand for prompt shipment. Get our prices.

Beautiful Birch

American Manufacturers use Canadian Birch

Supplied by Edward Clark & Sons, Limited

FOR years now furniture manufacturers of the New England and Middle Western States have looked to us for their supplies of Canadian Birch.

Year after year these makers continue to come to us. New customers have been added from time to time, of course.

It is only natural, therefore, that our sales of this beautiful wood should have steadily increased, as its fine and uniform quality, richness of grain and economical cost have become better known and recognized.

To buy Birch from Edward Clark & Sons is to be assured of generous grading, prompt shipments and helpful, courteous service.

This stock will work up with a minimum of waste resulting in lower costs. Send in an order today for a trial car and judge for yourself.

Oak Red Gum

Why Bruce Hardwoods Excel

For many years before we became hardwood lumber manufacturers, we were makers of fine Oak Flooring and are to-day the largest individual producers of that material.

The producing of good Oak Flooring is an exacting science—where perfection is attained—and teaches the value of both skilful grading of raw material and accuracy in milling.

With a full appreciation of the value of these factors, we entered also upon the manufacture of southern hardwoods and in the operation of this department, have applied them in the production of all items in white and red oak, gum, ash and other species.

With our joint facilities, we are equipped to ship square edge parquetry strips, oak trim and mouldings, as well as Oak Flooring in the same car with hardwood lumber.

Inquiry and correspondence invited.

Per Capita Furniture Expenditure Low

Why is the per capita expenditure for furniture in Canada lower than that in the United States? Figures recently issued, covering the American furniture industry, give as the total value of the furniture produced in 1919 a figure slightly in excess of $575,000,000. Estimating the population of the States at 115,000,000, this gives a per capita expenditure of $5.00 for each man, woman and child.

In Canada the total value of the furniture produced in the same year was in the neighborhood of $25,000,000., which, based on a population of 9,000,000, figures out in the neighborhood of $2.80 for each man, woman and child, or slightly in excess of 50% of the American per capita furniture expenditure. This goes to show what a wonderful opportunity the Canadian furniture manufacturers have for educational and publicity work. If through an extended educational campaign they were able to bring the per capita expenditure up to $5.00, it would practically mean doubling the output of all our factories.

When one considers that the claim has been made that a three-years' publicity campaign would double the American per capita expenditure for furniture, it makes one wonder just what the Canadian furniture manufacturers could accomplish if they went about it aggressively and persistently.

The Basis of Intelligent Competition

In commenting on the ideas of woodworking costs held by different woodworkers, one prominent manufacturer suggests that part, at least, of the wide discrepancy which exists in quotations secured from various sources, is due to the fact that sufficient particulars are not given when prices are being sought. A rough sketch is handed to a woodworker and he is asked to figure on it. Information as to details of construction is lacking, with the result that one manufacturer figures one way while another may figure from an entirely different angle. This means that while both quotations were based on the same sketch, yet they were not based on the same work. The point is well taken, for unless a woodworker knows every detail of the job on which he is figuring, he is not in a position to give a definite figure, yet is often called upon to do so and that in the face of keen competition. This leads up to the suggestion that if architects and others, when asking for estimates on millwork of any kind, were to give full particulars as to how the work is to be done, the woods used and the details of construction, there would not be such a wide difference in the estimates received.

The following quotation from a letter by C. B. Harman, of the Southern Sash, Door and Millwork Manufacturers Association, deals with this very subject:

> "A short time ago one of our members took an order for a mantel and as it was of very special design he was unable to figure the cost intelligently or safely, and booked the order on a cost plus, basis. Special moulding was required and a lot of tedious mitre work and so on. He made a charge of $40. The customer kicked on the price, saying that his contractor said he could get it made for less than half that price.
>
> "The customer then called on another local plant who made a price of $25 and another made a figure of $17.
>
> "I have the pencil drawing on my desk and without further information I can't see how any one could either safely make the mantel or a price for it, for the drawing certainly does not show what is wanted, either for size or detail.
>
> "I haven't seen the cost figures and don't know if our member's price of $40.00 is fair and proper, but granting that it is, what is the result? He has made the mantel and knows what it has cost, while several other factories take a guess at the cost. The customer naturally feels that the $17.00 figure should be the basis of settlement."

This naturally brings up the question of why woodworkers should be left to figure out the details of any job and left to draw up their own bills of material. Would it not be much more satisfactory from every point of view if, for instance, when an architect calls for figures for the millwork of a house, he would accompany such request with not only a sketch of place but with a bill of the material required. In this way all who are asked to tender would be figuring on exactly the same material. As it is now, one estimator takes off the quantities from the plans and specifications, but certain items are omitted, perhaps intentionally or again it may be unintentionally, but in any event it is only natural that his figure should be lower than those included all items in their estimate. If the party figuring low, receives the job, the architect or owner pays more in the long run, for all items omitted are charged up as "extras."

This condition has been overcome in certain sections of the United States by the formation of Associations or by independent organizations which take a plan or other order for millwork and draw up a uniform bill of material which is submitted to all who desire to tender on the work. When this is done, any fluctuation in the figures presented can be compared, for all quotations are based on the same material list.

Canada's First "Furniture Week" a Success

Windsor Retail Dealers Co-operate with Home Furnishings Bureau and Stage Interest Arousing Week—Satisfactory Volume of Business Results —Suggests New Line of Activity for Bureau

The week of April 24th-29th witnessed an innovation as far as furniture merchandising methods in Canada were concerned. This took the form of a Furniture Week, and was staged by the furniture dealers of Windsor, Ont., acting in close co-operation with the Home Furnishings Bureau, or perhaps, it would be more correct to say, acting on a suggestion from the Home Furnishings Bureau.

The idea was in reality to get as much publicity for and create an increased interest in furniture and home furnishings through increased advertising, special store and window displays, talks on home furnishing and color schemes, and in many other ways to focus attention on furniture and better furnished homes. The scheme was welcomed by the Windsor furniture dealers, who worked together in closest harmony, and, in addition, various public-spirited organizations took an active interest in making the week an outstanding event.

How the Scheme was Developed

This special week did not take the form of a centralized display, such as was staged in Detroit recently, but consisted largely of unusually attractive exhibits on the part of each individual dealer. Arrangements were made whereby each retailer undertook to change his window display every other day, giving 52 changes during the week. A schedule was drawn up so that there was not any duplication of window exhibits. In addition, every effort was made to have the furniture on the floors of each store arranged in an attractive manner so that each piece was shown to the best advantage. The windows contained attractive cards inviting the public to come in and look around; in fact this was the tenor of the advertising conducted by the retail dealers throughout the whole week. Instead of attempting to sell furniture in their newspaper space, they featured the home and extended a cordial invitation to the public to see their displays.

A feature of the week, which proved of considerable value, was a lecture and demonstration by John Crooks Gordon, instructor of Decorative Art at the Toronto Technical School. This followed closely the methods adopted with so much success by J. Ross Crane, of the Chicago Art Institute. During the course of his talk, Mr. Gordon furnished a living room on the stage, arranging suitable furniture supplied by Windsor dealers, to the best advantage, and explaining why each piece was selected and its place in the general scheme. At the same time he defined the basic principles upon which decorative color schemes are built and demonstrated his remarks by working out an attractive color scheme in full view of the audience. Mr. Gordon's talk was well received and at the close of his address, the ladies literally swarmed on the platform to ply him with questions pertaining to their own particular problems.

The younger generations were not overlooked. Pieces of furniture made by the pupils of several manual training classes were selected and judged, the judges being J. H. Baetz and F.E. Coombe, and prizes awarded to those responsible for the articles which showed the greatest originality in design as well as skill in the making and finishing.

Results all that were Expected

The result of this concentrated effort was that for a considerable period preceding the furniture week and during the week itself, furniture and home furnishings were a common topic of conversation. The housewife viewed her rooms with an unusually critical eye and resolved to make improvements here and there. During the week the displays were on, crowds of people visited the retail section for the sole purpose of seeing the furniture exhibits. Many who came to examine, remained to buy, while others came with a definite intention of improving the furnishings of their home or some particular room. From the viewpoint of sales alone, this week was a success and was well worth all time, effort and money expended. For the full six days the furniture dealers were extremely busy, many nice sales being recorded; in fact the demand for furniture was such that several retailers were forced to hire extra trucks to take care of their deliveries. The end is not yet, for the interest and enthusiasm thus aroused will not subside in a day, but will result in new sales for weeks and months to come.

From the viewpoint of the furniture manufacturer it is not an exaggeration to say that this was one of the most effective publicity and sales-building schemes ever inaugurated by the Home Furnishings Bureau and at such a small cost. For, an expenditure of a few hundred dollars for travelling, organization and advertising, the following publicity was obtained for the products of the furniture factories:— Three to five pages in each issue of the local papers devoted to furniture advertising and interesting and instructive articles dealing with furniture design, period furniture and various phases of home decorations; editorials on the home and its furnishings; sermons from different pulpits dealing with the influence of the home and why it should be made as attractive as possible, and desirable publicity of many other kinds. What is perhaps more to the point, a satisfactory quantity of furniture was sold and a market created which will absorb considerably more.

Will Have Permanent Effect

In addition to this, the retailers were brought closer together and made to realize what can be accomplished through co-operative effort, and at the same time were brought into closer touch with furniture manufacturers through the Home Furnishings Bureau and through the furniture makers who were in attendance. Another lesson learned by the dealers was that much can be accomplished through making their store and window displays as attractive as possible and changing their windows at frequent intervals. All this means increased furniture sales and a more united industry through years to come.

In view of all that was accomplished at Windsor

at such a small cost, would it not be advisable for furniture manufacturers working through the Home Furnishings Bureau, to make an organized effort at promoting Furniture Weeks at various centres? An organization could easily be developed which through time would be able to direct and promote special weeks of this kind in all the principal cities of Canada. The scheme may be an ambitious one but it is not impossible of accomplishment, and the results would more than justify the expenditure and effort involved.

Bending Southern Oak Chair Posts in Hot-plate Bender

Effect of Initial Moisture Content of Stock—Reducing Loss from Surface Checking—Moisture in Steam Chamber does not Reach Centre of Wood during Steaming Operations

By W. K. Loughborough*

From a technical standpoint, steam bending of wood has been and doubtless will continue to be a problem of great interest. It has a very practical significance for the manufacturers of chairs, vehicles, and barrels.

The chair manufacturers, moreover, have complicated their bending problem by the introduction of the hot-plate bender, the plates of which are heated with high-pressure live steam. This process fits in well with commercial requirements as it is much faster than the old hand-bending method. It seems to have been well demonstrated, however, that the slower process of hand bending does not cause so great a loss of material as the more rapid hot-plate bender process does. A loss of as much as 50 per cent in hot-plate bending is not uncommon. This is additional to the loss of material in the boards which are rejected because of unfitness for making chair posts. At one plant it was found that out of a thousand feet of oak chair post stock from the yard only 700 feet were fit for bending, and ultimately only about 300 feet were used in the finished chairs.

Need for Using Southern Oak

The problem of the chair manufacturers is made more acute by the fact that the supply of the more easily bent northern oak is rapidly becoming exhausted. The price of this class of material is also rapidly increasing, and the industries manufacturing the medium and cheaper grades of chairs are forced to use northern oak sparingly. Consequently there seems to be a growing tendency on the part of the chair manufacturers to use the cheaper southern swamp oaks.

Probably within ten years, at the present rate of consumption, the chair industry will be facing a crisis because of a lack of northern oak. For this reason the bending problem of the chair manufacturers is deserving of careful attention, and any discoveries will be welcomed that trend to conserve the supply of suitable bending material. This will be the result if information gained should justify the use of the cheaper southern woods which have hitherto been bent only with heavy losses.

Experiments in Steam Bending

As practically no data was available on the subject of steam bending, a co-operative project was arranged by the Forest Products Laboratory of the Forest Service with the Crocker Chair Company of Sheboygan, Wisconsin, to obtain, if possible, information that would tend to reduce bending losses to a minimum. The experiments were made in the company's bending room with commercial equipment and material. Some more or less concrete information was obtained concerning (1) moisture content of stock before steaming, (2) length of steaming period at different atmospheric pressures, and (3) how stock could best be dried after bending.

Description of Equipment Used

The machine used in these tests was a typical steam bender. It is built with seven hollow-formed steam plates. A 12-in. hydraulic cylinder forced these plates together, thus bending the material into the spaces between them. Straps of wide metal, on the ends of which angle irons are riveted, are used in each space between the plates. In these straps the posts are bent and dried. The openings are always loaded and material bent before another space is opened. The plates are provided with locking devices which permit the loading or unloading of a particular opening without interfering with the material in the other openings. The steam connections between the plates consist of swing joints which permit the plates to slide up and down on the end posts of the machine.

The three lowest plates of the machine, forming two openings, were used exclusively in these experiments. This equipment gave perfect control of the heat in the plates. With a pressure of 7 pounds on the bending machine, a maximum thermometer, the bulb of which was placed midway between the two plates, registered 212 degrees Fahrenheit; at 20 pounds pressure the temperature was slightly outside of the range of the thermometer but was estimated at between 225 degrees and 230 degrees; at 55 pound pressure the temperature between the plates was not even approximately estimated.

Kind of Material Used

The steaming was done at atmospheric pressure in a concrete steaming box about 3 feet wide, 6 feet high, and 10 feet long. Exhaust from the engines was passed through a water heater and then delivered to the steaming bores. It is, therefore, clear that the steam was saturated if not supersaturated before it left the heater. Numerous tests showed that the temperature in the steaming box was practically constant at 211 degrees.

The material used in these experiments was that commercially known as oak tie stock, that is, the side

*Assistant Engineer, Forest Products Laboratory, Madison, Wis.

lumber left in the manufacture of oak ties, and it was obtained from the company's yard. It was known to be southern oak, with the red and white species represented in about equal proportions.

The material was an inch thick, and as it was cut from the outside of the log, a large portion of the board was tangential or nearly tangential. Almost the entire board could be sawed into 2 inch strips having a radial or semi-radial edge, and the length was 39 inches. It was run through the sticker and surfaced on two edges. The chair posts were brought to the bending room and trimmed to length. The selected material was then put in the steaming box or retort and finally bent in the hot-plate bender.

The general scheme of the study was to group different variables so that one variable could be isolated and studied. The moisture content of the stock before steaming was considered the most important variable, and three percentages of moisture were selected: (1) 12 to 15 per cent., (2) 25 per cent., (3) 40 per cent. Thirty identical tests were made with each of the moisture classes, and these tests involved approximately 4,000 southern oak chair posts.

Humidification of the Plates

When one watches the hot-plate bending machine work, he gets the impression that the very high temperature and low humidities used in the plates must cause considerably more surface checking than would be produced by more conservative drying conditions.

An attempt was made to control the amount of surface checking somewhat by raising the humidity. The first method used was that of placing a thick, water-saturated, wool pad between the posts and the hot plates. In the earlier experiments a pad was placed on top and one beneath the posts so that no portion of the post came in direct contact with the hot-plate bender. As duel tests showed that the employment of these two pads did not change the results obtained by the use of the lower pad alone, the use of the upper pad was discontinued.

The reduction of the temperature in the steam plates was the only variable tried that showed a consistent reduction of surface checks; however, the time required to bend and dry the material was increased. To raise the humidity in the plate high enough to reduce surface checking is equivalent to depriving the present hot-plate bending machine of its only redeeming quality, namely, its speed of production. The tests, therefore, were not satisfactory in the direction of perfecting some system which would minimize the surface checking.

Bending Material While Hot and Moist

At the outset of the study it was noted that, to obtain the least amount of tension failures, the stock should be bent as soon as possible after being taken out of the steaming box. If 18 minutes intervened before bending, the stock seemed to have lost nearly all of its plasticity. As the intervening time was reduced, there was a consistent decrease in the percentage of rejections due to tension failures. In fact, if posts were bent within two minutes after they were taken from the steam box, the loss was practically the same, whether the posts were bent on a wet pad or not. The results of the experiments with the use of the wet pad indicated that for successful bending the tension surface should be moist and hot when the stock is bent.

The purpose of steaming is to soften the wood that is being bent so that the deformation can take place with the minimum amount of stress. The softening must be in proportion to the amount of deformation required.

The degree of plasticity varies both with the temperature and with the relative humidity of the air applied. Woodfibers become more plastic when steamed in saturated air at relatively high temperatures —180 degrees to 212 degrees for example—than when treated in air at 120 degrees and 100 per cent. humidity, or in air having a lower relative humidity at either high or low temperature, or when soaked in cold water.

As moisture penetrates wood very slowly, the moisture which is absorbed during a practical steaming period can not reach the inner fibers to soften them. It is largely the self-contained moisture that is effective in softening the inner fibers when a sufficient degree of heat is applied. If the bend tends appreciably to distort the central part of the stick then that part must be made plastic by a high percentage of self-contained moisture when steamed. Up to the fiber-saturation point the percentage of moisture the stick must contain is in proportion to the severity of the bend. The chair-post bend is ordinarily so mild that a high degree of plasticity is not required in the center, and consequently it is not necessary that the stock contain a high percentage of moisture.

The optimum steaming period preparatory to bending seems to vary with the percentage of moisture which the stock contains at the time it is steamed. If the moisture content is low, a long steaming treatment seems to be more beneficial in reducing tension failures than if the moisture content of the stock is high. If the stock contains 15 per cent. moisture or less, the preparatory steaming period may with benefit extend to an hour.

If the wood contains 25 per cent. moisture, it was observed that following a half hour steaming period there was only 2 per cent. more rejection from tension failure than resulted after stock that contained 12 to 15 per cent. moisture was steamed three hours. Obviously, the higher percentage of moisture a stick contains the more tendency there is to shrink as it dries. If a stick is dried in a hot-plate bender, its surface quickly becomes set and hardened, and shrinkage in cross section is almost entirely prevented. Severe drying conditions make surface checking and honey combing inevitable if the stock contains much moisture.

(Continued in the June issue)

Table Manufacturers Unite

A new organization known as the National Association of Table Manufacturers, was formed recently through a merger of the Central Bureau of Dining Table Manufacturers and the Association of Living Room Table Manufacturers. It is likely that this organization will be extended to include manufacturers of library and kitchen tables. This merger is a result of the tendency shown during recent years for manufacturers of tables to pull away from specialization and to increase the diversity of their lines. The tendency seems to have been towards making entire suites rather than specializating in one type of table. For this reason it was felt that the interests of these manufacturers could best be served through a central organization rather than through individual associations.

Systematizing the Furniture Factory

The Success of a Woodworking Project Often Depends as Much Upon System and Organization as Upon Equipment and Product—How Office Specialty Manufacturing Co. Follow Orders Through—Daily Reports Show Movement of Work From Department to Department

By L. R. Wright

The article in the April "Canadian Woodworker and Furniture Manufacturer," describing the lumber recording system of the Office Specialty Mfg. Co., Limited, Newmarket, Ont., contained so much of interest and value that it is with a feeling of gratification that we are able to present to our readers another article dealing with the system used in the same plant to facilitate the movement of work through their woodworking factory. Here, as in the case of lumber, close check is kept on all the orders going through and on every phase of the work.

All orders are prepared in the main office and reach the wood superintendent in the form of a "wood order," Fig. 1. Sufficient copies of this order are made to give one to each department through which the work will pass. This gives the department heads an idea of the work which is coming through. These orders contain full particulars as to the article itself, quantities, finish, etc. Cutting-bills, covering regular lines, are always on file. These are in the form of original tracings, Fig. 2. As soon as a "wood order" is received at the factory, a blueprint is made from the corresponding cutting-bill. The small figures shown above the finished sizes on the cutting-bill indicates the rough size or cutting allowance.

Picking Out Stock Parts

Before the cutting-bill is issued to the breaking-out department it is checked for stock items. This tends to prevent duplication. The stock items are divided into two classes, raw material and finished or piece parts. The raw material consists of parts which have been purchased outside, such as veneered tops and plywood or various kinds. Piece parts include various items which are run in quantities in the factory and carried in the stock room and may often include veneered tops and plywood panels when these latter pieces have been made in the factory. This distinction is made because in one case the part is shown as a purchased item while in the other instance the factory receives credit for its manufacture.

At the same time the cutting-bill is checked, a requisition is sent to the stock room for the trimmings required on that particular order. These are delivered to the trimming department, each order being kept in a separate box, where they are checked and receipted for. In this way there is no delay when the order reaches the trimming department.

The factory supplementary order, shown as Fig. 3, is used for what might be called interdepartmental orders. For instance, a certain desk might call for steel drawer slides or other steel parts which would have to be made in the steel-working plant. Such parts would be ordered on this form.

How Lumber is Calculated

After all stock items have been checked off the cutting-bill, it is sent to the breaking-out department. Those in charge of the swing cut-off saws secure the necessary stock from the dry storage. If for any reason it is found necessary to substitute material not called for on the bill, such as 5/4 stock instead of 4/4, such information is noted on the cutting-bill. After the order has been roughed out, the cutting-bill is returned to the superintendent's office where the net requirements of the order are calculated and tabulated on the back, and at the same time a requisition is made out covering the lumber used and forwarded to the cost department. This data is used by both the cost and record-keeping departments.

The total net requirements of the orders going through for any one month as compared with the total amount of lumber used, ascertained by monthly inventories of the stock in dry storage together with the quantity of lumber delivered to the dry storage during the same period, give the waste percentage for that month. After the net lumber requirements have been tabulated on the back of the cutting-bill, it is returned to the factory and the work put through, the bill remaining with the material until it has been completed. Rods showing full-size details are used for all stock work, and for certain parts where extreme accuracy is required, special forms and gauges have been provided.

Note how passage-ways are indicated in plant of Office Specialty Co.

Bonus Paid for Certain Operations

The various operations have been listed and designated with a number, and the workmen are required to use a separate time card, Fig. 4, for each individual operation. These are filled out, giving the required information and the time stamped on a job-recording clock. In this connection a bonus or incentive plan has been adopted for certain forms of

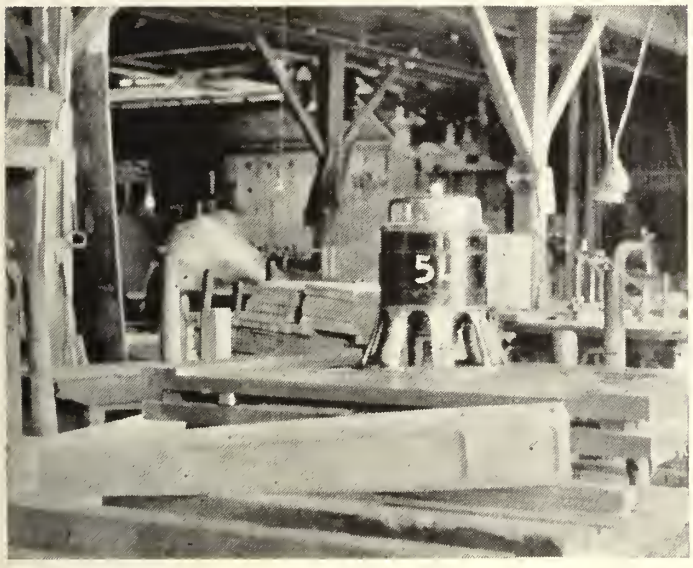
These forms are used to eliminate confusion and delays and maintain steady flow of work through the plant.

work. Standard costs have been fixed for certain operations based on time studies or the results of past performance. If a workman, through increased diligence or efficiency, succeeds in reducing the cost of that particular operation, he receives 50 per cent. of the savings thus effected. On operations of this kind a special extra pay card is used. If the cost is greater than the standard cost the workman does not lose.

As one department completes the work on a certain order, the material is passed along to the next department and a special receipt, Fig. 5, is secured, signed by the department foreman. This information is entered on the card headed "To the Office," Fig. 6, along with other deliveries made that very day, and the card forwarded to the main office every morning. This provides a close check on each order going through the plant as it shows where all the work is at any given time. In addition it provides a production report as it indicates the work completed in each department each day.

When an order or part of an order has been completed and delivered to the stock-room or shipping



Kelly routing machine in Office Specialty plant with sample of work in foreground

department, as the case may be, the "Original Check Slip" Fig. 7, is filled out and receipted. This indicates that the order in whole or part has been completed.

Check on Repairs and Replacements

Spoiled work is taken care of by a "Class C" order for, Fig. 8. This is used to order the repair or replacement of any spoiled article or part. In the case of a finished or nearly-finished article that has been damaged beyond repair, this form is used to write off the value of the article which has been rendered worthless. It will be noticed that the information given fixes the responsibility, both as to employee and machine, and also gives the total cost of the repairs or replacement, or in the case of a complete article, of the article itself.

Another special form, known as "Original Credit Requisition," is used for returning stock to stores. Suppose trimming hardware for 50 desks for a certain order had been delivered to the trimming department and for some reason or other only 45 desks were finally completed, this would leave hardware for 5 desks in the trimming department. The "Original Credit Requisition" is used to return this material to stores and to ensure that it is checked off and credited to the proper department.

Special Requisition for Crating

All crating is drawn under a special requisition, Fig. 9. This gives particulars as to the number and specifications of the different pieces required. As a rule the name of the customer for whom the order is intended is shown. With this data it is easy to determine the actual cost of the crating for each order, and as the crating stock is sized in what might be termed a "crating department," it facilitates the work of the packers, for the dimensioned crating stock is brought to them ready for assembling.

Where a delivery date is requested by the customer, a service card, not shown, is used. The service man visits the foreman of each department through which that particular order will pass, and ascertains how long it will take to put this particular piece of work through. In this way an accurate delivery date is secured and given to the customer. As the information secured from each foreman is recorded on the service card, it is incumbent upon him to live up to his promise.

Particulars of Plant Equipment

A few remarks with regard to the woodworking plant of the Office Specialty Mfg. Co. should prove of interest. The equipment consists of the usual run of woodworking machines, including double-end tenoner, straight edging saws, shapers, jointers, planers, dovetail machines, etc. Wherever practicable, special equipment has been provided for reducing manufacturing costs. Thus a special machine cuts 11 grooves and trims both ends of the drawer sides where a number of divisions are required; a six-spindle multiple boring machine handles all multiple boring, while another special machine trims and dados the sides for the vertical filing cabinets. An unusual piece of equipment for a plant of this kind is found in a "Kelly" routing machine. This is used for cutting sunken panels in legs of office and directors' tables and is also employed in connection with the making of the hollows in till drawers.

All equipment is driven by electricity, the group drive being employed. An unusual, but worth-while feature of this installation, is that all motors and mainshafts are placed under the floor. This not only does away with overhead belts, but makes it easy to oil and attend to the transmission equipment. Another advantage is that the motors and bearings are not subjected to the deteriorating effects of factory dust. The current, which is 60 cycle, is generated from steam power, utilizing shavings and other factory waste.

Another interesting feature is that the passageways on the machine floor are all marked with heavy painted lines. Instructions have been issued that these alleys are to be kept clear and unobstructed at all times. This aids in the movement of material as there is nothing to interfere with the free movement of the factory trucks.

Barrels Hoops from B. C. Woods

Manufacturers of cooperage stock in Canada will, doubtless, be interested in the new Pacific Hoop Co., which was recently organized in Portland, Oregon, to manufacture coiled hoops from spruce fir and other Pacific Coast woods. This new venture has been made possible by a patented process through which the hoops pass preparatory to coiling.

Only Well Managed Plants Survive

Third and Last of Series of Articles Dealing With the Organization and Management of Woodworking Plants

By L. G. Cattermole*

In conjunction with the other phases of betterment methods, plans should be laid for the development of an organization with clearly defined duties and responsibilities. Contrast two actual organizations as they exist today in the woodworking industry. Both plants are about the same size, both employ about the same number of men, and manufacture a similar article. The two sons of the original founder of the business in both cases are taking an active interest in the direction of the business.

In the first organization the duties of each member are clearly defined—the elder brother is in general charge of the business, the younger brother has direct charge of all manufacturing. The younger brother is expected to attain results—and he does it, because he has full authority to enforce his orders. In the second organization the duties of no executive member is defined in any manner whatsoever. The elder brother is supposed to take general charge of the business, but owing to his vacillating policies and lack of ability to make decisions, other members of the organizations constantly exceed their authority and make his decisions for him. The younger brother is also supposed to have direct charge of manufacturing, but the general manager is constantly going over his head, and giving detailed instructions to his subordinates without consulting him. The result, as can be easily imagined is chaos.

A Pointed Question

If a plant reflects the personality of the guiding executive are you satisfied with what your plant indicates?

In the first plant, a smooth-running organization performs its duties in a quiet, capable manner, friction is practically unknown, and a condition of contentment pervades every member. In the second plant, friction, trouble, and discontent is everywhere apparent; no one troubles about performing their duties in the most effective manner, and a large labor turnover is experienced. It is true, as someone has stated before, that every organization is a reflection of some one person as its executive head. Whether the organization is a failure or a success is dependent upon the policies which are inaugurated by this person. But he must be big enough, broad enough to realize that he cannot, except in the very smallest of manufacturing establishments, hope to handle all the details of the business personally.

It is necessary, to prevent stagnation, for an organization to secure "new blood" from time to time. An ingrowing organization may never hope to attain the success that an organization which is constantly adopting new men, new methods, and new machinery. A large plant in New England had a plant executive who had been with them for twenty years. Every one in that organization, from the president down, knew that this man was no executive, in fact he had become so lazy he seldom gave an order or made a decision. The plant he was in charge of, reflected this spirit, in that it was only producing about fifty percent of its possible capacity. He was being kept "because he knew machine operation," as those above him expressed it. When it was shown that he was many years behind woodworking progress on the points with which he was supposed to be most familiar, he was given an opportunity to make good in a smaller job, in one of the company's smaller plants, and his old position was given to an outside man with no experience in that particular industry. The change was found to be a beneficial one for all concerned, the change awakened the man from his comatose condition, and he was later taken back into a position far superior to his original one. The new man, through his aggressive, indominatable spirit, awakened the workers to their responsibilities and within a short time had the plant attaining ninety-five percent of its possible maximum capacity, with a standard of much higher quality.

Where is Your Organization Weak?

The general manager of a woodworking plant employing over three hundred men, had delegated no one to assume authority during his absence. For four hours each afternoon he worked, personally, behind locked doors, on a speed boat for his summer camp, and gave orders that during that time, he was not to be disturbed. Yet he has been heard to reflect aloud that his plant is going to the demnition bow-wows, and he couldn't understand why.

The above are exaggerated cases, undoubtedly. At the same time they reflect the idiosyncrasies which are costing many concerns real money. Straighten out a great many of these organization defects, and greater sales, greater profits, greater happiness and smoother-running organizations will be the result.

One of the last things to be undertaken by industrial engineers during the period of installation of management methods, are the final definition (in consultation with the clients' executive personnel) of the manufacturing, sales and financial policies.

Briefly, these policies include simple methods, whereby conditions in any or all of these phases of the business can be quickly and effectively analyzed and adjusted to meet current conditions. One of the real tests of any concern is its ability to readily adjust itself to current business conditions, which be-

*Chief Industrial Engineer, Cooley & Marvin Co.

comes a simple problem if general policies have been outlined to meet such conditions; and methods of analysis have been developed to point out the "rocks on the sea of progress."

Necessity of Planning Ahead

Most woodworking concerns have developed over a period of a long term of years, without any definite plans having been laid for growth or expansion. As a result the buildings are poorly adapted to the manufacture of the product, and are poorly arranged as regards their relative position to each other. It is desirable that a study of the possible future development of the concern should be made, and plans for expansion so outlined, that future contingencies will be taken care of, as soon as the necessity for change arises.

The above general discription of methodizing a woodworking plant is intended as a help to all managers who plan to improve their conditions, regardless of whether done by their own organizations or a firm of outside specialists. A disinterested current article in one of the leading trade papers has this to say regarding the necessity for this work:

"The days of real, stiff competition are on us once more and only the well managed plants—will survive.

"The three greatest factors toward success are machine equipment, methods, and men, and it's a toss-up as to which comes first.—Now is the time—to lay plans and get ready for the battle of trade. Study your machine equipment—. Study your methods. Eliminate the waste and lost motion that grew up when the only object was big production. Hire a real engineer to do it for you if necessary. But get one who is not full of fancy frills. Plain horse sense is the best qualification he can have—.

"And don't forget the men—the human problem is, after all, the biggest—and getting larger every day.

"These three factors are the legs of the stool on which success must sit."

And entirely outside of the necessity for bettering conditions there is a reward—a material reward which can be measured in terms of dollars; a mental reward which will key up the entire organization to thinking about its work, rather than performing its duties perfunctorily; a spiritual reward which comes from the knowledge of having discharged part of the responsibilities of management by bettering the conditions of those dependent upon the business for a livelihood.

The Facts Behind the Cost Figures

How Cost Data Should be Used—Indicates What Lines Should be Pushed Hardest—Influence of Production on Cost Often Overlooked—Sometimes Advisable to Accept Business Below Cost Shown by Records

By J. Lee Nicholason*

In studying the process of manufacturing through figures, it is not sufficient that the executive give consideration only to the cost of articles. These figures are reflections of conditions into which enter other elements very essential to utimate welfare. Without a proper knowledge of such elements and their variations, the possibilities of a situation are not brought out and policies of operation for the future may not be founded on facts.

A cost system is necessarily supported by statistics which show their value and relation to the moving situation. They are necessary as a presentation of running facts illuminating conditions for the information of the executive so that his judgment and energy may be guided by certain knowledge. The facts must be shown to make the situation clear, otherwise he may be misguided. Cost data may be divided under two principal heads, namely, administrative reports and reports for the sales department.

The purpose of administrative reports may be suggested as follows:—(a) To determine what changes may be made in the cost system to secure better data; (b) For the purpose of taking executive action on leaks, as indicated by the cost reports, such, for instance, as unbalanced operating departments, defective work, and excess overhead; (c) For the purpose of determining executive action in connection with the sales department.

Many Leaks Often Shown

Reports for the administrative department should be analyzed in as brief a form as possible and may be either daily, weekly or monthly, depending upon the conditions existing in the particular plant. They should be drawn as far as possible in comparative form and should show the daily production of each department, material, labor and overhead costs, and the percentage of overhead to production.

While looking over the cost system a number of years ago in a large manufacturing plant, employing over 2,000 people, I discovered very good reports to the executive. These, I observed, indicated many leaks and exhibited conditions which should have been corrected, and which, if corrected, would have lowered the cost of the production considerably. I remarked to the head of the cost department, "Evidently you are getting a great deal of good from your cost system.'

"On the contrary," he said, "we are getting very little good from it. I am instructed to file the reports with the general manager, but I very rarely hear anything more about them."

The general manager, who was practically the head of the business, had requested me to review his organization as a whole, so I took up the question of the cost reports with him.

Reluctantly he admitted that his duties did not permit him to give these reports the attention they deserved and required. He had the burden of the sales department on his mind and was frequently away. However, he always had intended to look over these reports and take action along the lines indicated.

"But," he said, opening a drawer in his desk and exhibiting a heap of them, "they accumulated too rapidly."

"Do you consider that a good business policy?" I asked.

"No," he admitted, " it is not."

"What would you do with one of your department

*In "Trained Men."

heads, if you knew he neglected the duties entrusted to him as you have neglected to study these cost report?"

"Let him go immediately!" he asserted, with great positiveness. "But what am I to do?" he went on in distress.

"One of two things," I answered. "Either find time every day to examine the reports and act upon them accordingly, or delegate this responsibility to some one else."

Cost System Best Investment

Considering the expense and effort attached to the operation of a cost system there are a surprising number of cases in which the cost data is not utilized. Of course cost systems are too expensive to operate, as some charge them to be, when the cost data is not properly utilized. However, no matter what the operating cost may be, a system is not too expensive, if the data supplied is used in a practical manner. In fact, I do not believe that a better investment can be made by a manufacturer. Failure to utilize does not rest with the head of the cost accounting department but with the executive. Imagination, practical instinct, and the co-operation of the executive organization are vital necessities in the attainment of results of maximum value.

Cost reports should be devised in such a manner that the figures represent something more than mere figures. Where a leak or a wrong condition is existing, figures alone might not be sufficient to enlighten an executive. In that case a note should be attached, calling particular attention to whatever phase that requires action.

There has been much criticism of cost systems in the last fifteen years; in fact, ever since the cost system was known. Its introduction has been almost forced on the manufacturer, all because the benefits are rarely understood or used. If the average manufacturer had as clear a vision of the value of a cost system as he has of selling his product, for instance, no further argument would be necessary. To perfect his business to the finest possible point, he would seek the best methods of cost accounting with just as much energy and enthusiasm as he seeks the market for the disposal of his product.

Indicate Articles on which Profit is Largest

Cost reports used in connection with a sales department are, I believe, of more value in promoting profit than any other element in connection with cost accounting. Unfortunately sales departments are often kept in absolute ignorance of the cost of production. As a rule a manufacturing plant has a number of different articles which it manufactures and sells. Of course the cost of these articles and their selling price varies. In some cases certain articles are sold at cost and even below, a condition brought about by competition and trade conditions. Sometimes one article must be carried to help sell some other product. A salesman is not required to sell an article upon which there is no profit, we are told, because the article practically sells itself. On the other hand, the salesman has before him at all times the temptation to sell the article which is easiest to sell.

A number of years ago, when examining the organization of a wholesale grocery business, I discovered that it was paying its salesmen a fair salary, plus a small per cent. of commission and traveling expenses. By examining the detail records of the men, I also discovered that the sales by some of them, of sugar and a few other things, upon which there was no profit, amounted to more than 25 per cent. of their total sales, whereas the per cent. of other salesmen on the same articles was as low as ten per cent. It was not difficult to see who were the money makers for that concern. The incentive to sell an article upon which there was no profit was removed, but there was created an incentive to sell the more profitable articles.

The sales and the manufacturing departments are of equal importance. Goods cannot be sold, of course, until they are made. One of the fundamentals in manufacturing is to determine the volume of sales to be made before a profit can be realized. The cost of material and labor in manufacturing is fairly constant with the production, but the overhead does not advance or reduce in the same proportion. It can be very clearly seen, therefore, that the sales and the manufacturing departments should work very closely together, always remembering that the cost of manufacturing, on account of the overhead, will either represent profit or loss, depending entirely upon the volume of manufacture.

Overhead Influenced by Production

A large sum of money is lost each year because the selling price is based upon a large production and then sales are made in small quantities which, of course, increase the cost per unit. In such a case, often the cost of the article is higher than the selling price. I have known numerous cases where costs were based on units of dozens, or hundreds, or thousands, and where sales were made in quantities of one-twelfth, or one-sixth, of a dozen, or in lots of five, ten, or one hundred, when sales should have been by the thousand. If the cost data is brought to the attention of the executive and if the sales department shows actual loss in these cases, such a picture should be presented that the facts could not easily be disregarded.

In fixing the selling price, one of the most important elements to consider is overhead. Especially is this true if the system shows departmental overhead, which has a tendency to put overhead directly where it belongs. As I have said before, the relation of this cost to quantity should always be recognized, for it must be remembered that if the sales and production of a single article falls off, not only is a heavier overhead added to the smaller production, but the overhead on the other articles is also prorated and increased, thereby reducing the profit as a whole.

When called upon to make a price which would increase production, a manufacturer is very apt to figure upon the same margin of cost or overhead as shown by his records up to that point. If he should happen to have competition, he is liable not only to lose the order and the profit on the order, but he will also probably reduce the profit on other items manufactured.

How Business is Often Lost

The president of a large manufacturing plant in Connecticut appeared unusually depressed when I was in his office. When asked why, he told me that he had just lost a very large order of approximately $250,000., which had gone to a competitor. But he was feeling especially bad because, when given an opportunity to revise his figures, he could not see his way clear to change them, according to his cost re-

cords. It was a repeat order, but the buyer had received a bid from another concern for the same article and same quantity at a lower price. This article was manufactured complete in one particular department of the plant.

The loss of the order would increase the overhead on other articles manufactured in that department between thirty and fifty per cent., and also would increase the general administrative overhead about ten per cent.

I asked to see the figures and found that in figuring the costs, he used the same percentage of overhead as was used before, and then added to it the usual percentage for overhead, administrative and selling, to figure out the profit and selling price. No selling expense was attached to this order, for no salesmen were employed in securing it. Furthermore, the administrative expense would remain exactly the same, whether he took the order or not. Taking all facts into consideration, we revised our estimate and discovered that, in cutting out the administrative overhead and the selling overhead, and by revising the departmental overhead, he would have made $50,000.00 on this order, covering a period of only three months.

Many stories of this kind could be told, but the idea I wish most to impress upon the mind of the manufacturer is the great importance of the proper use of cost data. Without it your effort will be in vain, and you will grope in the darkness. With it, you have at your command a force for success.

What is Your Cost on this Set of Stairs?

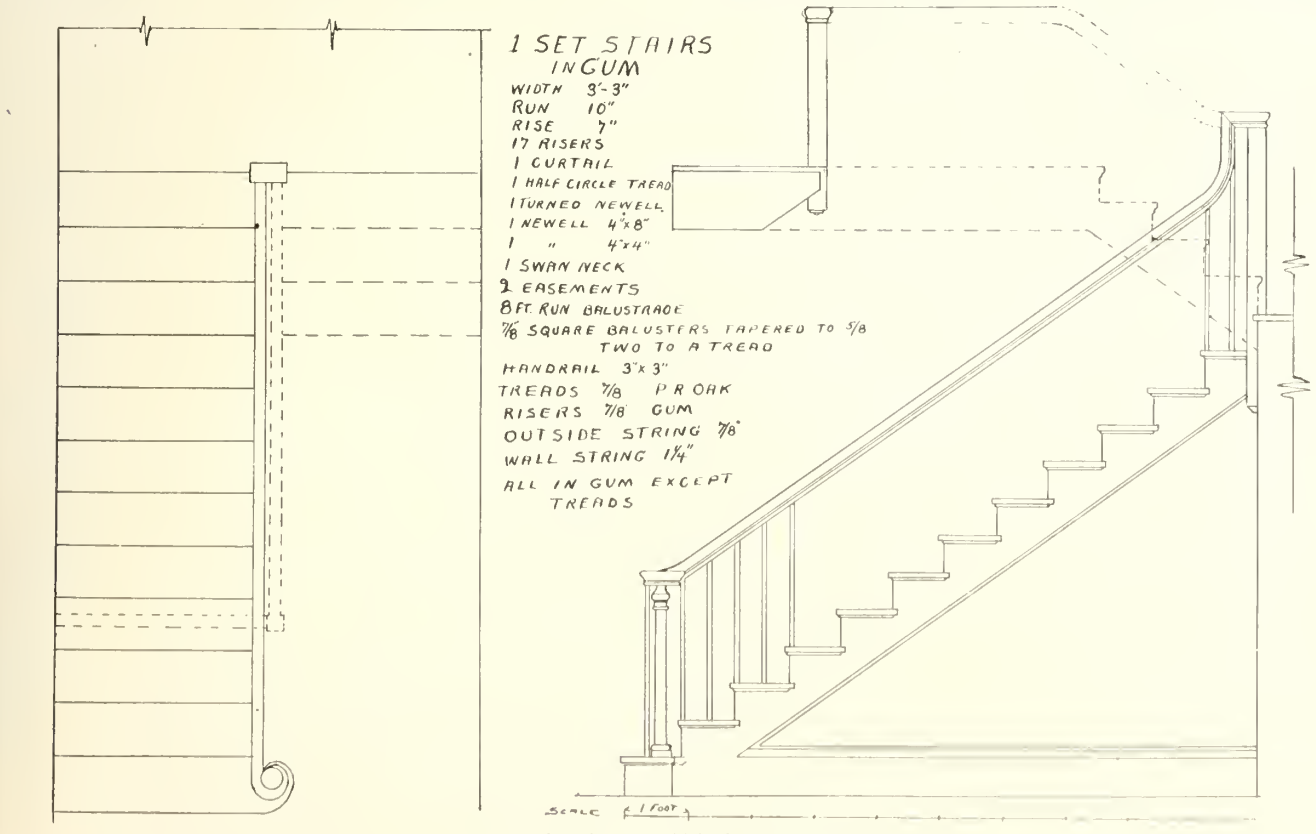
Application of Cost Book "A" by Millwork Cost Bureau—Far too Great a Variation in Time and Material—Why Greater Attention to Costs is Necessary

What do you think of a variation of $10,000.00 on a $30,000.00 job. Figures were requested recently on the interior woodwork for a large hall. This work was extremely elaborate and intricate and required a large amount of hand carving. Among the estimates submitted was one prepared by a woodworker who carefully listed and estimated every detail of the work, basing his figures on records of past performances. Before sending in his estimate, he rechecked his figures and satisfied himself that his bid of $33,000.00 was a fair one based on the quantity of material and amount of work involved. You can understand his feelings and thoughts when he learned that a competitor was awarded the work on a basis of $23,000.00, or $10,000.00 less. What is more to the point, how will the successful bidder come out. This points out the necessity for arousing a greater interest in accurate costs.

With such an interesting study as stairs for a subject for the cost article in this issue, instead of only sixteen sets of cost figures, it should have been possible to show twenty-five or thirty. Unless those who keep costs and realize the value of arousing a greater interest in accurate costs, are willing to do their part to maintain interest in this series of cost articles, it is going to be difficult to accomplish the desired results.

Competition the Unknown Factor

It does not require a very great stretch of one's imagination to hear some of the "guessers" say "Why



Sketch of stairs on which figures were taken

Estimate by Millwork Cost Bureau

1 Flight stairs, sap gum, per detail fitted and K. D. No rough carriages, platform flooring nor base.

"Basis cost" Pg. 3—less 60%				$148.47

all this fuss about costs when out of the whole of Canada only fifteen woodworkers are interested in cost work?" There is this to be said in favor of participation in these studies, and that is, no matter how much you know about your own costs and regardless of the degree of accuracy with which you are able to estimate, such knowledge does not count for much when figuring against those who guess. For this reason alone, if for no other, it is your own best interests to take an active part in any movement which tends to raise the standard of the competition with which you are faced.

An interesting feature of this article is an estimate from the Millwork Cost Bureau based on their Cost Book "A". In submitting these figures, they have this to say:

"Kindly note that this flight of stairs is figured completely machined and fitted, so that the contractor will have no trouble in setting up the work; but the material is delivered K.D. As rough carriages or horses, and platform flooring are sometimes furnished as a part of a stair, it is important to note that our cost does not include these items.

"In the application of Cost Book "A", illustrated in our cost estimate, you will note that each part of the complete stair is figured as a separate unit, and the pages of Cost Book "A" from which the prices were taken are marked in connection with each separate item. The total Cost Book "A" list is shown, as is also the basis cost, which is arrived at by deducting 60% from the Cost Book "A" list.

"Your list of material simply calls for Gum and we understand that in this instance you desire Sap Gum and not Red Gum. We note from your list of material that terms are in use in your territory which in some instances are at variance with those more widely used; for instance, in most territories a swan neck would be termed "gooseneck". We do not know what part of the stair you would term the curtail, but we have simply figured the entire piece of work using our terms throughout, which we trust will be perfectly clear.

"You will possibly observe that, while in a general sense, this stair is considered open, we figure three of the risers to be box risers in nature, and have figured them accordingly. Such risers in stair flights as do not require face strings are considered on the box basis. All other risers in the flight are considered either open or curb, as the case may be. In this instance, risers 1, 13, and 17 do not require face strings and, therefore, are figured as box stair risers.

"The drawing does not indicate the number of balusters that are required for the spiral rail at the start; in fact, only one baluster is indicated on the

Total Cost			212.66

elevation, but we concluded that at least three would be required for the starting spiral and have included this number in our estimate. We would judge from the drawing that the mill would be required to furnish wellhole skirting or trim around the wellhole, and we have therefore figured eight lineal feet of plain wellhole skirting."

Average Costs Good Guide

While the figures kept on the job, No. 10, show a cost of $212.66, it is doubtful it the estimate of the Bureau showing a basic cost of $148.47, is as far out as it at first appears. The manager of the plant which did the work admitted that his cost is high. It is accurate enough, but he believes that more time was put on these stairs than was absolutely necessary; in

tact he thinks that a fair average figure for this piece of work would be in the neighborhood of $165.00 to $175.00. This bears out the contention of the Millwork Bureau that the cost on any one order is not a suitable basis upon which to estimate. Costs fluctuate beyond the control of this management. That being the case, the only accurate basis to use for estimating, is average costs. This is the Millwork Bureau idea with regard to Cost Book "A", only the average costs used are the average composite figures taken from the 500 plants comprising the membership.

A reference to the list of estimates submitted shows the usual variations. There is no doubt as to which one would receive the contract, and there is just as little doubt as to whether or not a profit would be made. The material column shows too great a fluctuation. While there is always bound to be some difference between the material charges at different plants, there is nothing to justify a variation of 100%, just as there is nothing to justify the difference of 150% in total costs.

Small Waste Allowance

The first item in the waste column will probably give cause for amusement. A 10% waste allowance on a job of this kind is totally inadequate. The same holds true of those who only allow 15%. They lose out here, for the waste is bound to be greater than this. I had access to some cost records not long ago and the total average taken for a period of 12 months was slightly in excess of 45%. This was in furniture work and may not be a good comparison but it indicates how the waste mounts up.

The other columns may well speak for themselves. The estimates of bench hours vary from 116 to 25½ hours, and the rates from 85 cents to $1.10 per hour; machine time from 13 to 72½ hours and the rates from 85 cents to $1.50 per hour. This should not be so. There is no reason why the bench work should take four times as long in one plant as in another or the machine work show a variation of nearly 500%. There is something radically wrong with the basis upon which some of these estimates were made, that is, if there was any basis which is extremely doubtful in some instances.

A set of French doors, as shown in the accompanying sketch, has been selected for the June cost study. This is a job that every woodworker is often called upon to make. Particulars are 1 3/8", B. C. fir doors, with D.D. glass. The lower panels are ½", 3-ply fir. This order called for doors only, and in the white. Don't let the other fellow do all the estimating. That is not the proper spirit. Take the first chance you get during the next day or two and figure out your idea of the cost of these doors. You will be interested in learning how your estimate compares with the others submitted. A better suggestion is to send your estimate in by to-day's mail.

List of Estimates Received

No.	Material	Waste	Bench hours.	Rate	Machine hours.	Rate	Commercial Burden	Total
1	$36.80	10 %	43	$ .80	13	$ .90	15	$ 98.60

Subject selected for cost study for the June issue. Don't let this one pass

Principles Involved in Drying Last Blocks

Kiln Drying These Small Irregular Shaped Blocks Presents Difficult Problem—Careful Operation Required—Short Air Travel Improves Drying Operation

By K. Redman* Dry Kiln Engineer

The drying of shoe lasts, bowling pins and similar sized hardwood products presents many unusual problems undreamed of by the ordinary kiln operator who handles only 4/4 stock. In the first place the size of the rough turned last is several inches in thickness thus forming a large core. To dry this core without drying the outer portions of the last at a faster rate is one of the features to be accomplished. Again, the end evaporation must be kept down for there is no great allowance for end checks and we all know the tendency of the ends to dry faster than any other section. The odd shapes and various sizes met with in a single kiln charge adds to the difficulties for there is no possibility of regular stacking, uniform flues etc., for the passage of the air, as is the case in the regular tiers of lumber, for they are thrown into the kiln in a hit or miss fashion.

Let us consider the block, which is in cross section like a shoe only considerably longer, as divided into two portions, the outer ½" called the shell and all the remaining inner section called the core. The cardinal principle to be observed in actual drying practice is; "to dry the shell at a rate not faster than that at which the moisture can flow or work out from the center of the core to the shell." Although this principle is true of all lumber drying it is of the very greatest importance in successfully drying last blocks.

Checking and Case Hardening Chief Troubles

The thickness of the shoe last with its large core is the cause of the difficulty in drying. When the drying progresses too rapidly the shell dries faster than the core, the actual shrinkage being in the same proportion. Thus the fast shrinking shell is drawn tightly about the slower shrinkage core until the stresses set up become so great that the fibres pull apart and the block is checked and ruined. Or, on the other hand, the shell may case harden and set in an extended and rigid shape. Then, when the core dries out more slowly and hence shrinks further in proportion, the case hardened shell resists this further shrinkage, and the outer parts of the core clinging to the shell cause the core to give way in the center. These are commonly called honey-comb or hollow-horn checks.

In order to dry successfully we must have kiln equipment delivering the proper quantities of heat and moisture to the blocks by means of a uniform flow of air. The air in this case acts as the drying agent delivering to the blocks heat and moisture; heat is given up in exchange for the moisture and the air continues on carrying away an additional amount of moisture to be discharged outside the kiln. But, why does the air carry moisture to the block in the first place? Simply so that there will not be too great a transfer of heat in exchange for moisture, thus causing too rapid drying and hence checking and even splitting. You consider the humidity of the entering air as a sort of safety device to protect the blocks from damage.

Another factor to consider is to make positive that these drying conditions are delivered to each and every block, alike, throughout the entire kiln. Of course, it is impracticable to have a kiln chamber for each last block which theoretically would be ideal, but it is possible to cut the travel of the air across only a few feet of piled blocks, rather than through eight or ten feet. Under the latter conditions the air picks up the moisture from the first blocks encountered and by the time it has travelled through five or six feet it may be depositing moisture rather than picking it up.

This leads to the principle that the kiln must not be overloaded in a similar manner than one might overload an electric motor. Overloading in this case is too great an air travel through the blocks with consequent uneven drying conditions in the kiln. To sum up, there must be positive and continuous control of heat, humidity and circulation with the air only travelling across a few blocks so that the drying will be uniform throughout the entire kiln and identical conditions delivered to each and every block.

Automatic Control Desirable

To accomplish the above requirements the writer believes the best results can be obtained by heating and humidifying the air before it enters the kiln and distributing it by a system of ducts so that each block receives an equal amount of this properly conditioned air. Kilns have been designed in which the air only travels across 3½ ft. of blocks and in this case the last foot of blocks receives practically the same treatment as the first. Of course, the kiln buildings in any case must be constructed so that extreme cold weather won't materially affect drying conditions.

The drying equipment should not only consist of heating and humidifying apparatus, but these should be controlled automatically and the conditions recorded day and night by a psychrometer. Testing instruments must be on hand so that the operator may know the exact amount of moisture in both shell and core and the difference should not be permitted to exceed 5% at any time. When a greater difference is found the blocks should be steamed so that the M. C. of the shell will equal or closely approach that of the core.

General Practice Past, Present and Future

In the past it has been customery to air season in large sheds for six months to a year before it was considered safe to put the blocks in kilns. This was before the day of humidified air, when dry air was used to accomplish final drying only. Today it is possible to put green blocks fresh from the lathe into the kiln, but most kilns force the air through six to ten feet of blocks and thus slow up the drying time of the entire kiln to a period of forty to fifty-five days, depending upon the original moisture content.

Tomorrow will see the general use of the kiln with only a three or four foot air travel, with all the blocks drying practically as a unit and the time consequently cut nearly in half. Where drying conditions may be manufactured at will, there is no sense nor economy in trusting in the kindness of a fickle weatherman.

How to Look After Band Saw Teeth

Special Attention to Swaging and Shaping Teeth —Three Gauges More Than Thickness of Blade for Best Results—Attention to Saw When Grinding

If the saw chatters in the cut, runs snakey at times, and does not make the lumber as smooth as it should, the difficulty may be in carrying too much swage, particularly when sawing hardwood. Usually about three gauges more than the thickness of the saw is sufficient. Sometimes even a trifle less than

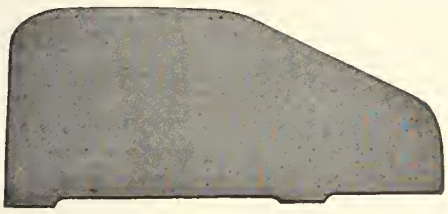

Fig. 100—Gauge for testing teeth

this will work satisfactorily provided the blade is perfectly flat and evenly tensioned. Make sure that the teeth are properly dressed after swaging, otherwise they soon become dull, or the slender corners drop off.

The eccentric swage, in forcing out the corners, causes a depression or dent just under the points of the teeth. To face the teeth properly the fronts of the teeth must be ground sufficiently to take out most of this depression and to thicken the points to the required stoutness with which to stand the shock of cutting through knots without dropping corners. Swage just enough—no more—to get a dressing on the corners. If too much, the points will buckle when shaped. By compressing more than is necessary the points are apt to be injured, causing them, in many instances, to drop off. Therefore it is best to swage lightly and it will not be necessary to shape heavily.

When the teeth are all thoroughly swaged and

Fig. 101—Showing how every alternate tooth is tested

shaped, examine with a set gauge (see Fig. 100) to see if any are bent. Test by holding the gauge on each side alternately as shown in Fig. 101. If any of the teeth are out of line, bend them with a set wrench as shown in Fig. 102, to the right or left as may be required, until all are even. Extreme care should be taken to have all the teeth in perfect line, for any of the teeth, if even slightly bent, will cut roughly, and in passing through the board will naturally incline out of the cut, frequently breaking off.

After the teeth are nicely swaged, shaped, and straightened, the saw is ready for the automatic sharpener. Unless care is used in operating this machine all the good work just done will be spoiled. Bear in mind that the points are delicate. Do not try to get the work done in one time around the saw, but cut lightly several times until the teeth are well faced. This does not mean to take out all the depression made by the swage, but most of it. Of course, enough cutting must be done on the gullets and on the backs to keep the teeth in shape, and ground to point, as the automatic sharpener will keep the teeth even when all are brought up to the cutting edge. If they are not ground to point there will be high and low teeth.

Remember that too slender a tooth will cause chattering in the cut, and will make "wash-board" lumber.

Look after the sharpener frequently. Do not allow lost motion. Remember that emery dust will get

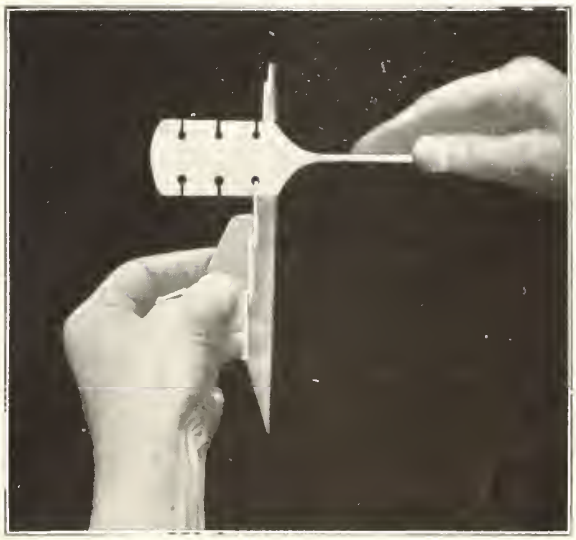

Fig. 102—Wrench for straightening bent teeth

into the running parts and cut. If this is not cleaned out the machine soon will be missing the teeth.

Grind the entire surface of the tooth and the gullet every time in order to present new steel to the work after each sharpening operation. Having each tooth in a band saw of the same width is quite as important as having them a uniform length.

Do not neglect your swage sharper. Examine it from time to time, after considerable use, to see if the dies are becoming worn by reason of the saw teeth frequently coming in contact with the same spot. If they are worn, then the swage on the teeth is not given sufficient back clearance to allow the side-dress to do its work without unnecessary friction. A saw with teeth improperly side-dressed will run "snakey." Keeping the dies in good condition and properly adjusted means a saving in labor and expense.

When a foreman cannot control his temper because things are not going as he wants them, it is time for him to consider whether he has not mistaken his vocation.

Bruce Wood Workers, Limited

Chesley, Ontario boasts a growing industry in the activities of the Bruce Wood Workers, Limited. This company was organized slightly over a year ago to manufacture wood products of various kinds and in particular to make extension table slides, bent rims for tables and table pins. Almost from the start these products have been in strong demand and they have been successful in developing a satisfactory volume of business.

The plant is housed in a bright, well-ventilated building, and includes such equipment as sticker, with special attachment for running the dovetailed

Table slides in process

groove in the table slides, jointer with power feed attachment, power feed rip saw, planers, automatic lathes, bending equipment and hardwood flooring machines. All material for the slides is thoroughly dried to preclude the possibility of warping and twisting and then trued up on the power feed jointer and run through the sticker. Every precaution is taken in both the initial manufacturing and assembling operotions to turn out a product that will give long service and lasting satisfaction. These slides are being marketed under the trade name, "Bruce Slide."

The rims produced are of the solid bent type. Stock is first run through the sticker, sized and one corner rounded. It is then taken to the bending department where it is steamed, bent and placed in special forms until dry.

The pins which are of the taper variety, are produced on an automatic turning lathe. From there they are put through a tumbler which smooths and polishes them. These are used in large quantities in the manufacture of extension tables, being used in the leaves.

A new departure, yet one that is proving successful, is the manufacture of hardwood flooring. Special equipment, which is in the hands of experienced men, was installed for this work. The usual run of widths and thicknesses in such woods as maple, birch, plain and quartered oak, is being manufactured.

In addition to these regular lines, special work of various kinds is continually going through. A considerable volume of business is being done with various automobile factories. Taking it all in all, this young organization appears to have a very prosperous future.

J. R. Shaw on Workmen's Compensation

J. R. Shaw, of the Canada Furniture Manufacturers, Limited, Woodstock, speaking before the Joint Safety Convention at a luncheon in Toronto recently, emphasized the advisability of having those protected by the Workmen's Compensation Act, contributing their share, of the funds required to carry out the provisions of the Act instead of the employers bearing the whole load. If this were done the worker would have a direct interest in the administration of the funds and would, on this account, be more inclined to make an effort to see that the money was properly distributed. This would have the effect of improving the application of the Act, for if the workers were more interested in the distribution of the money, they would take pains to see that their less scrupulous fellow-workmen did not malinger or in other ways make improper inroads on the funds. In certain European countries this policy is in force.

Mr. Shaw also quoted figures showing that 45% of all accidents occurred among agricultural workers. Recognizing this, insurance companies have classed farming as an extra hazardous risk. The rate for insuring a farm laborer is three times that for which a bank manager is insured even though the latter is exposed to all the hazards of city life, such as street cars, automobiles, elevators, etc. In view of this the farm worker should receive adequate protection and the farmers be brought under the working of the Act, the same as other employers of labor.

A strenuous protest was also registered by Mr. Shaw against those provisions in the Act which requires employers to include on the pay-roll for compensation purposes their office staffs and extra provisional staffs. These men are not exposed to the hazards of the industry and should not be included under the Act.

U.S. to Have "National Furniture Week"

At the annual meeting of the American Homes Bureau, held recently in Chicago, action was taken on the suggestion of having a "Better Homes Week" throughout the entire United States some time during October. The idea is to have a demonstration and special furniture displays in every city, town and village of the whole of the United States. Other features adopted at this meeting include a series of syndicated articles dealing with better furnished homes, including interviews, dealing with the home, from cabinet members, nationally-known educators and well-known clergymen; a series of moving pictures tending to teach the value of better furnished homes; text books for use in public schools, dealing with the science of home-making, interior decoration, color schemes, etc., and some work in connection with the "Federation of Women's Clubs."

It is anticipated that this "National Furniture Week" will be an outstanding event and will do much toward implanting the idea of better furnished homes in the minds of the American public.

Box Industry Must Reduce Costs

Extracts From Address by B. F. Masters at Twenty-third Annual Convention of National Association of Box Manufacturers—Gives Box Makers Food for Thought

It is pleasing to note from our commercial reports and from all sources that we look to for authoritative information in this respect, that there is some improvement in business. I have said before when my predications were not verified, but even so, I would much rather be an optimist and be somewhat disappointed than to be a pessimist and contribute to somebody else's disappointment, because the entire situation in the country to-day with respect to business is not a fundamental trouble but a question of uncertainty of mind, a mental depression if I may describe it that way. The most recent reports that I have had access to indicate that basic commodities are gradually gaining. Steel products, particularly railway equipment, is manifesting considerable strength. Scrap iron may be different. But copper is stronger and the basic metals are stronger and even when you come down to the products that we use, the latest reports that I have seen predict that we have reached the bottom of prices and that lumber cannot be manufactured for the prices at which it is sold to-day and that inevitably one of two things must happen: Costs must be reduced, or manufacturers of lumber will quit manufacturing.

Improve Quality Service

What I have said of lumber is probably true of every industry. It is true of our own industry. I think I may safely say that many of the manufacturers whom I am facing to-day have been conducting their business more upon the hope of the future than upon the profits of the present. I congratulate anyone in our industry to-day who can say that they are making a reasonable profit on their operations. I think we are still in that period of liquidation when we must face the conditions that I have referred to and that it is a question of waiting and holding our trade, giving service, taking care of that which we have and not attempting to stimulate a demand that doesn't exist by quoting low prices that mean ruin to the manufacturer and disappointment and uncertainty to the buyer.

The volume of lumber movement is on a much higher level than a year ago. If that be true, and I have no reason to doubt it, we have no fear of an abundance of raw material for our use. Whether the price may be lower or not seems to me to be of less importance than any other problem we have to meet. My experience, and my observations also, are that our industry is more profitable and is more easily conducted and is less competitive when you are paying a high price for lumber. That is an incongruous suggestion in a way, and I don't mean that we should endeavor to stimulate the advance in the price of lumber, but our business is so closely related to the lumber business and the lumber market that whenever there is any weakness in lumber it is immediately reflected in the product we manufacture, because a great many and probably a majority, in point of production, of the sawmills of the country have shook mills in connection with their operations whose product they will sacrifice much more quickly than they will sacrifice the product of their mill in commercial lumber, due to the fact, perhaps, that a great part of the product that they sell in competition with us is manufactured out of what would otherwise be waste. Short lumber and mill trimmings and low grades of stock which they can cut up at the mill to a better advantage than it can be manufactured into boxes or shooks at some point more remote having to bear the freight rate, the transportation rate on the original character of lumber without the elimination of waste.

To offset any improvement that may have manifested itself up to date, I am going to be a pessimist just for a minute. To offset all this, there are many lines of industry that have not liquidated and I scarcely know what order to take them up in, but I think the retail stores and labor are the two most important. Absolute liquidation in the matter of labor means that every man is working for what he's worth that there is competition for his job and no man can expect to inflate that position and get more than he is worth by any artificial means. The question of supply and demand, the question of his efficiency and the real value of his labor to industry is what he ought to get! Labor must be liquidated, along with some other commodities.

Importance of Cost Reduction

In the past we have sometimes talked about the possibility of improving the condition surrounding our industry by various means, such as advertising (which is commendable and which I heartily approve of,) co-operation (which is commendable but which is somewhat artifical and therefore very often futile) the real essense of what must be accomplished in our industry and every other industry is to do, I will say, two things: Reduce the cost of the product that we are selling, and use a little better judgment in the methods and manner of marketing that product.

Fundamentally, the thing true in every industry as I see it, is the lowest possible cost of production, and that must be brought about by intelligent means. It can't be brought about by co-operation. Sometimes sales may be influenced by co-operation, but back of it all no man is happy who can't make his product as cheap as his competitor. He is not happy neither is he safe, because this period of liquidation and restoration of basic and fundamental principles means that the man who can't make his product as cheap as the other fellow is hopelessly lost before he starts.

There may be some advantages that some of us have that others do not share, but my observation in the past twenty or twenty-five years in the box industry (and I am talking to box men now) is that when you analyze the fundamental conditions surrounding every man's business, you find that we are all very much in the same boat. You have one man beat on one thing and he has you beat on something else and the essence of the business propositions today is to combine all the most efficient methods of

manufacturing, put into effect all the most economical features of production, the best efforts of selling your product. Co-operation is necessary in that. The fundamental adoption of your cost is the thing that is going to count in the future of the box business, as I see it, and in saying that I don't mean that the cost of lumber which will reduce the cost of your boxes is the important thing. It means and is important in connection with the selling of our product in competition with substitute packages (and I still call them substitute packages); it does help you in that, but 75% of the competition that you men meet is not from the extraneous packages or extraneous conditions or circumstances or competition,—it is from within. Maybe you don't agree with me on that it is at least 75% from within.

Is Vital to Future Industry

What I have in mind is that the future of the box industry, whether made up into boxes locally or shooks or whatever it may be, that its perpetuation puts up to the manufacturers, the importance of producing the product that you sell at the very lowest cost of production. I don't mean that you have been extravagant and that you haven't done that. Maybe you have, but I do know that we haven't all liquidated. We haven't all come down to the very finest point and reduced our expenses to the point where it may hurt, may have hurt ourselves, may have hurt our organization, may have impaired our efficiency to some extent in that we have been obliged to say to men in our employ that "under these conditions it becomes absolutely necessary for you to share in the necessary reduction in costs in order to perpetuate this industry."

I know some men—and I love them and admire them for their thought—who say "I can't reduce the wages of some of my men who have been with me for years." I don't want to make any suggestions as to that, but if you can't reduce your cost some way or other, my thought is that you are hopelessly lost and that this industry is going to fail except as to those that will and can reduce their cost. Because we are approaching an era, we are already in a period when everything that is sold, must be sold and is expected to be sold and should be sold at a lower price than it was two or three years ago. Of course, you may say that boxes were sold at half what they were two years ago. Has your cost gone down half? The cost of your material may have gone down half, and to my mind that is the underlying thought that every manufacturer should keep in mind—that he must get his cost of production down in order to perpetuate his business.

Overhead is the whiteman's burden, and us white men have been having to bear it for a number of years. Overhead, ever since business began to decline two years or a year and a half ago, has been the one bugaboo that has put a lot of us on the down grade. You can't reduce your overhead automatically just by a wave of the hand. You can't do it without some very stringent measures at times. This is the thought I have in mind—the survival of the industries whether in the box business or lumber business, whether in manufacturing lines, steel, hardware, clothing, whatever they may be, these basic industries are coming to the point where they see that the perpetuation of their business is very closely correlated with the cost of production and that the reduction in cost is the only safe thing, the only sure means by which they can perpetuate their business.

Insist That Wooden Box is Used

I think it is a shame that any man in the Wooden Box business ever buys anything from anybody to be shipped anywhere without specifying that it must be shipped in a wooden box, and a lot of us do it.

We are all in the same business and in the same boat in the same storm. We are all depending upon the same natural resources for our basis of supply. We are so closely related to the lumber business that the lumber manufacturers look on us and expect us to use that part of their product which is not usable, to a very great extent, for any purpose.

The next step we should take is to impress upon every lumber manufacturer the thing that I have just stated here. We started a campaign of this sort at one time and did a lot of work and we had every lumberman in the country stamping on his orders "This must be shipped in a wooden box," and sometimes "made by————." You can leave that off if you want to.

Putting Up New Factory

J. Walter & Sons, Kitchener, Ont., manufacturers of carved wood fibre ornaments, are erecting a new plant, which is taking the form of a two-storey building, 100 x 200 feet. The capacity of the new factory will be three times that of the old plant, and it is anticipated that employment will be given to, at least, 75 hands. From 25 to 30 are being employed to-day.

One reason for this new development is that this company has been able to work up an unusually large export trade. At the present time about 50% of their output goes overseas, shipments being made to England, Scotland, Ireland, Spain, Germany, France, Belgium, Holland, South America and South Africa. The bulk of the export business, however, is with Great Britain. It is the intention to add several new lines.

The present personnel of this company is,—President and manager, John Walter; vice-president, Edward Walter; secretary-treasurer Arthur Slumkofski, and head designer, Fred. Schmidt.

Millwork Cost Bureau Convention

The Millwork Cost Bureau, of Chicago, held their Eighth Annual Convention at Chicago on April 19th and 20th. The attendance was equal to that of former years but there was a marked increase in the interest and enthusiasm displayed by those present.

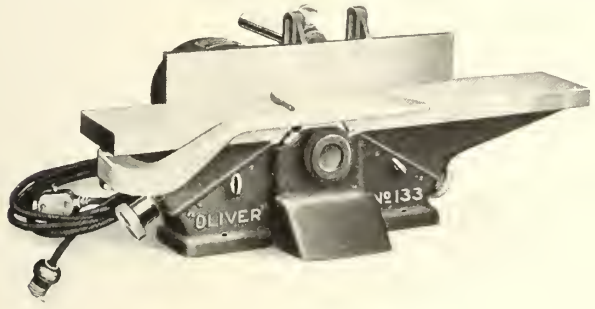
The work for the past year was reviewed by the secretary, W. P. Flint. His report showed that during 1921 the membership had been increased by the addition of 37 new concerns. A number of new services had been put into effect, including "supervision of cost recording," "new correspondence course for estimators" and the "group lecture service."

A number of interesting and practical addresses were delivered, some of the subjects being "Credit Terms and Discounts;" "Should the Special Millwork Plant Buy or Manufacture its Stock Millwork?" Operating the M.C.B. Cost System;" "Proper Mill Equipment and Arrangement;" "Estimators' Clubs and Their Function," and similar topics.

Machinery & Equipment

Portable Hand Jointers

A New portable hand planer and jointer is shown in the accompanying illustrations. This is a product of the Oliver Machinery Co., of Grand Rapids, Mich. This equipment was produced to meet the demand for a compact, motor-driven planer and jointer to relieve the bench hands of an immense amount of hand-planing and hand-fitting. The machine is made for either belt or direct motor drive. In the case of the motor-driven jointer, the motor is connected directly to the shaft or cutting cylinder of the jointer. The bearings are equipped with ball bearings and are carefully guarded and protected from dust and shavings. These machines may be had in either 4 or 6 inch seizes and may be used on the working bench itself or may be mounted on a special floor pedestal. The tables are mounted on incline dovetailed ways and are raised and lowered by means of hand wheel and screws. Provision is made for locking the table in any position. The fence, which is capable of quick adjustment, can be tilted to an angle of 45 degrees and may be shoved out of the way for jointing or



Oliver portable bench jointer

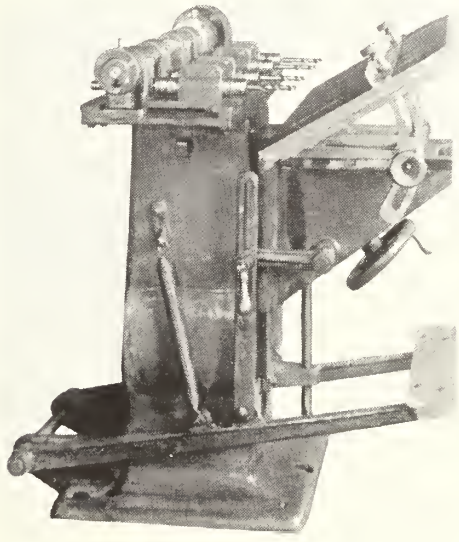
setting the knives. The cutter head is a three-knife circular safety head, fitted with Tungsten Chromium thin steel knives. Cutting diameter of these heads is 3½ inches. The machine is built on a rigid one-piece frame and is so designed and constructed to give long and satisfactory service.

New Horizontal Boring Machine

The horizontal multiple spindle boring machine as illustrated was recently placed upon the market by the Valley City Machine Works, Grand Rapids, Mich. It is built upon a single column and is self-contained, insuring absolute accuracy and ease of adjustment. The half tone clearly shows the adaptibility of the machine to variable center distance, variable depth with equal length bits as well as angular boring. The minimum center distance is 3-1/8" and the maximum 24". The spindle units are self-contained and integral, having hardened spiral gears which run in an oil reservoir. This eliminates any adjustment when changing center distances. These units are equipped with ball thrust bearing spindles in adjustable quills.

The horizontal driving shaft is mounted on three radial ball bearings. The driving pulley can be placed on either end and can be belted from any point around the circle. The number of spindles can be varied to suit requirements and they can be fitted for any type of bit.

The feed is actuated by the treadle counter-bal-

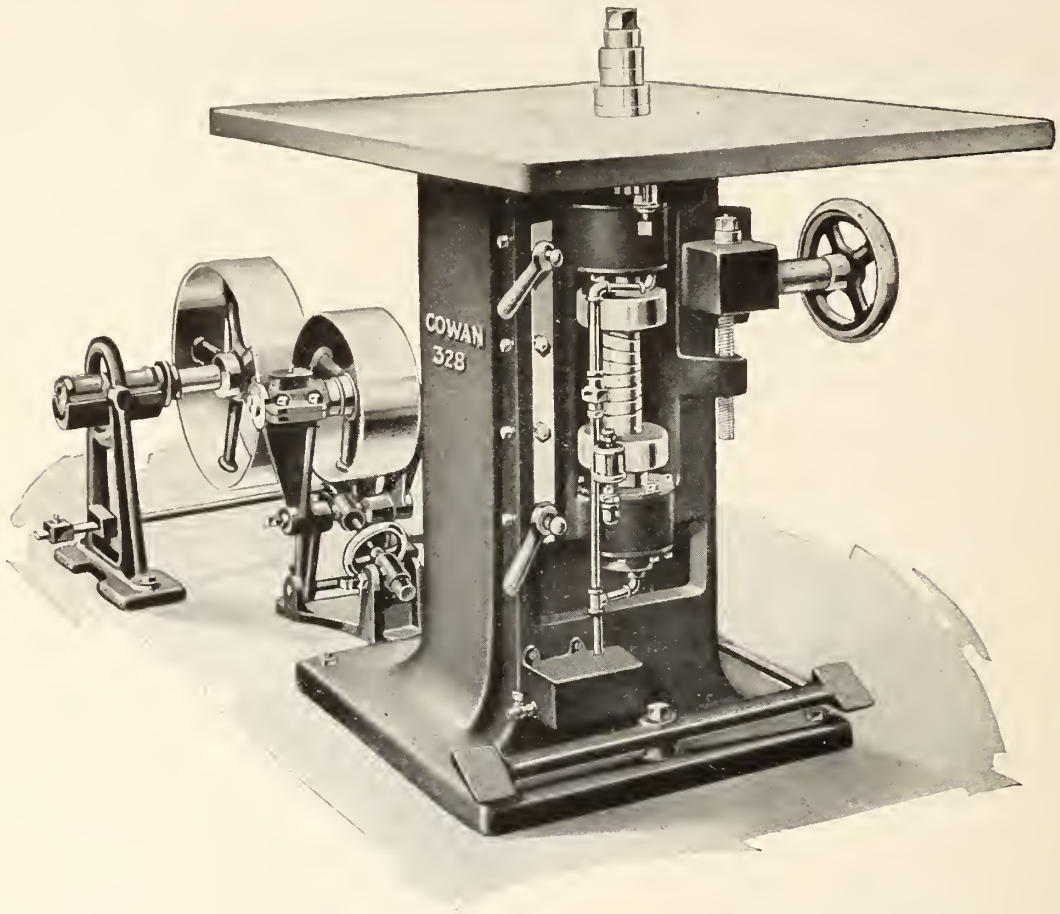


New Multiple spindle horizontal boring machine

anced by the retractile coil springs which gives a quick sensitive response with a minimum of movement and exertion. The table is 16" x 40" and can be fitted with various fences or work-holding devices to suit customer. The machine occupies a floor space front to back of 36" and left to right 44". Weight about 1,200 lbs.

New High Speed Shaper

Cowan & Co., of Galt, Limited, Galt, Ont., recently placed a new ball bearing shaper on the market. This is shown in the accompanying illustration. It is designed to run at a speed up to 12,000 R.P.M. and the frame and construction has been so worked out as to insure rigidity and freedom from vibration. The frame itself is a heavy cored casting, having a wide base supporting a table 32 x 30. A removable throat plate 6 inches in diameter surrounds the spindle. Raised rings or non-friction guides of any diameter can be supplied to replace this throat plate. The spindle itself is of 2 1/8 inch tool steel, turned down to 1 1/8 inch above the shoulder, and is accurately machined and balanced. It is located 16 inches from the front of the table. Bearings are S.K.F., ball bearings and are specially selected for their suitability to this work. They are dustproof and provided with an up-to-date oiling system, having sight feed oil cups. The bearings are independent of the spindle and can be readily removed. The yokes carrying the bearings are heavy and hold the spindle steady and in line. They are raised and lowered in long slides by a hand



High speed ball bearing shaper recently placed on the market by Cowan & Co., of Galt, Limited, Galt, Ont.

wheel and can be locked in any position. Motor drive can be used by belting from motor direct to spindle, using an adjustable belt guide stand. From 2 to 3 h.p. are required to drive this shaper.

All Steel Factory Trucks

What might be considered a decided improvement in factory trucks is the all-steel truck manufactured by the Globe Vise & Truck Co., Grand Rapids, Mich.

View in Brunswick, Balke, Collendar plant showing all steel trucks

The accompanying illustration shows a number of these trucks in the plant of the Brunswick-Balke-Collender Co., at Muskegon, Mich. This is only a few of the 3,300 Globe "metal-light"steel trucks to be found in this large factory. The truck itself is made of blue annealed steel, the top and sides being 14-gauge and the ends 12 gauge. A centre rail or brace which is not visible extends from one caster to another to give greater rigidity and strength. All trucks are fitted with the removable hardwood stakes. One feature of a truck of this kind, that is of unusual interest is that with the smooth steel bed, there is nothing to mar the stock. Sometimes in the case of the home-made truck, the nail heads project above the level of the truck and cause a considerable amount of damage to stock in the course of a year.

Mark Twain on Advertising

Mark Twain in his early days was editor of a Missouri newspaper. A superstitious subscriber wrote him, saying that he had found a spider in his paper, and asked whether that was a sign of good or bad luck. The humorist wrote this answer and printed it:

"Old Subscriber: Finding a spider in your paper was neither good nor bad luck for you. The spider was merely looking over our paper to see which merchant is not advertising, so that he can go to that store, spin his web across the door, and live a life of undisturbed peace ever afterwards."

Upholstering and Trimming

Treatment of Arms and Wings

When not Provided With Removable Panels Resort Must be Made to Welting and Banding

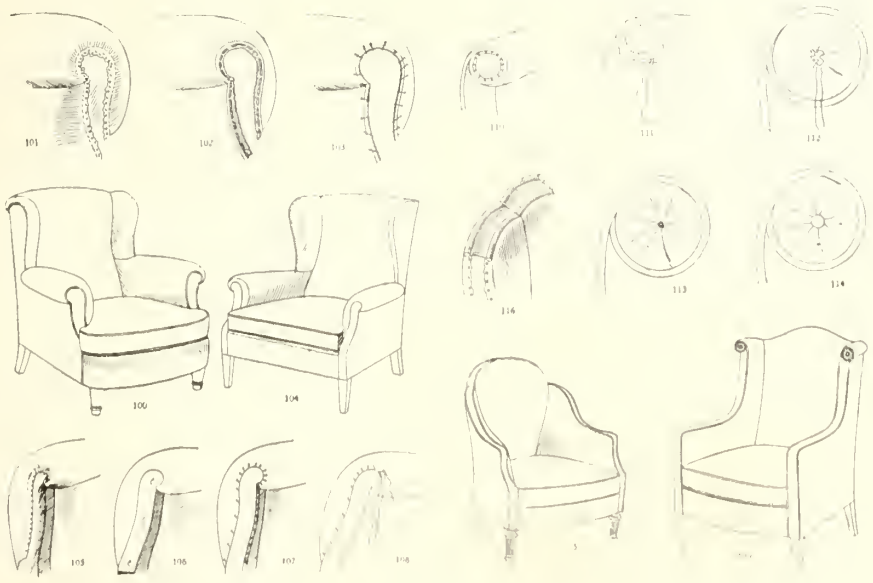
The chair last described in this series, which is being reprinted from the "Upholsterer," was constructed with removable wooden panels, which simplified the finishing of the arms and wings. We now illustrate several styles which, not being provided with removable panels, must be treated in the ordinary way of welting and banding.

The chair shown as Fig. 100 is of the luxurious type, the arm of which is finished with a double welted panel. The welt in this instance outlines the panel and is put on after the outside lining has been attached. Futhermore, the panel is slightly larger than the woodwork of the face of the arm. Fig. 101 shows a double enlargement of the arm, which is the right arm of the chair (as the chair faces the observer it appears at the left of the illustration) with the shape of the woodwork indicated by a broken line.

The welt sewn into place is shown in Fig. 102 following the shape indicated by the outline of the woodwork, but sewn to the upholstering and to the cloth of the outside lining. In order to get the proper shape for this welt, an outline is sketched on the upholstering in chalk, with or without a pattern, and the welt, which has already been stitched by machine, is sewn into place, as indicated. A piece of the covering is then pinned into position within the welt and blind-stitched into place, as indicated in Fig. 103. In the case of a very large welt and a heavy fabric, it is well also to blind-sew around the outside of the welt in order that it may be kept flat and shapely.

The arm shown in Fig. 104 is finished without a welt, a treatment sometimes desirable with a heavy plush fabric. Fig. 105, enlarged to double size, shows the contour of the upholstering of the left arm and the shape of the face of the arm is indicated by a dotted line. Fig. 106 shows the pattern attached to the face of the arm for the purpose of outlining the shape of the panel and a pencil or chalk line is drawn around the pattern where the panel is to be sewn. The panel is next pinned in place, Fig. 107, the outside edge is tacked on the outside arm where it will be covered by the lining and the outline of the panel is blind-sewn where pinned, as indicated in Fig. 108.

A different type of chair having a continuous wing and arm which is treated on the face with a double welted band ending at the top of the wing in a gathered rosette is shown in Fig. 109. The welt, which follows the shape of the wing and the outside arm, is put on after the chair has been upholstered to this stage, and is carried around the circle of the roll, which finishes the top of the wing, as indicated in Fig. 110. The rosette which finishes this circle is the last thing to be put in place, therefore, the band which forms the panel on the face of the wing



Details showing how arms and wings may be finished

and arm is put on so that the welt which follows the circle in Fig. 110 comes over the band.

The band, at this outer edge, is tacked around the edge of the frame where the lining comes on the top of it, making a finished edge, as shown in the illustration. The fabric for the rosette may be either tacked or sewn into place, as indicated in Fig. 111, in either case it is imperative that it follow closely the inside edge of the welt as no other trimming comes between the outside edge of the rosette and the welt.

A gathering string is threaded through the flat edge of the fabric which composes the rosette and drawn tightly together, gathering the fabric into a close knot and completed by a button, as shown progressively in Figs. 112, 113, 114. Fig. 115 shows the type of chair which may be trimmed by a double welted band mitered at the angles to fit smoothly and blind-sewn on both edges, as indicated in Fig. 116, to make the finished trimming. It will be obvious that in order for this type of trimming to be effective, it must be very neatly made with welts that are absolutely parallel and neatly applied in conformity with the shape of the upholstering and the outlines of the chair. It is illustrated here not only as the only method of trimming for the chair shown, but as an example of a treatment which may be applied to this type of chair and to others of a similar shape where one continuous band may be used for the back and arms.

What is Your Reputation Worth?

S. Karpen & Brothers Find That Integrity and Reputation of Manufacturer Biggest Factor in Selling Upholstered Furniture—Dealer Forced to Rely Upon Honesty of Producer—Every Effort to Maintain Quality

In no class of furniture does more depend upon honest and thorough factory methods than in the making of upholstered furniture. The integrity of the manufacturer is a big and commanding element.

So much of the quality of upholstered furniture depends upon factors that are not visible to an outward inspection, that this dependence upon the manufacturer looms larger and larger upon deeper consideration. Beneath the covers of upholstered furniture there must be an honest construction all the way through. Otherwise, no matter what may be the attraction of outward appearance, the davenport or chair will not be satisfactory in use and service.

Value Lies in Honest Construction

A trip through the mammoth departments devoted to the manufacture of upholstered furniture at the great factories of S. Karpen & Brothers is a demonstration in the right kind of factory methods that produce that Karpen quality which stands for so much in the furniture industry. Observation of operations in these departments emphasizes the statement that the value of upholstered furniture lies in its honest construction in every part. Expert workers are seen busy at their particular tasks and the constant and exhaustive inspections of every operation makes perfection absolutely sure.

Somehow, there appears to be an especially noticeable degree of craftsmanship and pride in work among the men and women in these departments. It seems that these workers realize the importance of their work and their work gains that indescribable quality that comes only from true appreciation of the importance of good craftsmanship.

One pauses in the department where the frames are constructed, his attention held by the precision with which the work is done. A sturdy, strong and inflexible frame is the foundation of the davenport or chair and without a perfect frame all the embellishments would be lost effort. The frame must be right, there can be no compromise of any kind.

Every Detail Must be Considered

The value of an upholstered davenport or chair lies largely in the way the springs are put in and the manner in which the materials that make it soft and comfortable are placed in position. At first glance one judges an upholstered chair or davenport by its appearance, but the final judgment of its worth comes only after one has sat down in it and measured its comfort. This comfort, and how long the piece will possess this comfort, are determined in the departments where the springs are put into place and where

ENAMELS and UNDERCOATS

Marietta Enamels are made in any grade desired to suit the requirements of any customer.

Marietta Undercoat possesses the following qualities:

Extreme fineness.
Easy flowing properties.
It is long in oil.
It will not peel.
It dries hard over night.

Liquid not paste—consequently sprays well, enabling the sprayer to cover more surface in a given time.

Samples to furniture manufacturers on request.

Why Filler is Applied

Does More Than Fill Pores—Points to Consider in Selecting Your Filler

By A. J. Wright*

The use of wood filler has two purposes. First, it fills the pores of the wood and builds up a level surface to receive the following coats. Second, it brings out the beautiful workings that nature has made in the wood. While the furniture manufacturers have been striving to bring out new styles and designs, the filler manufacturers have been endeavoring to develop their fillers to take care of the demand for new finishes.

Filler can be obtained either with or without stain combined. That is transparent fillers or stained fillers. By transparent I do not mean natural filler but fillers in oak, walnut or mahogany. For light-grade work, much better results can be obtained by first staining the wood and following with a filler of the corresponding color. The stain should always be darker than the filler or the filler is apt to give a milky cast. In selecting a filler it should be borne in mind that there is a wide difference in fillers. The best filler is made from selected silex, that is, a silex obtained from crushing crystal quartz. This is a much finer grade of silex than in ordinary use, due to the fact that it is clear and does not throw off the shade of the coloring. In addition this silex is needle-like in structure and packs into the pores of the wood very readily. The green tone sometimes seen in natural oak finish is caused entirely by the fact that the silex is not clear.

The most important part of a filler, however, is not the silex, as silex has been used in making filler for years. The liquid portion of a filler can spoil the best silex obtainable and make a very poor filler. The most common complaint in fillers is shrinking in the pores of the wood after varnish has been applied, and this is caused by the vehicle not drying hard to the bottom of the pores before the surface is finished.

The drying of a filler depends on the Japan used. This is not an ordinary Japan but a special piece of goods developed for this class of work. A filler should dry hard in the pores of the wood in twelve hours instead of only on the surface. It should be made soft and should not be thinned any more than is necessary to work it properly.

If the veneer is running good, one filling thoroughly rubbed in is sufficient. However, if the filling department is on a piece work basis, it is advisable to fill twice to insure proper filling. A wash coat of shellac applied before the filler makes a good foundation for the filler as it stops all absorption by the wood.

When a shipment of filler is received, always try it out before putting it into production, as a great deal of expense can often be avoided in this way. The filler may not suit the stain you are using and one or the other will have to be changed. In examining a test of filler, always hold it in the direct sunlight. This is essential in the case of mahogany as cloudiness does not always show in the ordinary light of the shop. A good filler makes a smooth even surface for the varnish coats. Great care should be taken to clean off the superfluous filler on the wood.

While the filler emphasizes the markings in the wood and makes visible tracings that would not otherwise be seen, at the same time it also makes any defects stand out prominently. These, of course, can be taken care of in the shading.

It is strongly recommended in obtaining filler to secure it from a manufacturer who understands the requirements of the furniture trade and whose filler receives the proper supervision both as far as the raw and the finished materials are concerned.

*Flint Varnish & Color Co., of Canada, Limited, Toronto.

Overhead Carriers in Finishing Room

One trend of development in finishing room equipment is toward overhead carrying systems for moving the stock through this important department. This applies particularly to plants who handle a large volume of small parts. By installing overhead tracks having suitable carriers, the small parts may be hung on racks and moved from one operation to another with a minimum handling and effort. In addition considerable time is saved in performing the various operations. In one plant an overhead track was dropped so that it ran into the spraying booth and the varnish applied to the pieces while they were hanging from the carriers. This meant quick work, for the operator did not have to handle the articles at all.

Another feature worthy of mention is that the pieces have a better opportunity to dry when they are suspended from the ceiling in this manner. It gives the air a chance to circulate freely about each piece, resulting in quick uniform drying. If varnish-drying kilns are used, the tracks could run right through the kiln and the work be put in and removed with a minimum of labor.

Finishes in Strong Demand

At the furniture exhibition recently held at Evansville, Ind., the two most popular finishes for dining room furniture were dusty oak and dusty walnut. It is stated that the manufacturers in that district were unable to produce stock in these two finishes fast enough to take care of the demand. Next to the dusty finishes, furniture showing a combination of shades was, probably, the most popular. This latter finish, which is sometimes called "duo tone," seems to be fast gaining in public favor. This holds true, not only of the Evansville market, but applies to all American furniture centres. Solid walnut bedroom furniture was another line which found great favor on this market.

Checking Volatile Thinner in Oil Varnishes

Describing How Percentage of Various Thinners in Oil Varnishes May be Determined

S. W. Stratton*

Almost all oil varnishes (varnish containing lined oil and rosin) as thinner, gum spirits of turpentine, "mineral spirits," (petroleum distillates) or a mixture of the two. Most of the turpentine substitute prepared for use in paint and varnish are made from mineral oil. Benzene ($C_6 H_6$) carbon disluphide, alchol, and wood turpentine are very rarely used for oil varnish, though wood turpentine is frequently used in the manufacture of driers.

The definition for "volatile thinner," proposed by committee D-1 of the American Society for Testing Materials, is as follows: "All that liquid portion of a paint, water excepted, which is volatile in a current of steam at atmospheric pressure.

Since there has appeared no published work in which different methods for the determination of volatile thinner have been compared by the analysis of samples containing turpentine and of samples containing mineral spirits, this investigation was undertaken in order to ascertain the accuracy and convenience of the different methods.

Collection and Preparation of Samples

Two samples of varnish were obtained from a reliable manufacturer, one being made from rosin, linseed oil, Chinese wood oil, driers, and "mineral spirits," and the other from a hard gum, hardened rosin, linseed oil, Chinese wood oil, driers, and turpentine. These samples are subsequently designated as A and B, respectively. An example of the distillate obtained from B showed that it contained a very small amount (about .2 per cent) of "mineral spirits." Two samples of varnish were prepared in the laboratory, the nonvolatile portion of both consisting of approximately equal parts by weight of calcium resinate (prepared by heating rosin with 5 per cent of its weight of slaked lime) and boiled linseed oil (containing lead and manganese.) In one case the thinner used was turpentine, and in the other light mineral oil. These samples are designated as C and D, respectively. Examination of the distillates obtained from A and B and of the thinners used to prepare C and D gave the results shown in Table 1.

Table 1

Results of Examination of Thinners

Material	Specific gravity at 15.6° C.	Refractive index at 20° C.	Unpolymerized residue %	Refractive index of unpolymerized at 20° C	Initial boiling point °C	90% distilled at °C	95% distilled at °C
Pistillate from A	0.763	1.423			119	173	187
Distillate from B	.864	1.470	2.5	1.473			
Thinner used for C	.869	1.471	1.2	1.513			
Thinner used for D	.761	1.425			118	178	190

*Bureau of Standards, Washington, D.C.

The distillation was made with an, Engler apparutus.

The light mineral oil that was present in A and D is fairly representative of mineral-oil varnish thinners.

Different Methods Used

Four methods were used for the determination of the amounts of volatile thinner in A, B, C and D.

Method 1. — A steam distillation was made, using 100 g of varnish, the still containing the varnish being heated to 115-120 degrees C in an air bath. The distillation required from one and one-fourth to one and one-half hours and the volume of water condensed varied from 550 to 700 cc. The distillate from the varnish was separated from the water and weighed. The "corrected" results (see Table 2) were obtained by adding to the weight of the volatile thinner 0.3 g for each 100 cc of water condensed.

Method 2. — Approximately 1 .5 g of varnish were placed in a stoppered glass vial and the vial and contents weighed. The varnish was poured into a weighed metal dish, having a circular flat bottom 8 cm in diameter, the stopper was replaced, and the vial and stopper weighed. The dish was heated in an air bath at 110-115 degrees C until no further loss in weight occurred. The maximum time required was three hours. The loss was assumed to be volatile thinner.

Mthod 3. — Brown's method, with A and B a mixture of ether and chloroform was used, but C and D dissolved readily in ether. The films obtained were very uneven, being thickest at the edges of the plates. The plates were placed in a dust-free glass-walled cabinet with free access of air. The plates were weighed at intervals until no further loss occurred. The maximum time required was three hours. The loss was assumed to be volatile thinner.

Method 3a. — This was the same as Method 3, except that the plates were kept in a current of illuminating gas. The maximum time required was three hours.

Determination of Thinner in Varnish

Method 4. — A small stoppered vial containing about 1 g of varnish and a small camel's-hair brush were weighed together. The contents of the vial were poured upon a weighed glass plate, 10 by 15 cm, and brushed out to a thin film. The stoppered vial and brush were then weighed. The films of varnish weighed 0 .6 to 0 .9 g. The plates were allowed to stand in the cabinet used for Method 3 and were weighed at intervals until no further loss occurred. The first weighing was made at the end of two hours and subsequent weighings showed that no further loss occurred in any case. The loss was assumed to be volatile thinner.

The temperature of the room during the determinations by Methods 3, 3a, and 4 varied from 30-35 deg. C. The results obtained by all methods are shown in Table 2.

The uncorrected results obtained by method 1

and those obtained by methods 3, 3a, and 4 are all as concordant as can be expected. It was also to be expected that slightly higher figures would be obtained by method 3a than with method 3. The percentages of volatile thinner in C and D obtained by method 1 (uncorrected) and by methods 2, 3, 3a and 4 are but slightly less than the amounts actually present and the corrected results by method 1 are but slightly greater. It appears, therefore, that for such varnishes the most convenient method may be selected for routine use. During the application of varnish the thinner is rapidly evaporating, so that for practical purposes an error of 1 per cent in the determination

Table 2

Results of Determination of Volatile Thinner by Different Methods.

is of no significance. In this laboratory method 2 is used, the result being reported as the whole percentage next above the figure obtained. Should the steam distillation method be used, with subsequent correction of results, the percentage of volatile thinner should be reported as the whole percentage next below the figure obtained. In the examination of samples of interior, floor, coach and spar varnishes panel tests and drying tests on glass are made separately instead of in connection with the determination of volatile thinner as is suggested by Brown. The distillate obtained by steam distillation of an unweighed portion of the varnish is used for the determination of the nature of the thinner.

The practically complete volatilization of the thinner in a short time as obtained in the determinations by method 4, indicates that with such samples it is highly improbable that the nature of the dried film, or the rate of drying, is influenced by the nature of the thinner. These samples, however, were analyzed shortly after preparation, while some varnishes of high quality are aged, sometimes for years, before being marketed. In aged varnishes it is probable that turpentine changes so as to yield nonvolatile material, which remains in the varnish coat when the film dries. The changes in the volatile thinner contents of varnishes on aging is under investigation in this laboratory.

Building Actively Continues to Increase

The building industry in Canada continues to forge ahead at a very gratifying rate. This is particularly true of residential work. The figures for April 1922 indicate that the value of the contracts awarded for residences during April totalled $12,472 00. The significance of this is seen by comparing this amount with the figures for recent years which are,—April 1921, $9,000.000.; April 1920, $6,500.000.; April 1919 $3,000,000.

This building boom, if such a term might be used, is responsible for the large volume of business being handled by the sash, door and planing mills. Many of these plants are operating to capacity and are unable to take care of the volume of business being offered. By fall the beneficial effects of this situation should be felt by the furniture manufacturers, and it should go a long way to placing production in furniture plants on a basis which more nearly approaches normal.

The trend of building costs is slightly downward, which may be taken as an indication that the activity in the building field will increase from month to month rather than show signs of a decline.

Utilizing Box Factory Waste

There is considerable waste in the production of boxes and box shooks, and in order to utilize this to the fullest possible extent, the Pacific Box Co., Vancouver, B. C., has developed and equipped an up-to-date pail factory. All the short ends of box stock not available for boxes, are sent to the pail-making machines. The stock for the staves is grooved out then taken to the jointing machine where it is jointed and tapered so as to give the correct flare, together with the required top and bottom diameters. After being jointed, the staves are cut to length and placed on a setting-up table where they are set up in the form of a circle and one hoop put on. The next operation is turning off the outside of the rough pail and sanding it to a smooth surface. A groove is also cut in the inside near the lower edge to take the bottom of the pail. While the staves were being made and assembled, other machines were busy turning out the bottom pieces. After the outside has been turned and smoothed, the pail is put on another lathe and the inside dressed up and the bottom put on, then a second hoop is put in place.

These hoops are made of wire and welded together. A piece of wire of the proper length is bent in a rough circle and the ends are placed close together in a device fastened to a suitable bench, and are held in place by a pair of clamps. An electric switch is then thrown in and the ends of the wire become white hot and welded together, making a solid band.

From then on it is just a process of finishing and attaching the bales and handles. In some cases the outside of the pails are varnished whereas for other commodities they are required in the white. There is also a difference in the tops and fastenings used, depending altogether on the material for which the pails are intended.

When you wish to put down a machine close to the shafting so it is a very short drive, don't use a belt, use a chain.

Labor Turnover Costly Item

Labor turnover represents a definite, though not easily calculable loss. This loss is made up, in part at least, as follows:

(1) The clerical cost in incident to firing and replacement.

(2) The cost of training newly hired employees.

(3) The wasteage, breakage, and so on, attributable directly to inexperience.

(4) The maintenance of idle machinery and equipment while separations are being replaced.

(5) The decrease in the general efficiency in the organization due to the constant state of flux in the working force.

(6) The tendency on the part of new employees to increase the frequency and severity of accidents.

Does a saw cut better with teeth ½ in. from point to point, or 2 in. from point to point? Speed of saw 9,000 on tooth.

Belts run on machines with automatic belt tighteners do not require any dope, but attention that the strain put upon them does not injure the bearings.

Some mill floors remind one of obstacle races. Sacks, short ends, sawdust and chips, are only a few of the items the men have to get over to do their work.

Some old-time machinist would have welcomed the no belt machine. They spent a lot of time patching up old belts.

The machine that can make two holes with one operation instead of one is lowering labor and power costs.

The art of making a saw cut so it will leave the end of a block perfectly smooth is entirely different from that of sharpening a log band saw.

Will the tendency in the future be in the direction of joining various machines so that the woodworking process on an article is a continuous one?

Several of the latest safety guards over the cutter blocks of surface planers seem to be very effective and very useful in aiding the operator to turn out good work.

Some men are so thorough in their work that, if the knife on a 24 in. planer come across a nail, they will grind those cutters down so that the gaps made by the nail are gone. Don't waste metal like this, shift the cutters so that each cutter regulates the other.

We saw in a trade paper a suggestion that small band saws should be hammered on the back so that the strain should come on the front. May we suggest that if you want to use those saws to be careful with such hammering. Small band saws are easily spoilt.

In cleaning out a boiler, if a good packing is used for making the manhole joint it can be used several times if care is taken when breaking the joint.

Considering the small amount of extra cost and the lengthened life of a belt, we wonder why so many men will cut down the width of the belting just to save a few cents.

Horizontal band resaws seem to be very effective and up-to-date machines.

when the gullet of the teeth of a saw is not large enough to carry the dust it packs against the wood and the saw.

Burden as Factor in Lumber Cost

A woodworker was recently asked what lumber costing $50.00 per M should be sold at to bring a profit of 10%. His reply was $72.60. He went on to explain that in arriving at this figure, he added $5.00 per M for lumber burden and then an additional 20% to cover the commercial burden, which brought the total cost of the lumber up to $66.00, and then by adding 10% for profit it made the resale price $72.60. This woodworker intimated that sometimes a serious error is made by not adding all cost items, such as overhead and handling charges before calculating the profit percent.

In selling this stock at $72.60, he is not making 10% on the resale price but only 10% on the cost price. To make a profit of 10% on an item of this kind, it would be necessary for him to sell the stock at $73.33.

Repairing Dents in Finished Surfaces

Sometimes the finisher is called upon to repair damaged spots on veneer surfaces. If these take the form of dents, it is advisable to soak them with warm water so as to swell the wood before applying any form of filler. After the spot has been soaked and the moisture has had a chance to dry out, then the hollow may be filled with some form of crack filler such as stick shellac and the finish proceeded with in the usual way.

Profits often arise from leaks that are stopped.

"ENAMELS"

Our business in both White and Old Ivory Enamels and Primers has trebled during the past year.

WHY?

They are the best on the market. If you are not using them, write for samples and prices.

The money a Nichols Paint and Varnish Dryer saves will pay for the equipment in one year.

This is not a wild statement but one we have proved time and again to manufacturers in practically every branch of the woodworking industry.

The Nichols Vertical Paint and Varnish Dryer is a complete unit of fan, motor, heaters, air compressor, with automatic humidity and temperature controls. A new rotary, humidifying air washer which eliminates all dust and dirt and does away with all spray heads, pump and connecting piping.

The equipment is manufactured in sizes suitable for all requirements.

Let us analyze your particular needs and quote prices on same.

Increasing the Speed and Decreasing the Cost of Your Finishing Room Operation

How practical, how advantageous and how dependable DeVilbiss Spray-painting equipment is, has been demonstrated in finishing rooms of every size and line.

Not merely in dozens of finishing rooms, but in thousands of them. Not only where a few different kinds of articles are handled, but where every kind, size and grade of wood or metal product is finished. Not alone where varnishes, enamels or lacquers are used, but where every kind of liquid finishing material is applied. The

DeVilbiss
Spray-painting System

offers a complete, adaptable and guaranteed service. The finishing operation is speeded up 4 or 5 times over hand-brushing. A perfect, uniform coating is applied on all jobs. Working conditions are made more healthful and safer. Operating and upkeep costs are reduced to the minimum.

With your consent, we'll gladly tell you whether and how the DeVilbiss System can be of service and profit to you.

The DeVilbiss Mfg. Co.

Paint your factory walls faster and better with the DeVilbiss Spray-painting portable equipment. Let us explain.

Beauty is Durability
THREE hundred years ago, violin makers of Cremona picked the most beautifully grained spruce and maple for their work. These men never failed to choose the finest of even grained wood—for the sake of beauty?—yes, but first for the sake of durability. Experience taught them that a blemish in the grain of the material too often produced uneven vibration causing "wolf" notes which ruined the instrument.
Use Birds Eye Veneer and avoid the "jarring notes" of imperfection that not only mar the appearance but compromise the durability of otherwise beautiful furniture.

Glue Room Economy and Technology

Proportions of Glue and Water and Consistency of the Glue Important—Correct Temperatures to Use

By R. H. Bogue*

Interesting Series of Articles

This is the first of an interesting and instructive series of articles dealing with the use and application of animal glue. The author, R. H. Bogue, an Industrial Fellow of the Mellon Institute of Industrial Research, has devoted several years to intensive research work on animal glue, its properties and how it should be prepared and handled to secure the best results. It will be seen, therefore, that Mr. Bogue speaks with a certain amount of authority and knowledge. In these articles are offered ideas and suggestions which if followed should enable any glue user to improve the efficiency of the gluing operation as well as effect savings in other directions. While animal glue is used in almost every woodworking plant it is usually bought blindly and handled in a very haphazard manner.

There is in common practice in many glue rooms so much waste of material, so much loss of energy, so much ignorance of the basic principles of glue handling, that the executives of every glue-consuming plant would do well to take steps to assure themselves positively whether such practice prevails in their own domain. While the trained mechanical or electrical engineer is employed to develop modern efficiency and to scrap unsound practice in other departments of the plant, the glue-room foreman has been left, for the most part, severely alone to rule over his province with whatever of business or scientific efficiency or of indifference he may elect. Since the average glue foreman has learned his trade at the hands of older glue foremen it is not surprising that progress has not been as rapid as should have been expected in this department.

Preparation of the Batch

The only way to overcome this hereditary prejudice is by a system of deliberate constructive education of the glue workmen. Not by means of books: technical or scientific literature make little impression, but by the employment of a few comparative tests which he may see and appreciate. A few of the special precautions that should be introduced are set forth in the following paragraphs.

Many glue workmen make up their batch of glue by measuring out a number of buckets or barrels of glue and adding to that a number of buckets or barrels of water. This procedure may result in a considerable variation in the concentration of the liquid glue resulting. Glue is marketed in a number of different forms: as sheet glue, flake glue, ground glue, etc., and each of these in turn may be made in thicknesses varying from about a fiftieth to a quarter of an inch. Where the glue is made very thin, a 12 quart pail full of the flake will weigh only about 6 pounds, while in the very thick cut material the same volume will weigh up to 15 pounds. In the case of ground glues the variation may be from about 12 to 21 pounds. Obviously, if a foreman who had been using a medium thick cut glue was supplied with a thin cut material, his pail, now holding a smaller weight, would measure off for him a smaller concentration for his liquid and, if the glue was of the same grade as formerly, all of the tests resulting would of course, be low.

But even in the measuring out of glue from the same barrel the weights are apt to vary as much as two pounds in a 16 quart pail, which shows that consistent work cannot be accomplished by measuring, even under the most favorable conditions. The most favorable concentration by weight should be determined once for all for a given grade of glue and a given service, and it should then be insisted upon that all batches should be made up by weight—so many pounds of glue to so many pounds of water.

Consistency of Glue Very Important

There has been no standard of optimum consistency or body of a glue that would produce the best results yet proposed. Each house has its own conception upon this point. In the absence of more definite information, however, it is safe to say that many glue workmen use solutions of too high a viscosity. The glue is too thick oftentimes to properly penetrate the pores of the wood, and at the same time it sets too rapidly. A higher dilution, keeping the temperature at 140 degrees F., would result many times in better penetration, slower set, and in general more satisfactory results, in addition to a lowering of the cost per square foot of area covered. A soft porous wood cannot, however, stand as great a dilution as can a denser wood, on account of the rapidity with which the thinner solution would be soaked up in the former instance.

In making any test upon the spreading capacity of a glue, attention must be given, not only to the actual weight of glue in a given weight of water, rather than a volume relation, but also very carefully to the temperature of the test. The viscosity increases very rapidly with every decrease in temperature, and while a 40 per cent solution, for example, will produce a desirable viscosity at 158 degrees F., a 35 per cent solution would be sufficient at 140 degrees, and if the temperature were allowed to go to 104 degrees a 25 per cent solution would produce the

*Industrial Fellow, Mellon Institute of Industrial Research.

same consistency. The tests are best taken always at 140 degrees F.

Soaking Assists the Melting Process

Unless special precaution is taken to insure the complete covering of the glue by the water during the soaking process, some of the glue will very often extend above the water and not become softened. In the case of thin cut bulky glue this is very often the case, the water sometimes covering only a half or less of the material. Upon warming a batch of glue prepared in this way the unsoaked portion will resist the action of the warm liquid and a greatly prolonged heating, or an excessively high temperature, is necessary to bring it all into solution. And such heating has been shown to result in extensive loss due to the hydrolyzing action of the water.

To overcome this difficulty the glue may be added in portions, the first portion being swollen before the second is added, or the whole mass may be turned over, the top being placed on the bottom. In the case of ground glues the entire batch of glue should be stirred into about three quarters of the water required, and after soaking for a time the balance of the water added. This procedure prevents any of the light flakes from floating on the water and so not being properly soaked.

The temperature of the water should not be high, for above 68 degrees F., the bacteria may become active. A temperature down to near the freezing point does no harm but an actual freezing of the swollen glue is probably harmful. If flake glue, or any very thick material is used, the glue should soak for 10 or 12 hours, but if ground glue is employed, an hour or two is usually sufficient. In either case the flakes of glue should be completely swollen, and not show any hard places, as these will not be easily dissolved.

The water used should be as pure as is practicabally obtainable. Acids or alkalies in water, dissolved salts, or suspended material, each exert an effect upon the gelatin or other constituents of the glue, and undesirable results may be obtained from this source. The bacteria in contaminated water may be the cause of unusually rapid spoiling of a batch of glue.

Temperature Should Be Tested Not Guessed

Heat may be applied to the swollen glue in a number of ways. The most advantageous method, however, is to apply steam to an outer jacket in which the glue container is placed. The glue should be stirred slowly during solution, and the temperature not allowed to exceed 150 degrees F. The water in the outer jacket should not at any time exceed 158 degrees F., and after solution is complete the temperature in both sections should be adjusted to 140 degrees. A thermometer is indispensable, for without its use the temperature cannot be correctly gauged or controlled. The kettle should be covered to prevent evaporation, and the glue is best delivered into the workmen's pots by means of a cock placed near the bottom of the kettle. Only that amount of glue which will be used within two or three hours should be kept in the glue kettle. Properly soaked, glue may be brought into a condition ready for use in a few minutes, and the saving in the strength of the glue warrants this procedure.

Another method of operating that is employed in some plants is to make up the glue into the form of a concentrated jelly, and to distribute this jelly to the workmen as needed. The workmen add a given amount of water to a given weight of jelly, warm it over their bench heater, and it is then ready to apply. While this procedure reduces to a minimum the loss due to prolonged heating, it produces conditions which, unless very carefully controlled, are favorable for the rapid development of bacteria, and large batches of jelly are apt to spoil before being used up. If the jelly is kept in an ice box this danger is averted, and very satisfactory results may be secured.

What the Furniture Store Tells

A Stroll Through a Furniture Store Might Prove a Revelation to Many Furniture Manufacturers and Suggest Where Manufacturing methods are Weak—Many Faults Would be Found

By R. C. H.

It would be much more pleasant for me to tell about some of the nice things that I saw as I strolled through a large furniture store in one of our large cities, but that would not accomplish the purpose which I have in view, i.e., drawing attention of furniture workers to a few matters in connection with their work that should be corrected. Many defects that are seen in furniture after it has reached the retailer have developed after the goods left the factory. Very few concerns have so little regard for their reputation that they would knowingly send out goods in the condition in which I have seen them on display.

It is a fact that every person passing through a store does not notice defects in furniture, and may buy a defective article and have it in his home for some considerable time before noticing anything wrong—perhaps never discover the defect if somone does not point it out; but once discovered, the article at once loses much of its value to him, if it does not become a positive eyesore. These defects, no matter when or where discovered, usually, if not always, have their inception somewhere in the early stages of construction of the article.

Laid Wrong Side Out

Before us was a buffet with paneled doors, the veneer of which was mahogany stripe, cut and matched so that the strips in each piece met and formed a V. One side of the panel had the veneer laid with the right side out and the other wrong side out, to form the figure. I have sometimes thought that I am overtrained in detecting defects, because if there are any I am certain to see them first, and then all the beauty of the article is spoiled for me. I at once noticed that these panels were defective, and, feeling that way, I waited to see if my companion would discover what I had seen. Soon she pointed

Pickrel Walnut Veneers

The Accepted Quality Standard of a Superlative Article

Through its remarkable merit and beauty walnut has been honestly and cleanly sold to the public. It has stayed sold, reaching every month new fields of utilization, purely by virtue of its undisputed superiority and the uniformly high-class product offered. Pickrel Walnut Veneers are not only universally accepted as the quality standard in established lines of walnut consumption, but are greatly contributing to walnut history in the many interesting new fields which walnut is gradually dominating. Established walnut buyers know our product and service. To new users of walnut veneers we would like to not only emphasize our impressive selection of veneer logs, our honest, careful and experienced manufacture, and the 6,000,000 to 7,000,000 feet of selected reserve veneers always on hand, but to particularly stress the importance of the experienced and conscientious individual representation through which Pickrel veneers are offered at their respective plants. This genuine personal touch insures the closest possible conformity to individual requirements, meaning less cost in working and a better finished product.

What the Furniture Store Tells

(Continued from page 82)

to the defective side of the panel and asked: What makes this half of the panel look as though it were pebbled?"

The cause of the trouble was in the veneer itself, or rather the cutting of the veneer. It is difficult to cut veneer with the wrong side so perfect that it will finish and never show signs of ruptured fibers; but it can be done, and is done. One should examine the wrong side of th veneer very carefully before taking the risk of laying it with this side up. In matching veneer it is necessary at times to reverse each alternate sheet in order to produce the desired figure, but only the most perfectly cut stock can safely be used for this purpose. The checks in the panels before us were very small, and it is not likely they were ever seen by the workmen in the factory, but the varnish had checked along the line of the checks in the veneer and magnified them many times.

When stock of this kind stands for some time in the factory before rubbing, the checks will show; and then the usual practice is to revarnish and rub out before it has a chance to check the newly-applied varnish. This does not, however, correct the matter, because the varnish last applied will check as did the first. When buying veneer one should know the purpose for which it is to be used, and never buy stock that must be reversed to produce the figure unless it is absolutely free from ruptured fibers that cannot be removed in the cleaning up.

Crossbanding at Fault

The next defect that attracted my attention was a depression about the size of a dime in the centre of an otherwise beautiful table top. Although small in size, the effect could not have been much worse had the defect been many times larger, for it seemed to have more power to attract attention, it being the first thing about the top that my companion noticed. It was not a defect in the veneer itself, but in the crossbanding below, and which showed through the veneer. It is just possible the crossbanding had contained a deep bruise at the time it was laid, and the workman thought it would fill up with glue and never be seen again when covered with the face veneer. But the glue had shrunk in drying and drawn the face veneer down with it, and there was the defect, showing many times worse than the original when viewed in contrast with the beauty of the surrounding surface.

Crossbanding should be handled as carefully as face veneer in order to avoid injury to the face side. Defects in the face side of crossbanding should be remedied before the face veneer is laid. When crossbanding and face veneer are laid at different times the defects can better be remedied after the former has been laid. If it is a bruise or a hole, it should be filled up with either a plug or glue and sawdust. Do not think to remedy matters by scraping out a shallow bruise unless the whole surface is taken down to the same level. When the hole is filled, give the filling time to dry and shrink before leveling off. Never put in a plug with the end wood to the face, for such a plug will not respond to the action of the glue, nor to atmospheric changes, in harmony with the surrounding surface, and the result will be either a raise or a depression.

Crossbanding that is 1/8-in. or heavier is more liable to have an uneven face than the thin stock. This gives one more reason why heavy crossbanding should be laid in advance of the face veneer, for if both are laid at the one time there is no possibility of having a perfectly level surface when finished. In preparing the surface of such crossbanding for the face veneer care should be taken to see that the surface is taken down at all points alike. If the surface is very uneven, requiring a moderately deep cut, the triple-drum sander is the machine to use. Put fresh, coarse paper on each roll so that the cut can be made clean without much pressure. If much pressure is given the paper may cut deeper into some parts of the wood than in others, and thus defeat the very object which we have in view. If the crossbanding has a fairly even surface the wood-scraping machine is the thing to use. It may be necessary to run the stock through the scraper more than once to produce a perfectly level surface. As soon as the scraper touches at all points, the required surface has been produced. By watching the shaving one can tell whether or not all points have been touched.

What Caused Blotch in Finish

"What is the cause of the blotch in the finish on the panel of that bed?" asked my companion, indicating a bed that formed part of a beautiful mahogany suite. She had noticed the defect like a large grease spot, but was what is known in the finishing room as "sweating;" at least it is frequently called by that name, although sweating is something quite different. The trouble before us was caused by rubbing through one coat of varnish into the coat below—at least that was the immediate cause of the defect, but the primary cause went farther back. In the early days of finishing as we know it today it was the common practice, where two or more coats of varnish were applied, to allow but a short timt for the first coat to dry before applying the second coat, and about double the time for the second coat to dry before applying the third. This method was thought to hasten the final drying in preparation for the rubbing.

The fallacy of this argument has frequently been shown, nevertheless this method is still followed in a few shops, and where the method is followed there is always danger of what is frequently misnamed "sweating," as well as the cause of that very thing. Sweating is caused by a too-rapid hastening of the early stages of the finishing process, sometimes by surfacing before the filler is dry, or following with the second coat of varnish too soon after the first has been applied. But the defect before us was not caused by any of these. It was caused by the second coat of varnish being too dry before the last coat was applied. This prevented a perfect union between the two coats, and when the rubber went through the outer coat in places into the one below, the two coats showed up distinctly, giving the finish a blotchy or smeary appearance.

Drying Each Coat of Varnish

Instead of hastening the early stages of the finishing process, the proper way is to allow each coat to become quite dry before the succeeding coat is applied, until one reaches the point where a perfect union of coats becomes necessary. In the case of three-coated stuff the first coat should be allowed to become perfectly hard before the second is applied. This will take a longer time between these two coats, but the time will be fully saved between the second

and third, and more than regained in the final drying. The second coat will dry much more rapidly if the first coat is perfectly dry; and, what is more, it is not necessary to allow it to become as dry before applying the third coat as when the first coat is only partially dry. When the first coat is only partially dry at the time the second is applied, there is always danger of "crawling," unless a long time is allowed for the two under coats to harden. Then comes the trouble we are trying to explain. The surface of the second coat takes on a hard film—too hard for the solvent in the following coat to make an impression on it, and the result is an imperfect union. With the first coat perfectly hard it is no longer a factor to be reckoned with in the drying of the succeeding coats, so that the second coat may be followed with the third in the same time as though only two coats were being applied and the second coat were the first coat. By this method there is no dividing line between the last two coats, because they have united as one.

There is no danger of allowing the first coat to become too dry before applying the second, as there should never be any necessity for the rubber to go deep enough to reach the first coat. Stock that requires so much rubbing that the first coat of varnish is endangered before a smooth finish is obtained should have the attention of the head of the woodworking department called to it, and greater attention given to the cleaning up of the surface for the finish.

Handling Veneers in Storage

Serious losses occur in many plants because sufficient attention is not given to the storage of veneers. Often when roaming through a plant one finds the flitches and bundles of veneers piled here and there on the floor in the veneer storage room, being handled time after time, in some cases walked over, with the result that the loss from breakage and spoiled stock is much higher than it should be. In the well-managed plant veneers are all carefully sorted and stored on suitable racks, different woods and different flitches being kept by themselves, each lot being tagged or identified in some other way.

Storing the veneers in racks offers certain advantages. Not only is it possible to accommodate more material in a given space, but it is stored to better advantage as the air has an opportunity to work around the different lots and keep them in fairly good condition. Where the stock is simply thrown on the floor, if the room happens to be damp, there is a danger of mould or mildew forming or the stock being badly stained.

Veneers of different kinds cost good money, and every effort should be made to see that they are handled and stored under conditions which will not only tend to reduce all losses but which will keep the stock in such condition that it can be worked to the best advantage. The writer has been in plants where conditions in the veneer storage room were not only an eyesore but a disgrace, and in other plants where the neat, orderly way in which the stock was kept, showed a full realization of the value of well-kept veneers.

This photograph was taken of our exhibit at the Indianapolis Industrial Exposition held in Indianapolis last fall, which was attended by more than 150,000 people. Our exhibit was pronounced the finest display of Hardwoods and Veneers at the exposition.

WE HAVE THE FOLLOWING VENEERS READY FOR IMMEDIATE SHIPMENT:

1-20" Qt. Sawed White Oak
1-16" Qt. Sawed White Oak
1-8" Plain Sawed Red Oak
1-8" Cherry
1-8" Walnut
1-28" Walnut Sliced

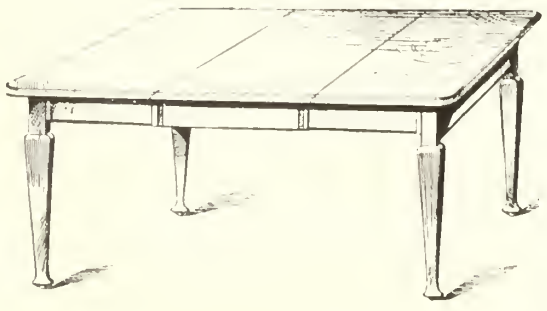
PROMPT delivery in any quantity at very attractive prices. Just let us know your requirements and we shall be glad to forward quotations.

Panels are made in Walnut, Quarter Oak, Birch, etc. Large sizes (72x24; 60x30; 60x24; 56x25; 60x20; 60x18; 48x18) carried in stock at all times.



HAY & CO., Limited Woodstock, Ont.

The Lumber Market

Domestic Woods

The Canadian market is showing signs of increasing activity in certain lines, while others are fairly quiet. Almost any kind of lumber required for building is in strong demand to-day. This applies particularly to such items as hemlock, the lower grades of pine and other material used in framing a building and also to the hardwoods used for flooring and interior trim. The residential building field continues to forge ahead of the figures set during the last few years. The total value of contracts let for residential buildings during the first four months of 1922 is $24,815.00., as compared with $18,000.000. for the same period last year. $16 000,000. for 1920 and $7,000,000. for 1919. The total volume of contracts awarded, during the first four months of 1922 covering all classes of building, reaches the tidy sum of $62,000,000. This unusnal, but gratifying, expansion and development in the building field is bound to be reflected in the lumber arena and, in fact, will, through time, have a stimulating effect on the furniture and allied industries. The general demand for hardwoods, that is, hardwoods as a whole, is none too brisk, while those catering to the building industry are using a fair volume of hardwoods of different kinds. yet some of the most important hardwood-using industries, such as the furniture industry, are facing a quiet period, and as a result are not in the market. In this field all indications point to a stiffening of values, stocks of Canadian hardwoods in Ontario are becoming badly broken and present prices are considered to be ruinous. One wholesaler recently stated that the producing mills are demanding more for their hardwoods than he is able to get on the open market. The demand for thick birch is not quite so insistent, but there is a steady call for 4/4 stock in 1sts and 2nds, and also for No. 1 common. This latter item is reported to be getting scarce with a tendency toward higher prices. In maple, 6/4, No. 1 common and better seems to be the favorite item. Basswood is fairly quiet with elm showing signs of increasing activity. It would seem as if those who have hardwood stocks for sale, are holding them for firmer prices. Practically all the sawmills in Ontario have started up for the season and the cut is likely to at least equal that of last year.

Imported Woods

Demand for hardwoods is steadily increasing while stocks are becoming more depleted. The tone of the market is strong, and growing stronger daily. New price lists are being circulated by many of the southern producers, carrying substantial advances on numerous items. It is reported that, due to order files being far out of proportion to the available supplies and to the still unfavorable production conditions, some firms are withdrawing their salesmen from the road, and have withdrawn practically all their offerings. Consuming interests in the meanwhile are showing genuine anxiety regarding their future supplies. Industrial activity, as a whole, is expanding and stocks in consumers' hands are in most cases, far from ample to sustain increased operations, and the search for the required hardwoods is in many cases becoming really frantic. The manufacturers of flooring, interior trim and sash and doors, who continue to find their business expanding with the steady development of building construction throughout the country, have particularly large needs to satisfy and are scouring the market for everything suitable to their purpose. Next to the building material interests, the automobile and body manufacturers are probably the most active on the market at this time. They are buying sizable quantities of thick elm, ash and miscellaneous hardwoods, and it appears that their future needs will be large. The furniture trade has shown no great change, altho the tendency seems to be toward a larger volume. Sales of low grade cottonwood, gum and oak are increasing, according to most reports, and prices seem to be substantially above the average of about a month ago. Reports from the northern producing sections state that the market is showing increasing strength and stability, in that manufacturers look for further price advances on a number of items shortly, because of the serious shortage existing in them. These sections also report that the demand for low grades shows improvement, and that several large sales of No. 3 common have been made at prices higher than those previously obtained.

Memphis, Tenn. Our reports from Memphis indicate that there has been an increase in the demand for hardwoods of various kinds, and as a result, the tone of the market is considerably firmer. New quotations now being sent out, show a number of increases over the lists issued during the past few weeks. Production is still low with short stocks, and as a result, some of the lumber manufacturers have recalled their salesmen. It would appear as if consuming interests are showing a greater insight with regard to their future supplies. This applies more particularly to sash and door men and manufacturers of flooring and interior trim. There has not been much change in the attitude of the furniture industry which seems to be resting easy. In this particular field the greatest activity is being shown in gum, oak and cypress.

Louisville, Ky. The increased building activity has had the effect of increasing the activity in this market. Prices have advanced on certain stocks, more particularly red gum and poplar in the heavier sizes. Pine has advanced on this market $4.00 to $5.00 per M. and the prospects are that hardwoods will follow suit. One reason why this is likely to occur is because of the decreased production due to high water in the southern districts.

Evansville, Ind. There has been a slight improvement on the Evansville market. Part of this is due to an increasd demand from furniture factories for veneered stock. Apparently the high water in Western Kentucky is showing signs of subsiding, which means that logging operations in this district may be resumed shortly. This will have the result of increasing the production of the Evansville mills. As Evansville is a furniture-manufacturing centre of no mean importance, it is interesting to note that there is less employment than a month ago, and some of the furniture factories state they are employing 98% of their normal forces.

The planing mill of John H. Crandall, Moncton, N. B. was recently destroyed by fire entailing a loss of between $4,000 and $5,000.

Suggestions of Live Current Items

The usual famous Anderson-Tully service stands behind every foot of the following list of specials which we are pleased to offer the buying trade:

QUARTERED WHITE OAK

4/4 FAS 150,000

Full product of the log in this grade. Stock containing all of the 10" and wider produced, average 7½" for width, 45% to 55% 14' and 16' lengths.

4/4 No. 1 Com. & Selects .....150,000'

Full product of the log in this grade. 45% to 55% 14' and 16' lengths. Stock 8 to 12 months dry.

QUARTERED SYCAMORE

6/4 No. 1 Com. & Bet ..... 75,000'
5/4 No. 1 Com. & Bet. ..... 40,000'

Sycamore is beautifully figured stock, band sawn and equalized, 7 to 8 months dry. 55% to 60% 14' and 16' lengths. All wide in this stock.

LOCUST

4/4 Log Run .....One Car

SOUTHERN SOFT MAPLE

5/4 Log Run .....100,000'
(Worm holes no defects)
10/4 Log Run .....100.000'
(Worm holes no defects)

PLAIN RED OAK

5/4 Common & Select .....60,000'

PLAIN SAP GUM

5/8 FAS .....150,000'

PLAIN SYCAMORE

5/8 No. 2 Com. & Bet.....100,000'
6/4 No. 1 Com. & Bet. ..... 100,000'

Both items running 60% long lengths. Band sawn and equalized and 7 to 8 months dry.

HACKBERRY

5/4 No. 1 Com. & Bet. ..... 150,000'

Band sawn, thoroughly dry, and high grade in every particular.

HICKORY

8/4 No. 2 Com. & Bet. ..... 200,000'
6/4 No. 2 Com. & Bet. ..... 100,000'
10/4 No. 2 Com. & Bet. ..... 20,000'
12/4 No. 2 Com. & Bet. ..... 30,000'

WILLOW

We make a specialty of Willow in 4/4 to 8/4 thickness, and have a stock of this wood. We particularly want to move

4/4 No. 1 Common ..... 200,000'
5/4 FAS. ..... 40,000'
6/4 No. 1 Com. & Bet. ..... 100,000'
8/4 No. 1 Com. & Bet. ..... 50,000'

All of this stock thoroughly dry.

Discriminating buyers will find that it pays to be linked with an organization and service so truly founded on an understanding not only of the manufacture of lumber, but of its proper merchandizing and utilization.

ALL STOCK SIX MONTHS AND BETTER DRY

ANDERSON-TULLY COMPANY

MEMPHIS, TENNESSEE

ATCo (MEMPHIS) SOUTHERN HARDWOOD LUMBER & VENEER

Issue Dicennial Record

The Forest Products Laboratory, Madison, Wisconsin, recently published an attractive volume under the title "The Forest Products Laboratory—a Decennial Record." in commemoration of the Decennial Celebration held at Madison last year. This work covers the various phases of activity as carried on by the Laboratory and shows what has been accomplished in the way of more efficient utilization of forest products and in the elimination of waste. It traces the growth and development of this important institution and outlines how its activities have been enlarged to embrace practically all phases of the wood-manufacturing and wood-using industries. The war work of this institution is covered in detail. It will be remembered that the Forest Products Laboratories rendered signal service in the development of plywood, plywood glues, aeroplane propellers and kiln-drying methods for the use of manufacturers of aeroplanes and aeronautical supplies. Anyone desiring a copy of this interesting and instructive book can secure one from the Forest Products Laboratory upon payment of $1.75.

Bonus System That is Different

A bonus system which ultimately will affect all its factory employes has been inaugurated by a manufacturing concern in Cleveland, Ohio. The bonus is in addition to and entirely independent of hourly wages, and differs materially from the ordinary piece work.

Only good pieces of work that pass rigid inspection qualify the workers to earn a bonus. All jobs will be analyzed and classified according to the skill required of the operator, every job being assigned to one of ten bonus qualifications.

In addition to a job bonus classification a standard table of fatigue and rest allowances, classified according to the job, is adopted—from 10 per cent to 22 per cent allowances are made for fatigue and rest, the most being applied to work which puts the greatest strain on the worker.

When a job has been studied and classified, a bonus chart and instruction card is filled out and given to the worker. The instruction card shows the method by which the work should be done, giving equipment, set up, total time for each part of the operation, total net time, time allowance for fatigue and the standard time for doing the job.

The chart is set on the standard time of the instruction cards for 100 per cent efficiency, but a man begins to earn the bonus when he reaches 60 per cent. of the standard. The bonus chart shows the amount of money which may be earned by increasing the output.

It is an attempt to pay the workers according to their ability.

Two More Glue Suits Decided

In the suits brought against the Wisconsin Chair Co., and the Gould Manufacturing Co., by the Perkins Glue Co., the judge upheld the decree of the Court of Appeals and dismissed both cases. In both these suits the adhesive used was Kane vegetable glue.

VENEERS
and PLYWOOD

THE KRAETZER-CURED LUMBER CO.

Your Protection—Our Guarantee

Kraetzer Curing—What It Is

Kraetzer Curing is simply the modern and more efficient application of the treatment of wood relied upon by the artisans of the earlier periods in the construction of their master pieces of cabinet work. Even, now, after the elapse of centuries, we still frequently encounter such pieces in a perfect state of perservation.

This treatment is even more beneficial to Gumwood than to the woods employed in those earlier times. Kraetzer Curing immediately eliminates the sap and gelatinous substance in the wood. It also completely does away with fermentation and the resulting strain and decomposition, which by some is considered a necessary and deterring evil.

Likewise, Kraetzer Curing makes the sap portion of the wood more dependable than the Heart or Red Wood. It can then be used for practically all purposes with equal or greater satisfaction than Red (or Heart) Gum, Birch, Maple or other woods. It is available at materially lower prices.

Send for the Kraetzer-Cured Booklet, and write or wire for quotations.

The Kraetzer-Cured Lumber Co

name from Jewett Phonograph Co., of Canada, Ltd., to the above. Their capital has been increased from $950,000 to $1,000,000.

The Columbia Gramophone Co., Toronto, are contemplating operating their large phonograph factory on Dufferin St. on a fairly comprehensive scale. When these plans are completed, employment will be given to a large number of hands.

The Starr Phonograph Co. of Canada, Limited, London, Ont., recently suffered a loss by fire when the building in which their assembling plant was located was badly damaged. The loss to the Starr Company is in the neighborhood of $15,000.

The Hespeler Furniture Co., Limited, Hespeler, Ont., are adding two more Sidman units to their battery of dry kilns. This is their third order for Sidman kilns and like their last addition the buildings will be of the Sidman concrete type.

Frames & Fancies, Limited, Montreal, have been incorporated to manufacture and deal in picture frames, mouldings, toys and other wooden articles. Capital $20,000. B. H. Clark and J. Wareing, both of Montreal are two of the incorporators.

Hespeler Novelty Mfg. Co., Hespeler, Ont., are negotiating for a plant at Tara, Ont. If these negotiations are successful, equipment will be installed for manufacturing sleighs, hockey sticks, coaster wagons and wood novelties of various kinds.

C. Lloyd & Sons, Wingham, Ont., have been granted a provincial charter with capital of $80,000 to manufacture and deal in sash and dooors and wood products of all kinds. A. E. Lloyd and R. H. Lloyd, both of Wingham are two of the incorporators.

The new box factory erected for D. R. McKay at Laidlaw, B. C., near the site of the old mill, burned last fall, commenced operations this week. It has a capacity of 5,000 boxes per day and is equipped with modern veneering and wiring machinery.

The Canadian Vickers, Limited, Montreal, shipbuilders, have taken over the Canadian agency to manufacture sea sleds under license from the Sea Sled Company. The latter company is purely Canadian and holds the basic patents rights for Canada and United States.

A Henderson, of Cheltenham, Ont., contemplates establishing a new planing mill and woodworking factory at Orangeville, Ont. Mr. Henderson had a planing mill at Cheltenham but it was destroyed by fire some few weeks ago and he has decided to try a new location.

The planing mill and furniture factory of McCall & Co., St. Williams, Ont., was recently destroyed by fire entailing a loss of $75,000 with a small portion covered by insurance. The dry kiln, two large lumber sheds and a quantity of pine and hardwoods was also consumed by the flames.

W. R. Hughes Company of Canada, Limited, Toronto, have been granted a federal charter to manufacture and market paints, oils, enamels, lacquers and other chemical preparations. Capital $50,000. E. G. Long and R. O. Daly, solicitors, both of Toronto, are two of the incorporators.

A suggestion has been made to the sity council at Brandon, Man., by magistrate A. C. Fraser, that the city purchase a house moving equipment and move 150 residences, at present situated in low lying districts subject to flood conditions, to higher sites in the city which are available.

Hillingsworth & Whitney, Limited, Halifax, N. S. have been granted a federal charter to manufacture and market barrels, tubs, boxes, veneers and all kinds of cooperage stock. Capital $4,000,000. Two of the incorporators are S. D. Jenks and W. C. MacDonald, solicitors, both of Halifax.

The interior woodwork of the new Royal Bank, Walkerville, Ont., which was recently opened to the public was installed by the Canadian Office and Schools Furniture Co., Preston, Ont. According to a statement made by one of the company officials they have the contract for interior fittings covering all Royal Banks in Ontario.

The Millwork Cost Bureau formerly located at 11 South La Salle St., Chicago, has removed its headquarters to more commodious and convenient offices at 605 North Michigan Avenue. The expanded service and increased membership of the bureau made it necessary to obtain more office space according to the advice of secretary W. P. Flint.

The White Sewing Machine Co., Limited, Guelph, Ont., have completed plans to engage in the manufacture of school furniture. This will be in addition to their line of sewing machines. It is expected that the staff will be increased from 60 to 200 men within the next month or two and that by the end of the year they will be employing 500 hands.

The Forests Products Engineering Co., Manhattan Bldg., Chicago are installing their basic time standards, earned hours wage incentive plan and improved methods of operation, in the plant of the Knechtel Furniture Co, Limited, Hanover, Ont. The McLagan Furniture Co., Limited and the Stratford Chair Co., Limited both of Stratford, Ont., are using these methods with gratifying results.

The hockey team of James Davidson's Sons, Ottawa, Ont., won the championship of the Manufacturers' League during the season just closed. This team made a very enviable record, losing only two out of the thirty games played. This success was in no small measure due to the hearty cooperation and assistance rendered by Messrs. Grant and Keith Davidson, sons of the founder of this well-known organization.

Alexander Brown, Winnipeg, of the firm of Alexander & Brown recently passed away in his 81st year. Deceased was a former citizen of Galt, Ont. and as a young man went West in 1872 with Thomas Rutherford and founded the first planing mill and sash and door plant in Manitoba. The firm which still bears the names of the pioneers will be carried on by the sons of the two original founders.

The United States authorities are taking action under the dumping clause of the Emergency Tariff Act to prevent Canadian manufacturers of veneered chair seats shipping into U. S. markets at a price which cannot be met by American chair seat manufacturers. Under this act the duty will cover the difference between the price of the Canadian article and that produced by U. S. manufacturers where the price of the former is lower than the prices prevailing in the states.

J. J. Neander has secured suitable display space at 364 St. Catherine St., East, Montreal, and is showing a representative line of the products of the following firms:— Snyder's Limited, Waterloo, Ont., Canadian Rattan Chair Co., Victoriaville, P. Q., Sidway Merchantile Co., Toronto, and the Middlesex Furniture Co., Strathroy, Ont. This will enable these firms to handle Montreal and eastern trade to good advantage. The displays are being made on two floors of a modern fireproof building, giving about 10,000 square feet of floor space. Mr. Neander is well known to Montreal and eastern firms and his experience and connection should go far to making this new venture an unqualified success.

Building in United States

For the first time since 1916, enough new dwellings will be built in the U. S. during the current year to more than care for the increase in demand, according to reports received from over the country by the civic development department of the Chamber of Commerce of the United States. In other words, the prospects are, according to these reports, that the accumulated shortage of dwellings will be somewhat cut down this year.

San Antonio Plans Auditorium

Plans are being drawn for a municipal auditorium by San Antonio, Tex., to be erected in Madison Square. These plans will call for a steel and concrete structure with a seating capacity of about 6,000; the sum of $500,000 is available for the purpose. The planning is being done by Ralph H. Cameron, architect, under the general supervision of the city engineer, D. D. Harrigan, who will also have charge of construction. It is anticipated that the work will start about July.

Big Highway Program Under Way in Texas

Texas has over 2,000 miles on state highways under construction according to the reports received by the U. S. Bureau of Public Roads. This includes 146 miles of concrete and brick pavements, 425 miles of bituminous pavements, 1,190 miles of gravel and macadam roads and the remainder sand-clay, shell and earth roads. This large program is estimated to cost about $28,700,000 of which amount $13,300,000 is to be paid by the state and federal governments, leaving about $15,400,000 to be paid by the counties and road districts.

New work to be undertaken this year will amount to about 1,350 miles estimated to cost $17,265,000. This work will be financed 25 per cent by the state and 25 per cent by the federal government, and 50 per cent by counties and road districts. All federal-aid funds apportioned to Texas have been definitely allotted to projects, according to J. D. Faultleroy, state highway engineer.

Last year 1,078.5 miles of state roads were completed at a cost of $10,637,821.47 but this year's work is expected to exceed these amounts by at least 50 per cent.

Thetford Mines, Que.

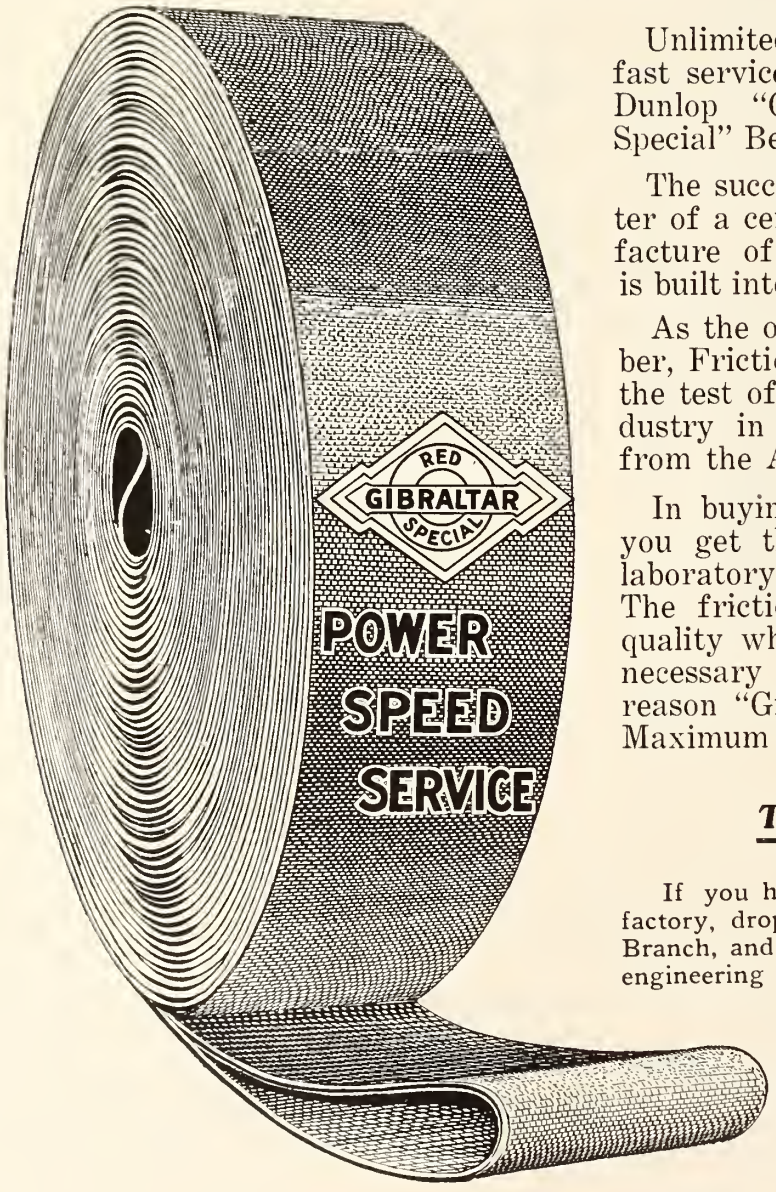
Dunlop Belting

—FOR—

Maximum Power, Speed and Service in the Woodworking Plant



Unlimited capacity for hard fast service is the feature of Dunlop "Gibraltar Red-Special" Belting.

The success of over a quarter of a century in the manufacture of Rubber Products is built into Gibraltar.

As the original Made-In-Canada Red Rubber, Frictioned Surface Belting, it has stood the test of time in turning the wheels of industry in a multitude of belt-using plants from the Atlantic to the Pacific.

In buying "Gibraltar RedSpecial" Belting you get the advantage of years of careful laboratory work on our part with this result: The friction is of that "just-right" elastic quality which allows for the give and take necessary in rounding the pulleys; hence the reason "Gibraltar RedSpecial" is known for Maximum Power, Speed and Service.

The Dunlop Guarantee

If you have a difficult drive anywhere in your factory, drop a line to our Head Office, or nearest Branch, and we will send a man experienced in belt engineering to consider your requirements. If it is an instance where "Gibraltar" Belting may be suitably employed we will recommend its use; and we will stand behind our recommendation with the fullest guarantee ever issued by a firm producing rubber products.

Atlas Mfg. Co. of Orlando
Orlando, Fla., U. S. A.

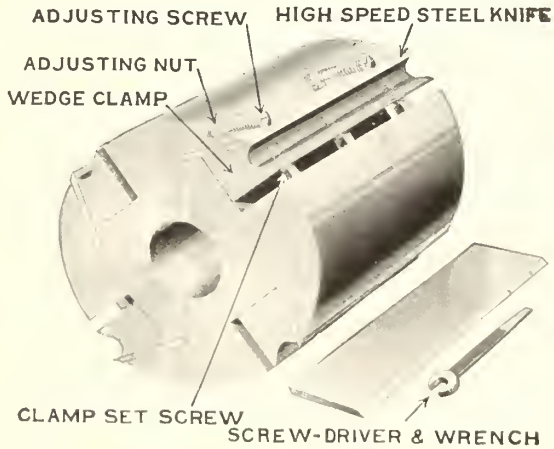
CLAMP NAILS DO IT

The Radio and Phonograph Cabinet Maker

Internationally known and universally adopted by the leading manufacturers of Radio and Phonograph Cabinets, as the most practical and economical method of mitered joinery.

Samples and circulars on request.

CLAMP NAIL COMPANY
4532 Palmer St. CHICAGO, U.S.A.



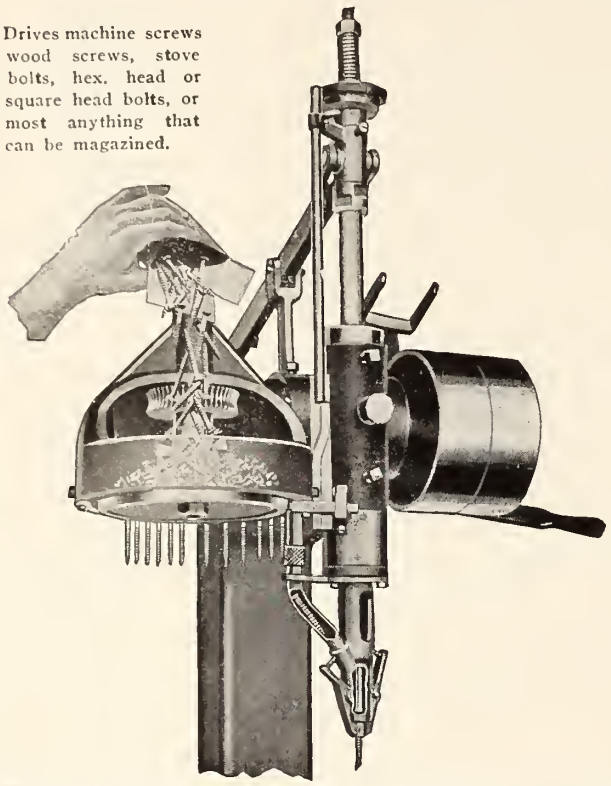
The PORTER "C" Slip-on-Head for Shapers, Jointers and Moulders will cut straight or cross grain without tearing. Irregular shaped knives can be used as well.

There are over 3,000 of these Heads in daily use.
Write for circular and quotation.

C. O. Porter Machinery Co.
GRAND RAPIDS, MICHIGAN, U.S.A.

The Demand is for Lower Prices!

Drives machine screws wood screws, stove bolts, hex. head or square head bolts, or most anything that can be magazined.



Reynolds Automatic Screw Driving Machinery will help you meet the demand

Everywhere the manufacturer is faced with the problem of price reduction. How can he find the solution?

By cutting out every waste—of time, labor materials, etc.

Many manufacturers have installed Reynolds Screw Driving Machinery for this reason. It accomplishes the work-better in one-third of the time.

Consequently they are able to meet the demand for lower prices and hasten the return to normal buying.

Are you interested? Then write us to-day for the full facts.

Send us dimensions over all of your work and gauge and length of screws driven so that we can determine the proper size and type machine to meet your requirements.

The Reynolds Machine Co.

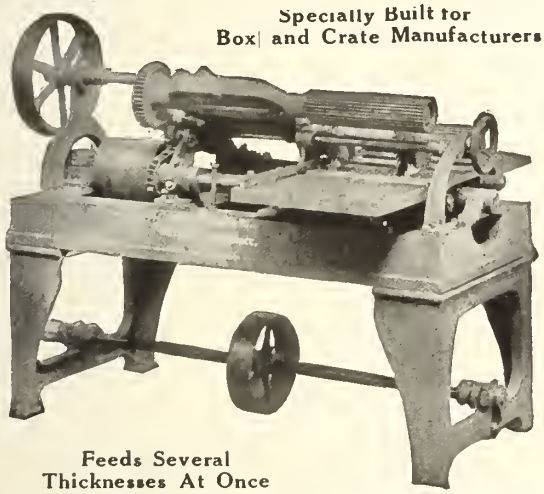
"The Chattanooga" — Just Another Name For Fast, Economical Gang Ripsawing

Specially Built for Box and Crate Manufacturers



Feeds Several Thicknesses At Once

This latest improved gang ripsaw is powerful, fast, safe and eliminates wastage. For gang sawing boards into strips or head sticks and for ripping veneers it is unsurpassed.

Has powerful feed and securely holds down and feeds short pieces. The feed rolls are automatically adjustable to varying thicknesses. Upper rolls are driven by cut gears, and the lower ones by sprocket chain. Several thicknesses of veneering can be fed thru machine at one time.

The CHATTANOOGA is an unusually big producer, easily operated, and turns to profitable account short stuff lying around a mill—otherwise wasted.

Attractive price. Complete information on request

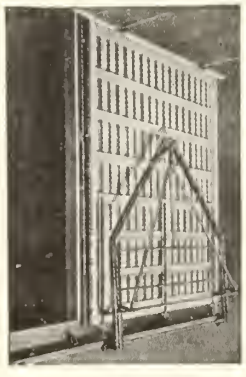
BLACK BROS.
CLAMPS

Where Black Bros. Clamps are known, there is no second choice. Know them.

Sold by Aikenhead Hardware Ltd., Toronto Vokes Hardware Co., Ltd Toronto J. L. Neilson & Co., Winnipeg and other leading dealers throughout Canada.

The Black Bros. Co. - Mendota, Ill., U.S.A

The Door Carrier System



Makes your dry-kiln doors steam-tight and saves time, heat, trouble and money.

Carrier lifts door clear of kiln and carries it down track. Returning, deposits door to rabbeted joint, where it is held steam-tight by its own weight. Applicable to old or new kilns.

Ask for catalogue.

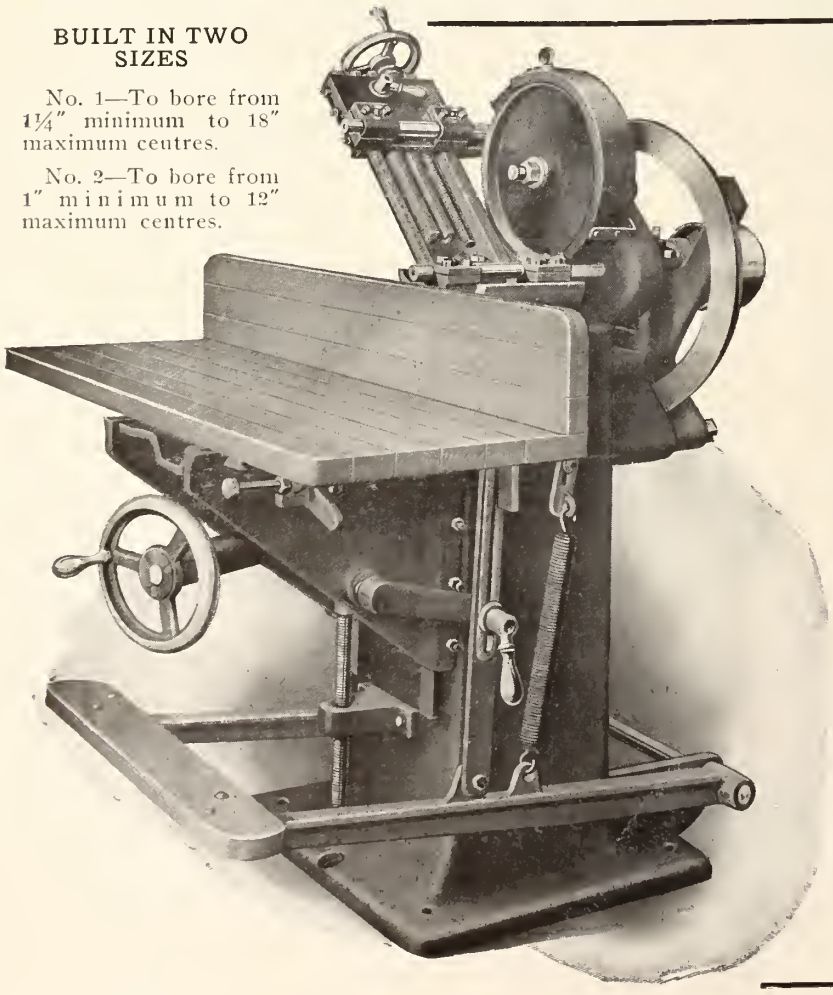
BUILT IN TWO SIZES

No. 1—To bore from 1¼" minimum to 18" maximum centres.

No. 2—To bore from 1" minimum to 12" maximum centres.



VALLEY CITY MACHINE WORKS GRAND RAPIDS MICH. U.S.A.

DOUBLE SPINDLE RADIAL BORING MACHINES

This machine is the standard of the furniture manufacturing world. It is finished with accuracy and combines versatility with never failing reliability.

The table is actuated with a central connecting rod, preventing the bureau drawer effect. The large intermediate gear is supported at any position by the large segment on the rear of the column. This rigid support eliminates the vibration set up by the action of the teeth and materially prolongs the life of the spindles.

A new **Close Center Attachment** has recently been perfected. It is universal and will bore two 5/16" holes anywhere in a circle of 1¼" with minimum centers of ½".

The new **Quick Action Clamp** attaches to the fence and eliminates the old stick.

Remember we can bore all of your holes at one time if you so desire

VALLEY CITY MACHINE WORKS
Campau Ave. and Fulton St., N. W.

LOOK IN THE SCRAP BOX

THERE is much to be learned by looking in the scrap box in any sanding room.

If it is filled with half worn paper or cloth that has dulled too quickly—if it is loaded with scrapped, partly-used belts or paper that has split and peeled long before doing full duty on the machines—then your scrap box is telling you a story of excessive waste—a story of soaring sanding costs.

Carborundum Brand Garnet Paper and Cloth Products because of the unquestioned strength and flexibility of backing—because they are uniformly coated with clean, hard, sharp, North River Garnet—because they hold their grain and produce more work reduce such waste to a minimum.

National Hand Fired Stokers

For the plant—medium size or small—that wants to cut down its boiler room staff—to get better stoking with ordinary common labor—to obtain overall efficiency of furnace and boiler of at least 70% with a big variety of fuels—the National Hand Operated Stoker is the best investment that can be made. Clean, steady fires with even refuse for fuel, common labor as firemen, is its welcome contribution to the reduction of your overhead expense.

Made by us in Canada. Let us send you illustrated descriptive booklet.

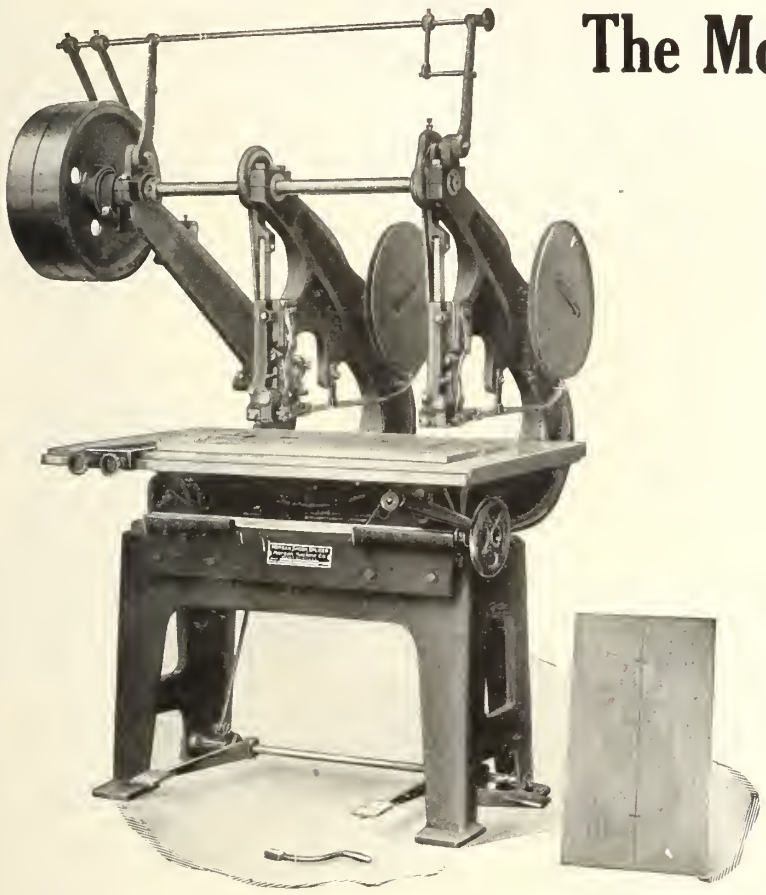
St. Catharines, Ont.

Eastern Sales Offices:
Hall Machinery Co., Sherbrooke Que., and Birk's Bldg., Montreal

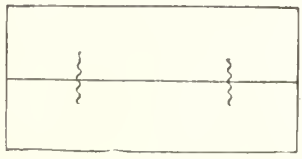


The Morgan Shook Splicer

uses narrow stock

It automatically feeds, cuts and drives corrugated fasteners. Adjustable—handles fasteners from 1/4″ to 7/8″ in width and from 3/4″ to 1 1/4″ in length.

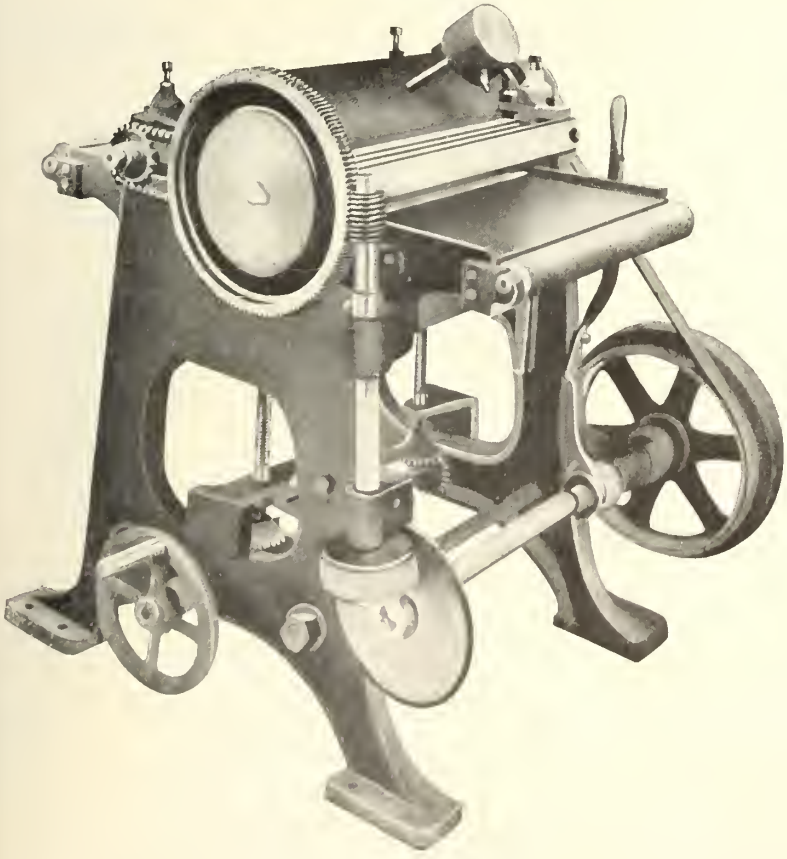
Speed, Accuracy, Economy



We manufacture Matchers, Printers and Nailing Machines.

WE INVITE YOUR INQUIRY

Morgan Machine Co.
Rochester, N. Y.



The Elliot Bull Dog Planer

6″ x 16″

The facts that the head is run by a worm gear; no pinions on the head and that the feed rolls are driven independent of the head excludes vibration. Hence—it planes smoother than any other Pony Planer made. Also it uses less power.

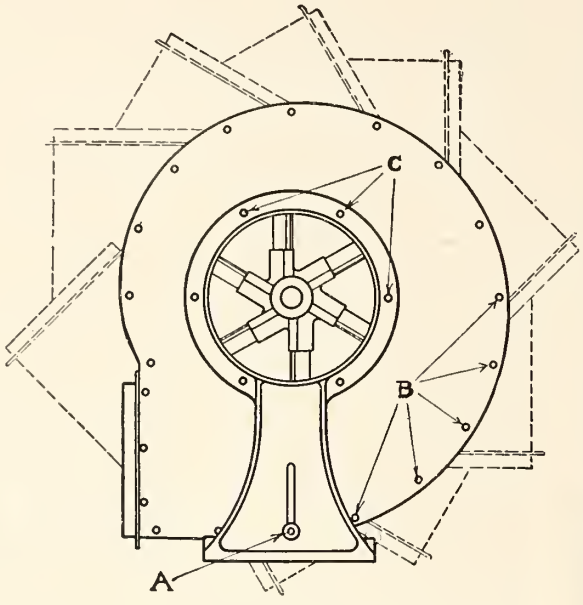
Canadian Mill Exhausters



One of the features of the Canadian Planing Mill Exhauster is the reversible housing. It is easily adjustable to either hand and to any discharge.

By this arrangement one fan may be used to meet all requirements, thus eliminating crossed belts and sharp angles.

Let our engineering department help you plan your refuse exhauster system.

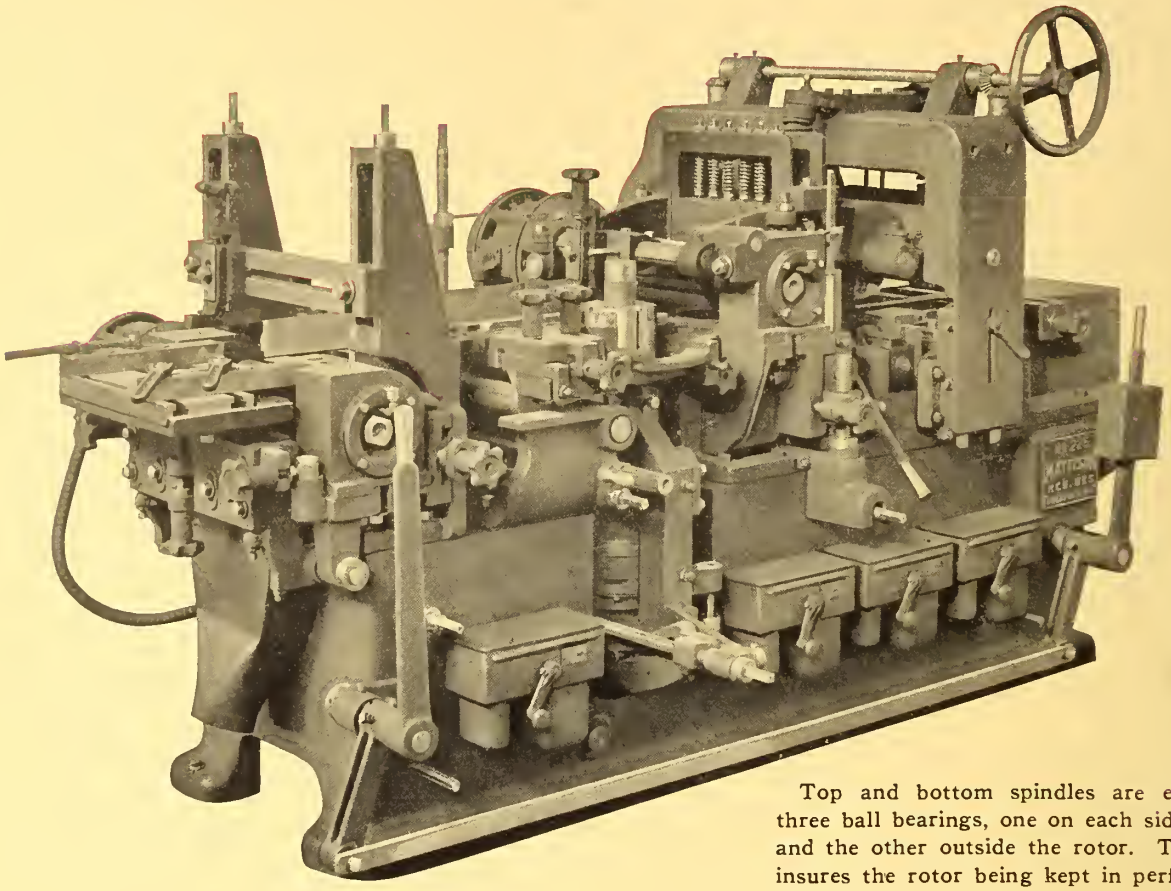
Production Demands the Electric Moulder

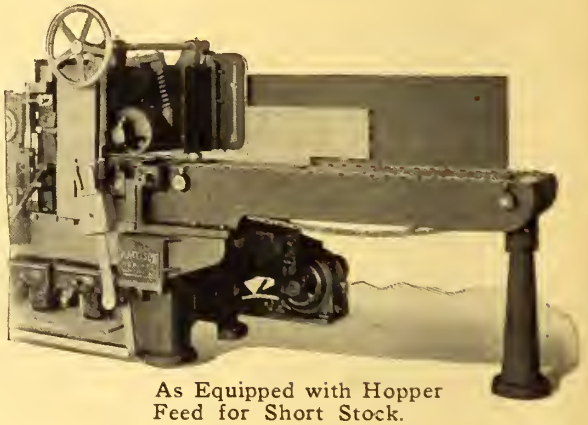


Top and bottom spindles are each provided with three ball bearings, one on each side of the cutterhead and the other outside the rotor. This outside bearing insures the rotor being kept in perfect alignment with inside walls of field coils.

TEN years ago, when a man bought the latest and most efficient type of moulder, it was a belt-driven machine. Yet, it was the best he could get.

But today, even if he selects the most efficient and up-to-date type of belt-driven moulder, he is still getting a machine that is already out-of-date. For the advent of the Motor-Driven Moulder marks the opening of a new era in moulder construction; and from now on the motor-driven type will, without a doubt, gradually replace the belt-driven moulder in all modern plants.

The Mattison Electric Moulder, with its powerful, individually controlled motors for each head and the feed works; with its removable outside bearing, and accessibility for quick set-ups, marks a wonderful advancement in moulder construction.



As Equipped with Hopper Feed for Short Stock.

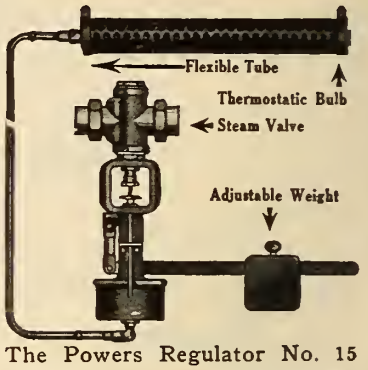
Everything in Woodworking and Metal Working Machinery

Man's Hand Less Accurate Than Machinery

A man's eye watching the thermometer. A man's hand turning the valves. He does his absolute best but you know his results cannot be uniformly right and perhaps the glue pot got too cold or the drying room too hot.

Automatic Heat Control Stops Waste



The Powers Regulator No. 15
Specially designed to control temperature in dry kilns, ovens, varnish and dry room. Entirely automatic.

Eliminate the human element—guesswork—by applying the Powers Automatic Heat Regulators. They are scientifically constructed; made to operate according to certain known physical laws. Manufactured in a great variety of types suited to practically any heat regulation condition.

Your own problem can be solved. It is worth your while to investigate.

The Canadian POWERS REGULATOR CO Ltd
Specialists in Automatic Heat Control
82 CHESTNUT ST., TORONTO, ONT.

In our thirty years of experience and study we have effected substantial economies for many users. We can do the same for you.

(1774)

DUNLOP BELTS

Respond with Economy and Long Life to all Woodworking Uses

They are built with an eye to long Service.

They save machinery by their ability to run smoothly and easily, yet they transmit the required power.

The special frictioned-surface of "Gibraltar RedSpecial," and the great flexibility of this Belt, ensure close pulley contact. It masters straining drives and off-and-on-loads.

Heat and cold, wet and dryness, do not affect it.

The Dunlop process eliminates stretch. This saves constant adjustments and undue waste of time.

For belt Economy and Belt Efficiency use "Gibraltar RedSpecial" frictioned-surface. This Belt will adapt itself to any drive.

DESIGNED for SERVICE

No. 605 Self Feed Rip Saw

The man who uses a machine is the man who knows best what features are of the most value. He knows how it should be built—where strength is required and what adjustments are handiest and most reliable.

Too often in the past, machines have been designed by men with little practical or operating experience—one designer following more or less blindly, for better or for worse, the ideas and outlines laid down by those before him.

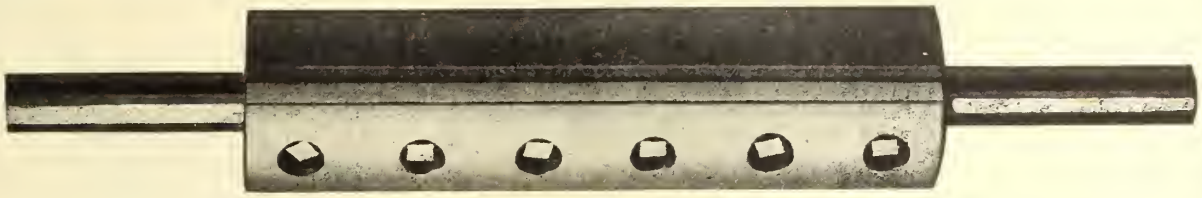
In developing our new No. 605 Self Feed Rip Saw, there was no copy-cating; Every feature and facility was carefully considered from the standpoint of service. We put ourselves in the operator's place and consulted many of the brightest and most experienced saw men in the country, with the result that we believe we have at last put before the woodworking trade a machine that is unique, in that it is strong and sure, that it is handy, that it is safe to operate, and that it will outwear with less upkeep any similar machine on the market. Thorough examination of this Saw and detail comparison with other makes only brings out its good points. The more you see of it the better you will like it.

Better have a CMC man call and tell you of its many good points of superiority or ask for special bulletin which we will gladly send you.

CANADA MACHINERY CORPORATION, GALT, ONTARIO
LIMITED

Toronto Sales Office - - 721 Bank of Hamilton Building

The Shimer Round Safety Cylinderwith High Speed Knives



A Round Safety Cylinder that will Appeal to the Buyer and the User for three Reasons:

The first is our adjusting nut for setting the knives. It is the only cylinder with properly located adjusting nuts for setting the knives, which, with our way, can be set to 1-1000 of an inch.

The second is our way of holding the knife without tapping into the head.

The third is the correct angle of cut for the knives.

Made for Any of the Different Makers' Machines and in Any Length Cylinder.

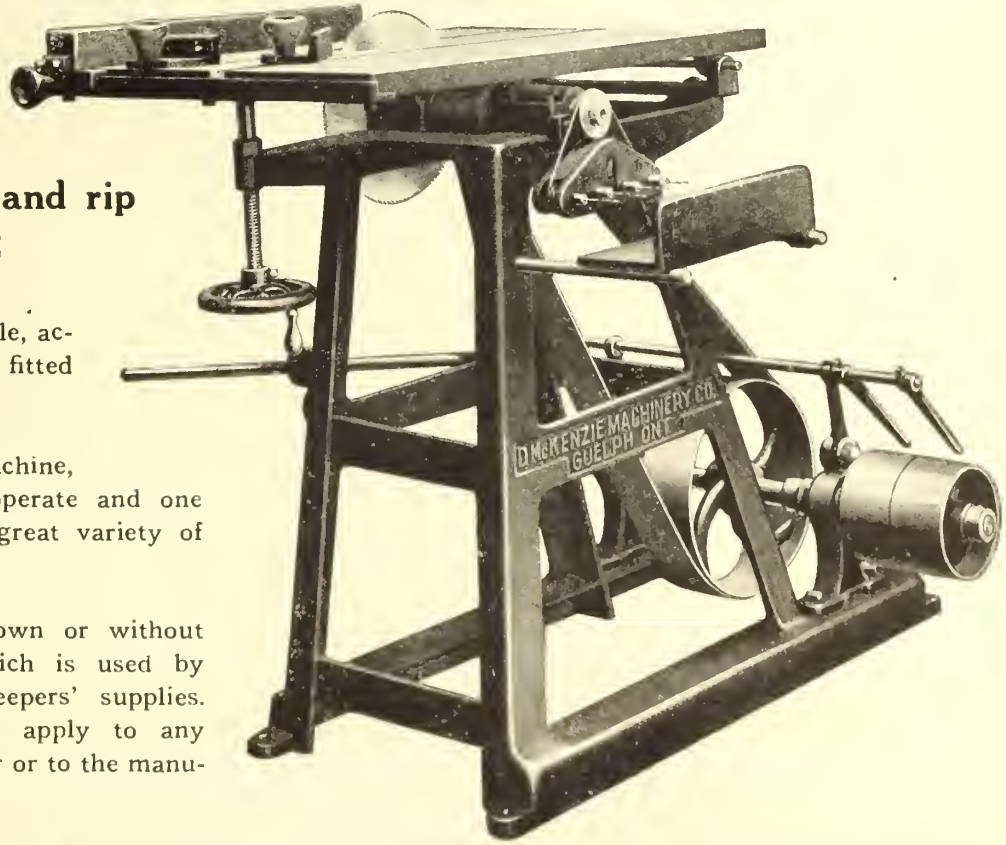
McKenzie



Cross-cut, mitre and rip Saw No. 2

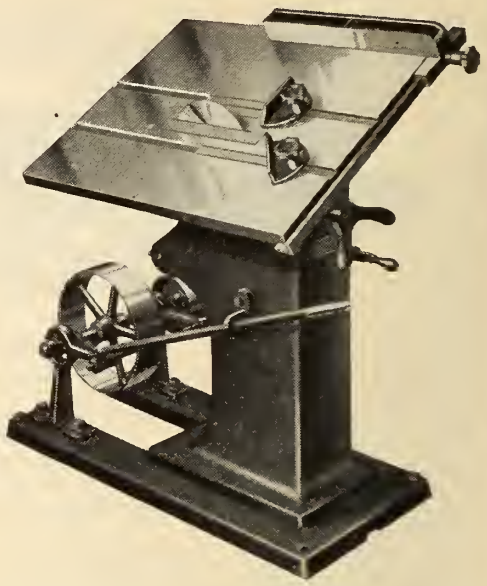
All iron frame and table, accurately machined and fitted insuring good work.

A light inexpensive machine, handy and simple to operate and one which will turn out a great variety of work.

Sold complete as shown or without drilling attachment which is used by manufacturers of beekeepers' supplies. For further particulars apply to any reliable machinery dealer or to the manufacturers.

D. McKenzie Machinery Company, Guelph, Ont.

The "WILLIAMS" Saw Table



The "Williams" Light Variety Saw Table will prove of interest to the Furniture Manufacturer for Assembly and Repair Departments, Small Jobbery Shops, Repair Shops, Pattern Makers' Shops, Beekeepers Supply Shops, Shipping and Factory Maintenance Departments, and a number of other uses where a rapid and accurate tool is required for light work.

HERE ARE SOME SPECIAL VALUES

SINGLE SURFACE PLANERS

1—New 20" eclipse, top and bottom rolls driven.
1—Used Harper 16", top rolls only driven.
1—Preston 24" str. roll, No. 121, Used.
1—Used 24" Cowan, double belted.
1—New No. 123A, Preston, Ball-...bearing, sectional rolls, sectional chipbreakers.

PLANERS AND MATCHERS

1—Used Harper, 24".
1—Used 24" Cowan Double Surface short bed.
1—New Fay & Egan No. 112 Lightning Flooring Planer.
1—Used Cowan 24", long bed type.

BAND SAWS

1—New Moak, 36" with aluminum top wheel.
1—36" Yates Used.
1—26" Cowan, New.

If It's Machinery—Write "Williams"

MISCELLANEOUS

1—New No. 107 Crescent Woodworker, five machines in one; 26" band saw, 12" jointer, saw table, boring machine, shaper.
1—New Beach contractor's woodworker—saw table, jointer, boring attachment, portable.

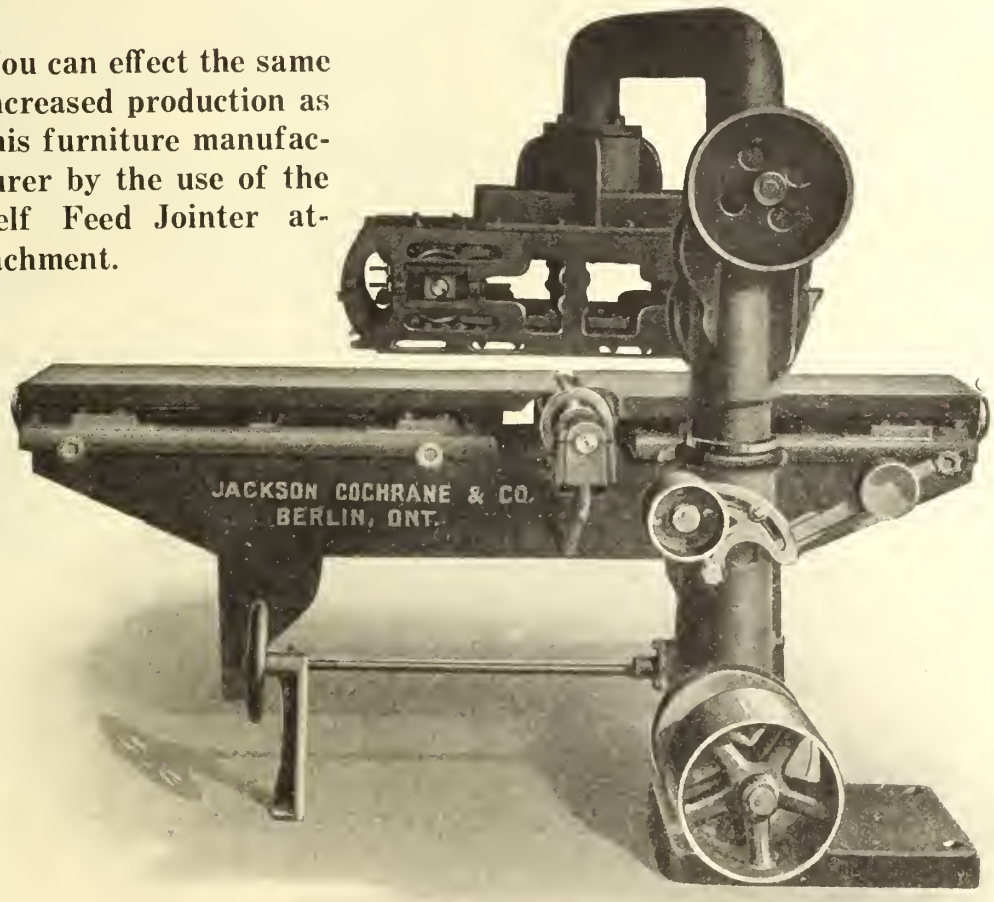
"We can Feed from Two to Three Times as Fast as Formerly"

You can effect the same increased production as this furniture manufacturer by the use of the Self Feed Jointer attachment.



For factories having but one or two jointers and desiring to use same at times for squaring or edging, this Herzog Swing Out Jointer Attachment is especially desirable, as the attachment can be quickly swung free from the jointer.

It is the same general design as the four post machine except that the feed is shorter and is hung from a single post. We guarantee this machine to increase the capacity of the hand fed jointer from THREE TO FOUR TIMES.

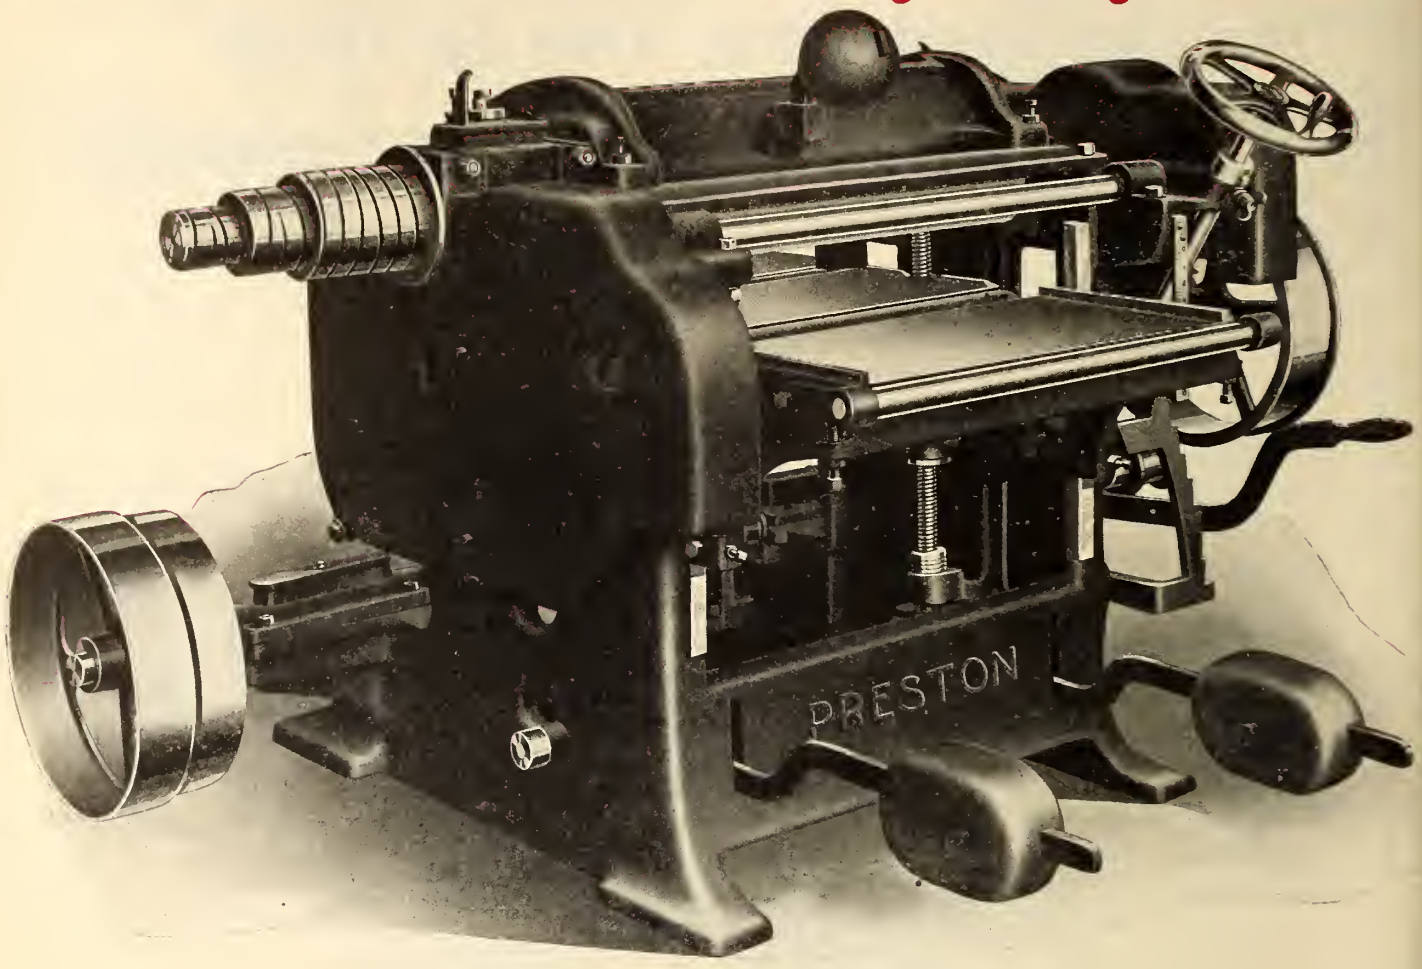
One user writes "We would not be without this machine as it has proven one of the very best machinery investments we have made.

Read over the article on the Self-Feed Jointer Attachment contained elsewhere in this paper.

Jackson, Cochrane & Company

KITCHENER - CANADA

No. 121 "Preston" Heavy Pony Planer



Cut Showing Standard Machine (note Guards)

This is our No. 121 Planer of improved design as now built

Planes 20″ and 24″ wide. 8″ thick

Features:—

1. Built with Straight Rolls (Standard Machine)
   or Divided Roll
   or Sectional Roll and Sectional Chipbreaker
2. Built with Square Cylinder with 2 carbon knives (Standard Machine)
   or Round Cylinder with 4 High Speed Knives.
3. Equipped with Whitney Type Babbitt Bearings (Standard Machine)
   or Specially selected SKF Ball Bearings.
4. Equipped with Stockbridge Electric Knife Grinder if desired, at extra cost.

Cylinder driven from one or both ends.

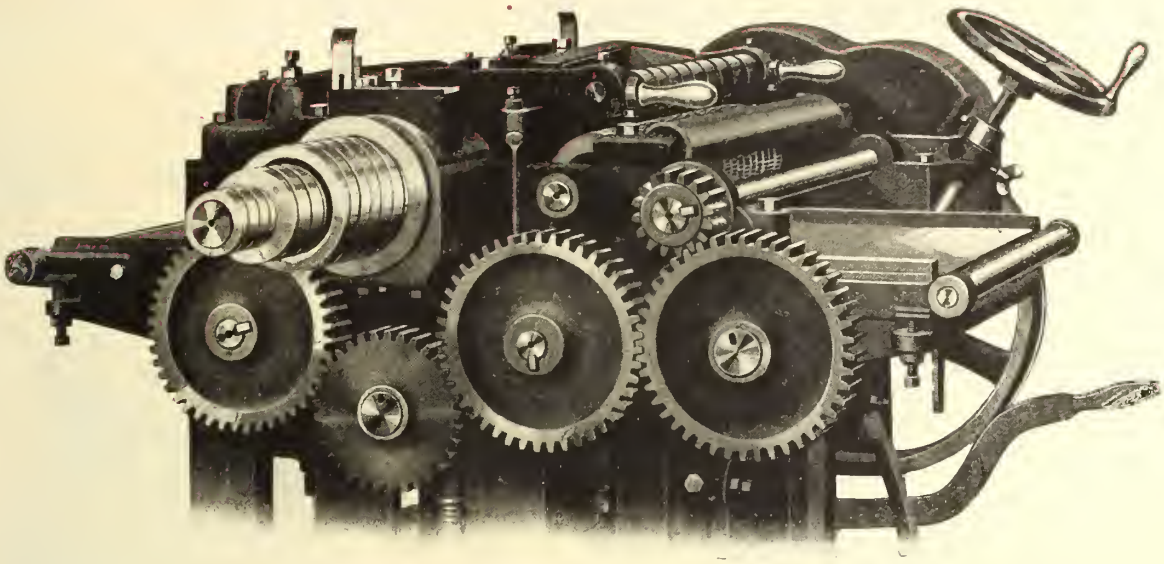
Every known improvement is embodied in this "Preston" Planer and in it we have produced a small planer which in quality and quantity of work produced will compete successfully with larger and higher priced machines

The Preston Woodworking

PRESTON,

We are Sole Manufacturers of and Agents in Canada for the Eaglesfield Patented Beltless Swing Saw

No. 121 "Preston" Heavy Pony Planer



Above cuts show Machine equipped with

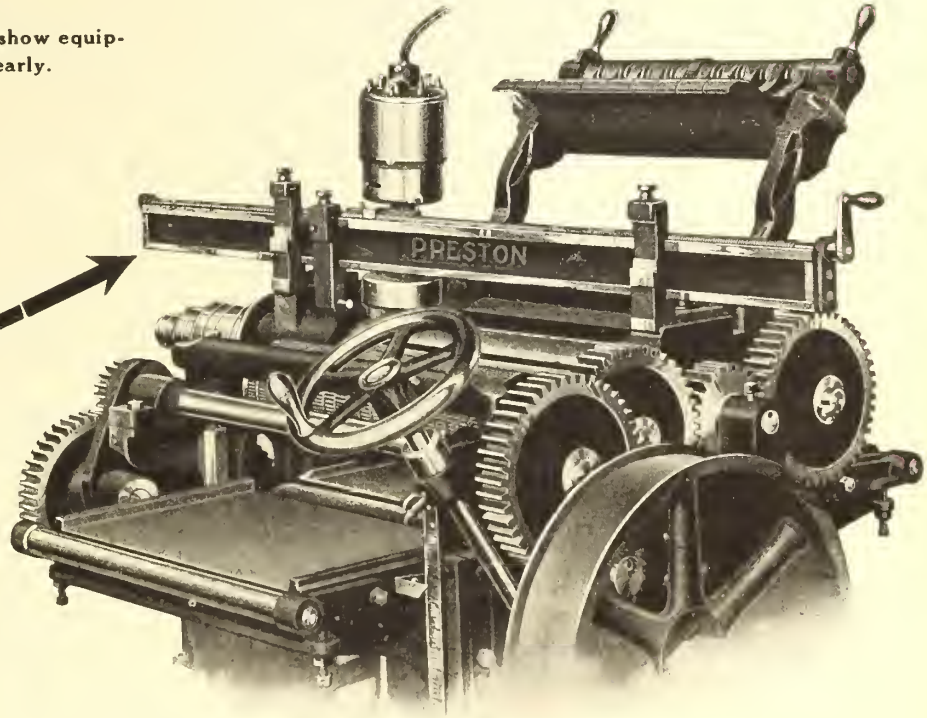
1. Specially selected SKF Ball Bearings.
2. Round Cylinder with 4 High Speed Knives.
3. Sectional Roll.
4. Sectional Chipbreaker.

N B. Guards are removed to show equipment and construction more clearly.

Cut at right is same as above but shows machine equipped as well with

Stockbridge Electric Knife Grinder and Jointer

with which the Cylinder Knives are ground and jointed right in their place on the machine.



We would like to talk "Planer" to you whenever you are in the market

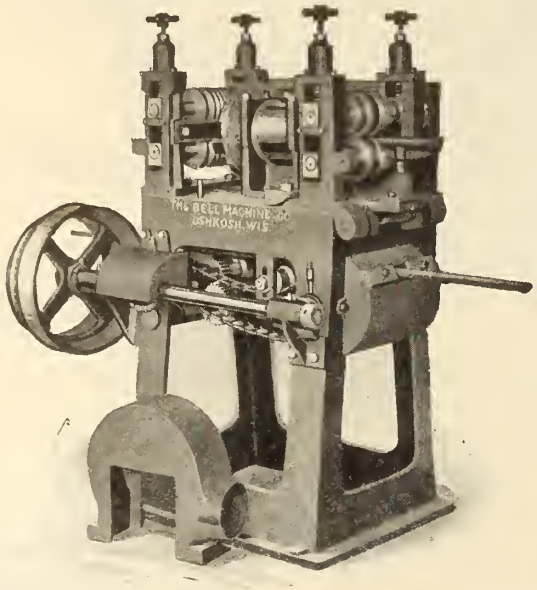
Specialists in Ball Bearing Woodworking Machinery

Make Your Own Dowels With the "BELL" Machines

The Fastest and Most Practical Equipment For the Purpose



Adjustable Rod and Dowel Machine

The fastest dowel machine in the world.

Constructed to withstand the heavy and constant strain to which this type of machine is subjected.

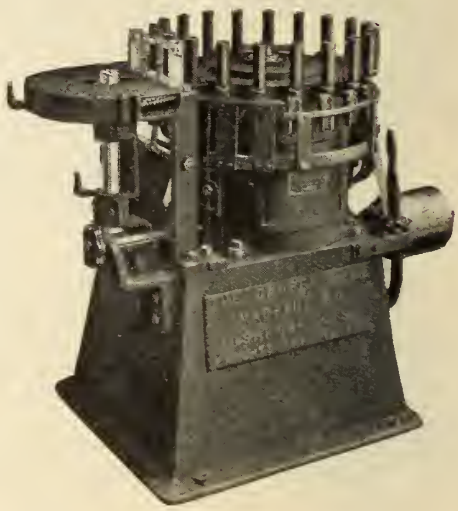
Equipped with a universal four-knife cutter head adjustable to turn rods of all diameters from ¼" to 2" in either plain, spiral groove, longitudinal groove, or imitation reed wind. Special machine for turning rods of larger size.

Cutter-head mandrel is mounted at each end in ball-bearings of the highest grade.

Out-going feed rolls have combination of grooves so that many sizes can be made without changing feed rolls. The in-going feed rolls are adjustable for all sizes of squares.

Will work stock as short as 4½ inches.

Furnished with countershaft or motor drive.



Dowel Cutting Off and Pointing Machine

This machine is for cutting off and pointing dowel pins from long rods.

It will cut and point dowel pins of all diameters up to ¾", and in any length up to 6 inches.

Capacity of this machine is from 300 to 400 pins a minute. Any boy can operate it.

All working parts are completely enclosed and thus protected from dust and dirt.

Absolutely no danger to operator.

The floor space required by this machine is only 22" x 36".

Tight and loose pulleys on machine.

Furnished with belt or motor drive.

National Kilns Under Construction

Below we show a cut of three National Automatic Humidity Controlled Dry Kilns being constructed at the plant of the Watt Milling & Feed Co., Ltd., Toronto, Ont.

This firm manufactures an excellent line of hardwood flooring, sash, doors, interior trims, etc. Their requirements for dry kilned lumber cover a wide range of species and thicknesses; therefore their kilns must be flexible, so as to enable the operator to secure the various conditions required in the proper drying of the many classes and thicknesses of hard and soft woods.

It was only after a thorough investigation and careful consideration that the Watt Milling & Feed Company came to the conclusion that the NATIONAL AUTOMATIC HUMIDITY CONTROLLED KILN was the Best kiln for their particular requirements. The National is not a One-way dry kiln. Its operation is absolutely under control of the operator and the exact conditions required for drying any class of woods can be secured and maintained at his option. It is designed for power—plus flexibility.

"The First Kiln in 6,000 Years in Which Humidity is Automatically Controlled."

If you are in need of new kilns or the improving of your present installation, we will appreciate the opportunity of working with you. Kindly write to-day and give us details as to your problems. This will not obligate you in any way.

SIMONDS
CIRCULAR AND BAND
SAWS

In every mill or woodworking shop in the land the demand for greater production is urgent. Devious methods to secure the desired results are being tried out. Some are making good—some are not. They have the manpower, but they can't get production. Many mills and woodworking shops have discovered one of the greatest hindrances to efficient operation are poor saws and knives. The saws dull easily and do not hold their tension, while the knives lose their cutting-edge quickly and this results in unsightly marks on the lumber, and consequently damage.

Inferior saws and knives are being discarded by many, and in most cases Simonds Products are replacing them. There is no question about Simonds Saws and Knives They are made of the finest steel obtainable, hardened and tempered right and make mechanically perfect. They produce smooth lumber and cut down your operating expense.

Write for catalog and prices.

MAKERS OF

SECTIONAL BOOKCASES, FILING CABINETS IN WOOD AND STEEL, STATIONERS' SUPPLIES.

CINCINNATI

May 15, 1922.

The Standard Dry Kiln Co.,
Indianapolis, Ind.

Gentlemen:-

Feeling that you, like myself, or any other normal human being, would derive a certain amount of pleasure from a word of appreciation for an act or service well done, I thought it would not be amiss to express my appreciation of work well done by the battery of sixteen moist air compartment kilns installed by your Company for The Globe-Wernicke Company.

As the largest manufacturers of Office Furniture in the world we use almost every kind of lumber in commercial use from 5/8" to two inches thick, and as furniture stock is quite valuable our dry kilns have to meet the most exacting requirements.

This material, particularly where joints, mortises, laminations, glued construction, resawing, and shaping are involved, must not only be free from such defects as checks, splits, warp, etc., but must also be free from brittleness, case-hardening, and internal stresses, and dried to a uniform moisture content.

When your Mr. DeGroot was here a few days ago we took a trip through the great mill room. Of all the many kinds of lumber in operation, Ash, Basswood, Beech, Birch, Buckeye, Chestnut, Gum, Mahogany, Maple, Quartered Oak, Plain Oak, Poplar and Walnut we were unable to find one piece that was not perfectly kiln dried. We saw truck loads of gum, oak and poplar, which had been resawed and planed to 3/16 or 1/4 inch thick all lying perfectly flat and straight like so many pieces of metal.

We also had Mr. [redacted] of The Forest Products Laboratory of Madison, Wisconsin, with us this week. He complimented us highly on our drying and stated that we had the finest layout for efficiency that he had ever seen.

I am sending you a number of pieces of different kinds of lumber, cut and tested, showing uniform moisture content. Assuring you of my kindest regards, I am

Very respectfully yours,

THE GLOBE-WERNICKE CO.

W. B. Jones.

Results

Profit—satisfaction—freedom from worry, are what this letter shows in a plant whose quality product justifies your faith in their verdict.

Would you like to know how they handle their drying?— Check your drying system against theirs—we will gladly send you our literature showing their layout, heating system, etc. Get on our free mailing list—Send your own and firm name to us at 1542 McCarty St., Indianapolis, Ind.

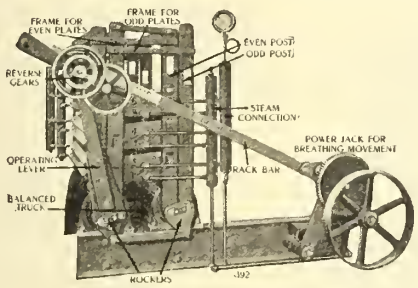
It Pays to Install a "Merit" Re-drier



Bulletin No. 70-C.W.

Re-drying was not practiced to any extent 15 years ago when the "Merit" re-drier made its appearance on the market. Today very few glue rooms take a chance on veneer that has not been re-dried under hot plates and very few plants using veneer have neglected to install a "Merit" re-drier. This machine flattens the veneer and makes it absolutely bone dry. It takes very little steam and is operated by a 2 h.p. motor. It saves glue, simplifies taping and jointing and insures success in the finished product. It is made in several sizes of plate and starting with 4 plates, a machine can later be expanded to 12 or 16 plates.

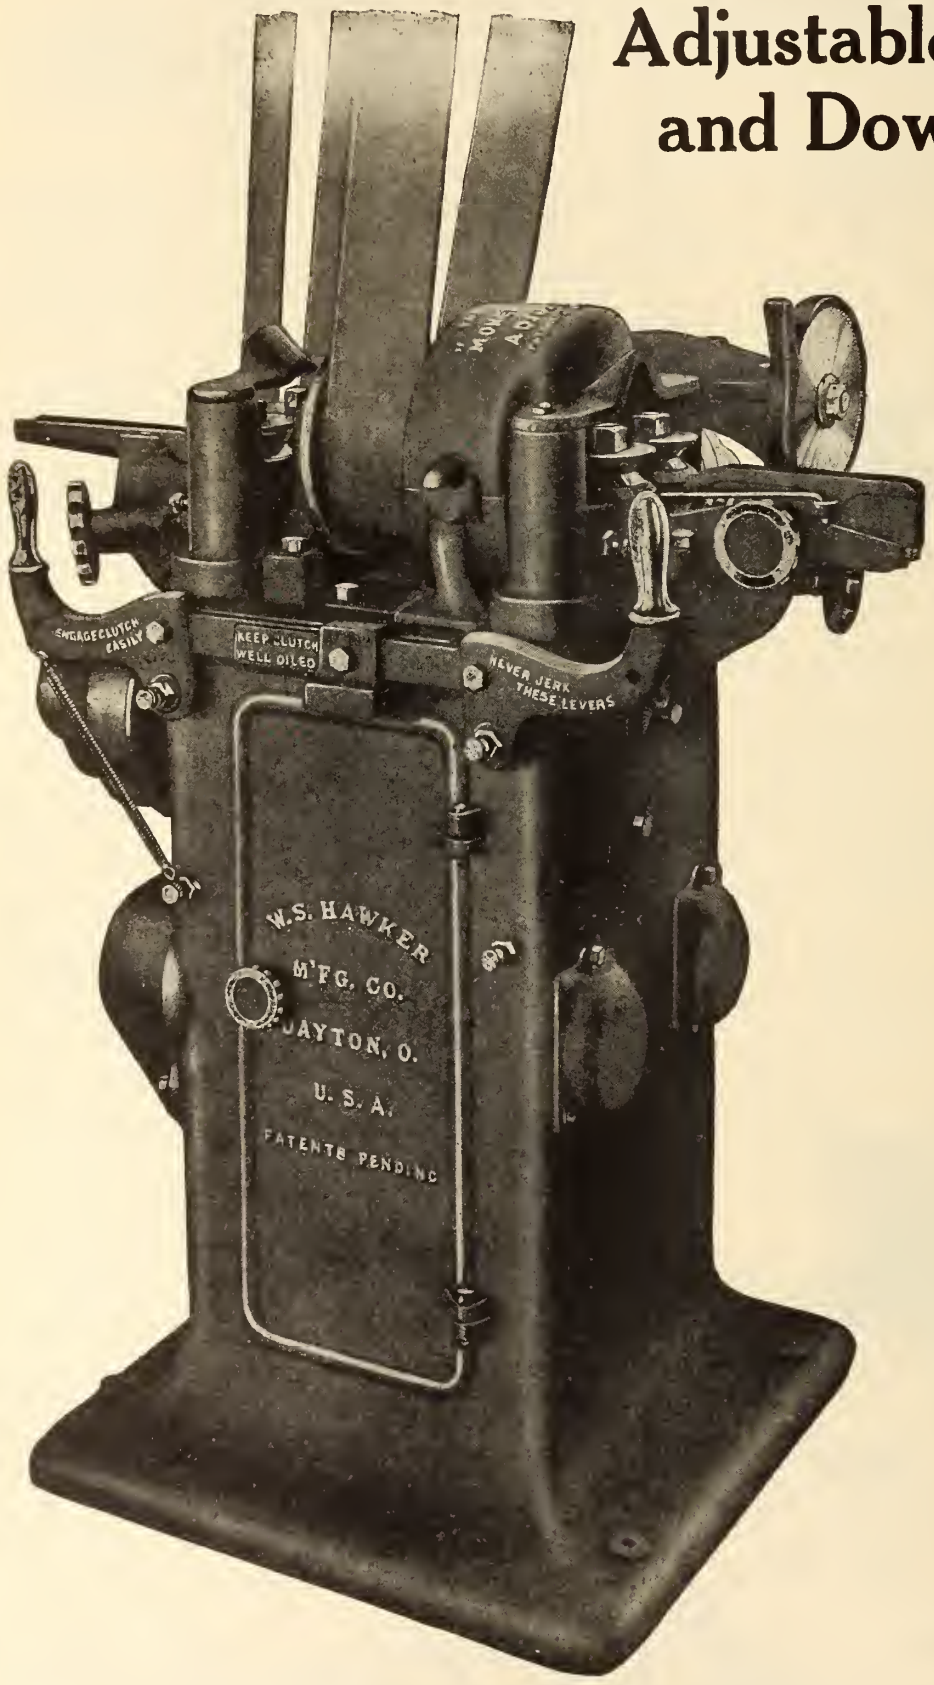
The Money Maker—
Adjustable Rod and Dowel Machine



Capacity 30,000 to 40,000 lineal ft. per ten hours on 7/8 or 15/16 mop or sweeper handle stock.
If you are using any dowel machine of less capacity, figure your daily losses in labor and business.
Write us what dowel sizes you turn, and whether hard or soft wood. Ask for our demonstration proposition to show you how to double your production of dowel stock at the same labor cost.

The machine that is sent under a guarantee to show you a gain of from 100 to 400 per cent before you buy it.
The improved dowel machine that 90 per cent of the largest and oldest machinery builders and dealers now endorse and recommend in preference to the solid chuck machines they themselves previously built.
One cutter head turns from ¼-in. to 2-in. diameter.
Turns hard or soft wood equally well.
Handles heavy, oversized squares.
No choking of the cutter head.
Smooth stock.
Accurate sizes.
Works stock as short as five inches.
Rolls automatically center variations in squares.
Machines built to turn from ⅛ to 6-in.
We want to hear from every user of a solid chuck dowel machine.
We can save you from one dollar out of every two, to four out of every five that the operation of solid chuck machines costs you.
Engagements for competitive test solicited.
Formal orders not solicited. All sales made after demonstration.

The only question is, are you willing to cut cost of your dowel turning to one-half or one-third of what it costs with any make of solid chuck machine?
Machine delivers the goods before you buy.
State conditions of stock closely Special conditions require special equipment.

The ancient Roman war-galley illustrated above was a floating fort with high wooden walls and towers. Trajan's famous ship was really a pleasure resort, a huge floating palace in Lake Nemi, fifteen miles from Rome. Most of it is still on the lake bottom—and no illustration seems to be available.

MONITE Waterproof Glue

The perfected modern form of casein waterproof glue, excels the glues of ancient Rome just as modern carpenter tools of tempered steel surpass the Roman woodworking tools of bronze and iron.

This Glue Held Under Water 18 Centuries!

The following quotation refers to the many-oared boat of the Roman Emperor Trajan, sunk about 100 A.D. in Lake Nemi and recently discovered.

> "I found the timber to consist of pine and cypress, in excellent preservation, which, besides a coating of black pitch, had a double covering of canvas glued on, and over it a sheet of lead fastened with brass nails."—Alberti V. XII fl. XXI.

Other Roman boats found today also show that the Romans master ship builders of antiquity, frequently used casein waterproof glue. Oak frames and pine or fir planking were fastened with copper or bronze fittings; nail heads were cemented over and the seams were calked with pitch, wax, lime, made from sea shells—or with flax. They covered the entire hull with a coating of pitch, a layer of canvas glued on with waterproof glue, and a sheathing of lead fastened with copper or brass nails.

Casein waterproof glue was also used by the Romans for furniture. The ruins of Pompeii have given up many marvelous samples of glue-joint and ply-wood work. Fabulous prices were once paid for rare and beautiful grained citrus-wood such as tiger, panther, wavy or peacock feather pattern. Cicero, the famous orator, paid $27,000 for one large block of citrus-wood; the Cethegi family paid $75,000 for one huge slab—to be used for ply-wood furniture. Much of this Roman furniture is practically like new today.

Monite Waterproof Glue, like the waterproof casein glue of the Romans, makes firm and permanent joints and ply-wood that will resist water, heat and climatic changes for centuries to come.

Ask us to mail you a small sample panel of ply-wood made with MONITE for you to test by boiling, soaking and baking. Write for the panel and our printed matter, NOW.

A Better FINISH

You can improve the appearance and durability of your finishes and increase the saleability of your furniture by using

Cosmos High Grade Lacquers and Lacquer Enamels

Lacquer gives a permanent, waterproof surface that is tough and durable.

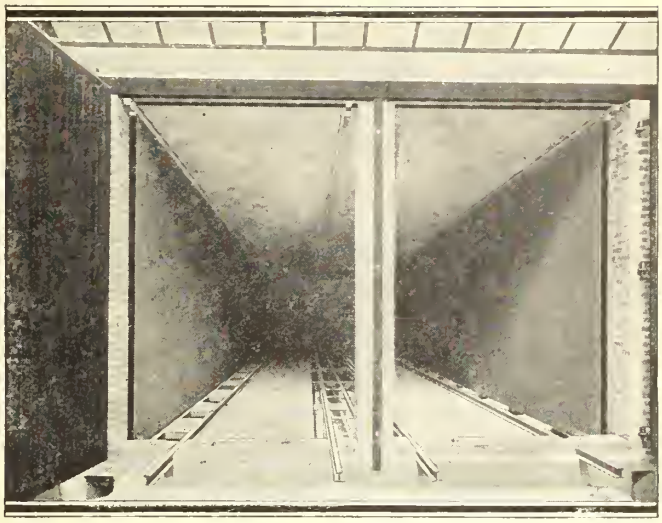
It dries rapidly, increasing the output of the finishing department. Successive coats may be applied at half-hour intervals, enabling work to be finished in one day.

Samples, prices and other particulars gladly furnished.

Our Specialties:

METAL LACQUERS
WOOD LACQUERS
ENAMELS
BRONZING LIQUIDS
EUREKA AIR BRUSHES
AMYL-ACETATE
REFINED FUSEL OIL
COLLODION
BRONZE POWDERS
MATCHLESS METAL POLISHES AND BUFFING COMPOSITIONS
BANANA OIL

Cosmos Chemical Company
Port Hope Ontario



Don't waste money patching old kilns

Modern kilns save money, dry in half the time and produce better quality. Cost very little more than patching.

LOWER costs, quicker deliveries, less delay on special orders will keep your mill going when competitors are shut down. But if your competitor dries in 5 days when you take 10; if his drying costs are 50% lower; if he eliminates all degrade due to Kiln drying, he will be getting your business.

The best patching won't make your old Kilns modern. New Kilns of old design won't save you. The new Cutler Kiln is what you need. 5 Cutler Kilns will have the same drying capacity as 10 of your old Kilns. The same moisture content you secure—10 days, can be had in 5 with a Cutler Kiln. Whenever this is done better quality is the result. The saving—degrade alone, will go along way toward paying for the installation. One of our customers is saving $500.00 per week for each 35 ft. Kiln.

Don't spend a dollar on your old equipment until you have heard our proposition. Write to-day for descriptive matter. Better still, let our Planing Engineer study your particular problem.

All essential features of the cutler kilns are fully protected by mechanical and process patents granted and pending.
